You use the applications in the Service Desk module to manage customer requests for help, information, and services.
- **[Service Level module](#)**  
You use the Service Level module to create and manage service level agreements which document the commitments between service providers and customers. You can also create a service group for each type of service that you provide or procure.
- **[System Configuration module](#)**  
The System Configuration module contains the Platform Configuration module and the Migration module.
- **[Task Management module](#)**  
The Task Management module contains the Activities and Tasks application, which you use to plan, review, and manage activities and tasks. When you create an activity, you initiate the work process and create a historical record of work being performed.
- **[Work Orders module](#)**  
You use the Work Orders module to track the work that has been performed in the past, and future work that is being planned.

---

## Administration module

You use the applications in the Administration module for system administration tasks. You can perform functions such as creating communication templates and setting up organizations.

- **[Sets](#)**  
You use the Sets application to create a framework to share item data and company (vendor) data across multiple organizations.
- **[Organizations](#)**  
You use the Organizations application to set up the organizations and sites that you use. You must define at least one organization and one site.
- **[Calendars](#)**  
Calendars are shared entities that define the framework for shifts, holidays, and so on, for organizations. You use the Calendars application to create and change calendars for organizations and for sites. You can create calendars to define working times as well as shifts. A calendar can also specify non-working time, such as weekends, holidays, and shutdowns.
- **[Resources](#)**  
You use the applications in the Resources module (within the Administration module) to create records about the people in your workforce. The people whom you document can include internal and external workers, and other people whose names or IDs might be listed on other records.
- **[Bulletin Board](#)**  
In the Bulletin Board application, you can create messages about critical problems and incidents that you can broadcast throughout the organization. You can also view communication logs from service desk agents and their users, and communications that are generated by workflow processes and escalations.
- **[Communication Templates](#)**  
You use the Communication Templates application to create and manage communication templates. These templates can be used to standardize frequently used email communications (which are also known as notifications).
- **[Report Administration](#)**  
You use the Reports Administration application to view report listings, set report security, and specify the availability of reports and how they open, run, and print.
- **[Conditional Expression Manager](#)**  
The Conditional Expression Manager application is a library of conditional classes and expressions. You can apply the conditions to fields, tabs, and other user interface controls in applications to control the presentation. You can also apply conditions to security groups to control access to applications, controls, and data.
- **[Classifications](#)**  
Classifications identify and characterize similar objects. A building, a notebook computer, and a centrifugal pump are types of classifications. A classification can also describe an event, such as a broken window or a hard disk failure.
- **[CI Types](#)**  
You use the CI Types application to specify which configuration item (CI) types to use when you import actual configuration items from a discovery tool.
- **[Work View](#)**  
The Work View application queries the combined ticket and work order tables. You can display the results of the query in the Result Set portlet of your Start Center. You can view a list of all tickets and work orders that you own or that are assigned to your group. The Work View application contains one default query, called WORKVIEW.
- **[Service Address](#)**  
You can use service addresses to organize customer locations and assets by address. When you organize customer locations and assets by service address, searching for and finding them is faster.
- **[Map Manager](#)**  
You create and configure maps to provide users with a visual representation of their work.
- **[KPI](#)**  
The KPI Templates application and the KPI Manager application help you assess and monitor the performance of important activities in your organization. For example, you can create KPIs to monitor the number of work orders that are past their scheduled start date or to identify activities that might require improvement.
- **[Record Release](#)**  
In the Record Release application, you can view the records that users currently have in edit mode. You can also release records from edit mode if they are

- left in edit mode erroneously.
- [Time Zone Rules](#)  
In the Time Zone Rules application, you can specify time zone rules to identify the local date and time when you create records for a process, such as generating work orders from a preventive maintenance record.
- [Maximo Visual Inspection models](#)  
You can train accurate and efficient AI-based models in Maximo Visual Inspection.

---

## Sets

You use the Sets application to create a framework to share item data and company (vendor) data across multiple organizations.

The item and company master records exist at the organization level so that organizations can share the same data. These records are stored in sets, which are stored at the database level.

Grouping items into sets allows users to transfer items among sites within different organizations. Grouping companies into sets ensures that all sites and organizations use consistent names for vendor companies and that accurate consolidated vendor reporting can be performed. The following table describes item sets and company sets.

Table 1. Item sets and company sets

Type of set	Description
Item set	<ul style="list-style-type: none"><li>• Lets organizations choose from a common set of items.</li><li>• Unique identifiers are required for each item set and for each item in the set.</li><li>• Items that you create are cataloged into the item set that is associated with the same organization to which your default insert site belongs.</li></ul>
Company set	<ul style="list-style-type: none"><li>• Ensures that all sites and organizations use consistent names for vendor businesses.</li><li>• To negotiate the best prices with vendors, company sets allow you to consolidate vendor reporting and share pricing information when you purchase products or services.</li></ul>

---

## Organizations

You use the Organizations application to set up the organizations and sites that you use. You must define at least one organization and one site.

For each organization, you specify the following properties:

- Base currency
- Default item status
- Item and company sets
- General ledger clearing account
- Address codes for organizational units, including sites, that you can use on records

When your system configuration includes multiple organizations and sites, your company can run the system in multiple facilities from the same database. Using a web browser, each site can access its own site-specific data and common data across the multiple sites.

The architecture of the system enables different organizations and sites to keep parts of their operations separate, while sharing others. For example, different facilities can share purchase agreements and vendors, and share and transfer items, while keeping work order data and job plan data separate.

---

## Organizations and sites

Organizations and sites are logical divisions of a company. The divisions are determined by the types of operations that are performed at different locations, and what data can be shared among them.

An organization is a major division of a company that contains one or more sites. Sites that belong to the same organization must use the same currency. These sites must share the same options for work orders, assets, labor, and other types of data.

A site is a subdivision of an organization that can track inventory and other data separately from other sites. Certain types of information are unique to a site and not visible to other sites within the organization.

---

## Application options

Within the Organizations application, you set defaults for various options that are related to applications or groups of applications, such as Work Order Tracking, Inventory, Purchasing, Preventive Maintenance, and Assets.

When you set certain application options, you must select a site. The setting for that application then applies at the site level. If you do not select a site, then the application setting applies at the organization level. The exceptions to this are system and set level autonumbering, and settings specified in the System Settings window.

---

## Calendars

Calendars are shared entities that define the framework for shifts, holidays, and so on, for organizations. You use the Calendars application to create and change calendars for organizations and for sites. You can create calendars to define working times as well as shifts. A calendar can also specify non-working time, such as weekends, holidays, and shutdowns.

You can create site-specific calendars with names that refer to the site, and have the site agree to use only those calendars. You can define shifts with complex repeating patterns using the Define Pattern window.

You can associate the calendars with types of records. Any number of the following records can reference a single calendar:

- Organizations
- People
- Labor
- Assets
- Locations
- Work orders
- Preventive maintenance
- Tools
- Service level agreements

A calendar record is defined by a start date and end date, and by the shift definitions and non-working time that you apply to it. Non-working time includes holidays and any other type of non-working time that you want to define. Applying shifts and non-working time to a calendar generates the work periods for the calendar.

You are likely to need multiple calendar definitions. For example, you might use a corporate calendar that includes standard shifts and holidays. You could also use an asset calendar that includes a working time calendar for asset uptime.

Information for individuals, such as vacation, sick, personal time, and extra time worked, is not stored on the main calendar record. You use the People application or Assignment Manager to track these exceptions to the standard calendar.

---

## Resources

You use the applications in the Resources module (within the Administration module) to create records about the people in your workforce. The people whom you document can include internal and external workers, and other people whose names or IDs might be listed on other records.

- [Labor](#)  
You use the Labor application to create, change, view, and delete labor records for employees and contractors. Labor records can contain personal and work-related information, as well as the type and location of work, procurement card information, and overtime refused by the laborer.
- [Qualifications](#)  
You use the Qualifications application to create qualifications and certification requirements for qualifications. A qualification is often indicated by a license or certificate that signifies proficiency in a particular skill.
- [People](#)  
You use the People application to create, to modify, to view, and to delete records for individuals. The People application stores information about individuals, such as users, laborers, asset owners, and supervisors who receive workflow notifications.
- [Person Groups](#)  
You use the Person Groups application to manage the groups of workers within your organization.
- [Crafts](#)  
You use the Crafts application to define craft records for a work plan, and to define skill levels, standard rates, and premium pay codes for crafts. The craft code reflects the type of work that employees and contractors perform.
- [Crew Types](#)  
A crew type consists of the required positions, qualifications, and tools that are required to perform a specific type of work. You can assign crew types anywhere that you can assign a craft and skill level.
- [Crews](#)  
You define crews from crew types and assign labor and tool resources to manage the crews.

---

## Labor

You use the Labor application to create, change, view, and delete labor records for employees and contractors. Labor records can contain personal and work-related information, as well as the type and location of work, procurement card information, and overtime refused by the laborer.

In addition, you can specify crafts, skill levels, qualifications, and certifications that are associated with labor records.

Before you create a labor record, you must create a corresponding person record. You create person records in the People application.

- [Labor overview](#)  
Labor records are useful for tracking labor, analyzing labor, and recovering labor costs associated with assets or parts under warranty. After you setup labor records, you must register them in the Security application to assign privileges and restrictions on the applications persons can access.
- [Working with labor](#)  
Crafts are used to identify skill levels, standard rates, and premium pay codes for crafts in forecasting budget requirements. With crafts and qualifications in place, you can create job plans identifying the skill type required for each task, which helps in planning, scheduling, and assigning work.

---

## Labor overview

Labor records are useful for tracking labor, analyzing labor, and recovering labor costs associated with assets or parts under warranty. After you setup labor records, you must register them in the Security application to assign privileges and restrictions on the applications persons can access.

- **[Labor records and person records](#)**  
Similar to person records, labor records contain personal information, but are designed to store information about the worker, such as craft, skill level, hours worked, certifications, and so forth. On the other hand, person records contain personal information, and general information, such as workflow and purchasing information.
- **[Assignment of calendars to labor](#)**  
A calendar specifies the days when work is performed and includes non-work days, such as weekends or holidays. You can assign a calendar to a labor record to specify the work days for a laborer. You can designate a shift to specify the work hours for the laborer.
- **[Status of qualifications](#)**  
When you no longer need a qualification record, you can change the status of that record to inactive.
- **[Zero year to date hours associated with labor](#)**  
In the Labor application, you use the Zero Year to Date Hours action to track the hours that associated with a labor record during a calendar or fiscal year.
- **[Labor inventory locations](#)**  
A labor inventory location maintains a balance of inventory items that were issued from a storeroom.
- **[Status of labor records](#)**  
The status of a labor record indicates whether the record is active, inactive, closed, or canceled.
- **[Deletion rules for labor](#)**  
To meet your changing business needs, you can delete labor records.

---

## Labor records and person records

Similar to person records, labor records contain personal information, but are designed to store information about the worker, such as craft, skill level, hours worked, certifications, and so forth. On the other hand, person records contain personal information, and general information, such as workflow and purchasing information.

In the People application, the personal information is stored in database columns that are shared with the Labor application. You can use either the Labor application or People application to add or change the data in these fields.

Before you create a labor record, you must create a corresponding person record in the People application. A person record is unique within the database. A labor record is unique within an organization. A single person record can be listed on labor records in multiple organizations. However, a person record can only be listed on a single labor record within each organization.

---

## Assignment of calendars to labor

A calendar specifies the days when work is performed and includes non-work days, such as weekends or holidays. You can assign a calendar to a labor record to specify the work days for a laborer. You can designate a shift to specify the work hours for the laborer.

A shift specifies the hours when work is performed. There can be one or more shifts associated with a given calendar.

You create calendars in the Calendars application.

---

## Status of qualifications

When you no longer need a qualification record, you can change the status of that record to inactive.

When you associate a qualification with a labor record, the status of the qualification defaults to active. If necessary, you use the Change Qualification Status function to change the status of the qualification.

---

## Zero year to date hours associated with labor

In the Labor application, you use the Zero Year to Date Hours action to track the hours that associated with a labor record during a calendar or fiscal year.

The year to date values are updated each time labor hours are reported for the laborer in one of the following applications:

- Activities tab of the Incidents application, Problems application, or Service Requests application
- Actual Labor tab of the Activities application, Changes application, Releases application, or Work Order Tracking application
- Labor tab of the Quick Reporting application
- Labor Reporting application

Typically you would only use this option at the end of the fiscal year.

---

## Labor inventory locations

A labor inventory location maintains a balance of inventory items that were issued from a storeroom.

To issue inventory items or tools to a laborer, you use the Create Labor Inventory Location action to create a labor inventory location for that laborer. You use the Issues and Transfers application to issue or transfer inventory items and tools to locations.

For example, a mobile maintenance worker maintains an inventory of spare parts and tools in a vehicle. The worker would be responsible for the parts and tools until they are used on a work order or are returned to a storeroom.

---

## Status of labor records

The status of a labor record indicates whether the record is active, inactive, closed, or canceled.

When you create a labor record, the status of the record defaults to active.

To change the status of one labor record, you use the Change Status action. To change the status of multiple labor records, you select the labor records and then use the Change Status action.

You cannot change the status of a labor record from active to inactive under the following conditions:

- The labor ID is listed on an assignment for a work order that is in any status except closed or canceled.
- The labor ID is listed on a job plan record.
- The labor ID is listed on a work plan for a work order that is in any status except closed or canceled.
- The corresponding person record has a status of active.

---

## Deletion rules for labor

To meet your changing business needs, you can delete labor records.

When you delete a labor record, the qualification associations and qualification history are deleted. If a labor record is listed on another record, instead of deleting the labor record, change the status to inactive.

You cannot delete a labor record if the record meets any of the following conditions:

- The labor ID is listed on a work plan or an assignment for a work order that is in any status except closed or canceled.
- The labor ID is listed as a labor transaction for work order that is in any status except closed or canceled

---

## Working with labor

Crafts are used to identify skill levels, standard rates, and premium pay codes for crafts in forecasting budget requirements. With crafts and qualifications in place, you can create job plans identifying the skill type required for each task, which helps in planning, scheduling, and assigning work.

- [Associating crafts with labor](#)  
In the Labor application, you associate crafts and skill levels with a labor record. Crafts that are associated with labor indicate the skills that the laborer has. When you manage assignments, you can find available laborers with the appropriate skills.
- [Adding qualifications to labor](#)  
A qualification indicates a particular job skill or specialized training. A qualification is often indicated by a license or certificate, signifying proficiency in a skill. You list qualifications on a labor record to indicate that the worker has completed general or specific training.

---

## Associating crafts with labor

In the Labor application, you associate crafts and skill levels with a labor record. Crafts that are associated with labor indicate the skills that the laborer has. When you manage assignments, you can find available laborers with the appropriate skills.

---

### Procedure

1. In the Labor application, select the labor record with which you want to associate a craft.
2. Click the Crafts tab.
3. Click New Row.
4. Specify a value for the craft.  
The pay rate information is displayed in the Rate field.
5. Optional: Specify additional information for the craft, such as skill level, vendor name, and contract.
6. Save your changes.

---

## Adding qualifications to labor

A qualification indicates a particular job skill or specialized training. A qualification is often indicated by a license or certificate, signifying proficiency in a skill. You list qualifications on a labor record to indicate that the worker has completed general or specific training.

---

## Before you begin

You must create the qualification record in the Qualifications application. If the qualification requires a skill level, the laborer must have the matching skill level listed on the labor record.

---

## About this task

You can associate any number of qualifications with an existing labor record in the Labor application. After you save the record, you cannot delete a qualification from the labor record. However, you can change the status of the qualification to inactive.

---

## Procedure

1. In the Labor application, select the labor record with which you want to associate a qualification.
2. Click the Qualifications tab.
3. Click New Row.
4. Specify the qualification and the year that the laborer first acquired competence in the qualification.
5. Optional: Specify a value for the certificate number, and specify additional information about the certificate:
  - a. Press Tab key and specify the validation date for the certificate.
  - b. Specify the effective date of the certificate.
  - c. Specify additional information about the certificate, such as the individual who validated the certificate requirements and the organization that issued the certificate.
6. Save your changes.

---

## What to do next

Some qualifications must be renewed periodically. You use the Extend/Renew Qualification function to renew an existing qualification for a labor record.

---

## Qualifications

You use the Qualifications application to create qualifications and certification requirements for qualifications. A qualification is often indicated by a license or certificate that signifies proficiency in a particular skill.

Using corresponding labor records, you can associate individuals with a qualification. You can also view qualifications associated with a particular labor record and renew and change the status of qualifications.

- [Qualifications overview](#)  
You can create qualifications and certification requirements for qualifications.
- [Working with qualifications](#)  
You can track the qualifications associated with labor, and create qualifications and certification requirements for qualifications. You can also indicate that a laborer is qualified to perform a specific function and associate labor with qualifications.

---

## Qualifications overview

You can create qualifications and certification requirements for qualifications.

- [Status changes](#)  
When you no longer need to use a qualification record, you can change the status of that record to inactive.

---

## Status changes

When you no longer need to use a qualification record, you can change the status of that record to inactive.

---

## Qualification status changes

If you change the status of a qualification to inactive, that qualification cannot be associated with a labor record. However, labor records that are already associated with the qualification are unaffected by this change in qualification status.

In the Qualifications application, you use the Change Status action to change the status of qualifications.

---

## Qualifications status changes for labor

You can change the status of a qualification associated with a labor record. The status change of the qualification is applicable only for that labor record; the overall status of the qualification is not changed.

---

## Working with qualifications

You can track the qualifications associated with labor, and create qualifications and certification requirements for qualifications. You can also indicate that a laborer is qualified to perform a specific function and associate labor with qualifications.

- [Creating qualifications](#)  
To track the qualifications associated with labor, you create qualifications and certification requirements for qualifications.
- [Associating labor with qualifications](#)  
To indicate that a laborer is qualified to perform a specific function, you can associate labor with qualifications.

---

## Creating qualifications

To track the qualifications associated with labor, you create qualifications and certification requirements for qualifications.

---

### Procedure

1. In the Qualifications application, click New Qualification.
2. Optional: If the Qualification field is blank, enter a qualification identifier.
3. Optional: Enter a description of the qualification.
4. Specify the type of qualification.
5. Optional: Provide this information for the certificate:
  - a. If a certificate is required for the qualification, select the Certificate Required check box.
  - b. Specify values such as duration period and required use period.
6. Optional: In the Required Craft and Skill Levels table window, click New Row to specify prerequisite crafts for the qualification.
7. Optional: In the Tools That Require This Qualification table window, click New Row to specify tools that require operators to have this qualification.
8. Save the qualification record.

---

### What to do next

Some qualifications must be renewed periodically. You use the Extend/Renew Qualification function to renew an existing qualification for a qualification record.

---

## Associating labor with qualifications

To indicate that a laborer is qualified to perform a specific function, you can associate labor with qualifications.

---

### Before you begin

To associate labor with qualifications, both the labor record and the qualification record must be active. The laborer also must have the prerequisite crafts and skill levels for the qualification listed on their labor record.

---

### Procedure

1. In the Qualifications application, select the qualification record that you want to associate with a labor record.
2. Click the Associated Labor tab.
3. Specify a value for labor.
4. Specify the first year that the laborer acquired competence in the qualification.
5. Optional: Specify information regarding certification:
  - a. Specify a certificate number.  
This information is read-only when the record is saved.
  - b. Specify the date that the qualification became effective.
  - c. Specify the date that the certificate was validated.
  - d. Specify additional information, such as the person who validated the certificate requirements and the organization that issued the certificate.
6. Save your changes.

---

## People

You use the People application to create, to modify, to view, and to delete records for individuals. The People application stores information about individuals, such as users, laborers, asset owners, and supervisors who receive workflow notifications.

A person record is a record for an individual whose name could appear as a text field value. Workflow assignments are made to roles. All roles resolve to a person, to a person group, or to an e-mail address.

The name of a person is used as the text field value in the Reported By field or in the Affected Person field on a service request, in the Supervisor field on a labor record, or in a Ship To field or Bill To Attention field on a purchasing record.

You must create a person record for any individual who is assigned tasks as part of a workflow process. When you create records in the Labor application and in the Users application, you must create a person record. Person records might have to be created for other individuals who do not have records in the Labor application or in the Users application.

Person records that you create for use as part of workflow processes contain the values in the following fields:

**Supervisor**

The person who oversees or manages the individual. This information is used for escalations.

**Primary E-mail**

The E-mail address where notifications are sent.

**Primary Calendar**

The work calendar that the individual follows. This information is used when determining assignments and escalations.

**Primary Shift**

The shift that the individual works. This information is used when determining assignments and escalations.

**Workflow E-mail Notification**

The circumstances when the individual receive e-mail notifications for task assignments. The default value is PROCESS.

**Workflow Delegate**

The person identifier of the individual designated to receive assignments when the primary individual is unavailable for an extended time (for example, on vacation or on sick leave).

**Delegate From and Delegate To**

The time period when workflow processes route assignment to the delegate. If these fields are empty, all workflow assignments are routed to the delegate.

- [People overview](#)  
The People application stores information about individuals, such as users, laborers, asset owners, and supervisors who receive workflow notifications.
- [Working with people](#)  
You can create people records, change the status of people records, change the availability for people records, view the history of people records, and view related assets and locations.

---

## People overview

The People application stores information about individuals, such as users, laborers, asset owners, and supervisors who receive workflow notifications.

- [Person statuses](#)  
There are two person statuses: active and inactive. A person must be active to be assigned to a labor record or a user record. Inactive persons do not appear in select value lists.
- [Deletion of person records](#)  
To manage the personal and official information for the individuals in your organization, you can delete person records. You can also change the status of a person record to inactive rather than delete the record.

---

## Person statuses

There are two person statuses: active and inactive. A person must be active to be assigned to a labor record or a user record. Inactive persons do not appear in select value lists.

The default status of a person record is active.

You cannot change a person status to inactive if the person ID is listed:

- As a supervisor on another person record or job plan record
- As a custodian or a user for an asset or location
- On a ticket record as an owner
- On a communication template or a ticket template
- As a ship to contact or a bill to contact on a purchasing record
- As a member of a person group
- On an assignment or notification on an active workflow process

When you change the status of a person to inactive, the associated labor records and user records statuses are also changed to inactive. However, when you change the status of an inactive person to active, the status of the associated labor records and user records do not change. You must change the status of these records to active in the Labor application and Users application.

---

## Deletion of person records

To manage the personal and official information for the individuals in your organization, you can delete person records. You can also change the status of a person record to inactive rather than delete the record.

You cannot delete a person record if the person ID is listed:

- On a user record or labor record
- Either as a supervisor on another person record or on a job plan record
- As a custodian or a user on an asset or location
- On a ticket record as an owner
- On a communication template or a ticket template

In the People application, you use the Delete Person action to delete person records.

---

## Working with people

You can create people records, change the status of people records, change the availability for people records, view the history of people records, and view related assets and locations.

- [Creating person records](#)  
To store personal and official information, you can create and maintain records about people in your organization, such as users, laborers, asset owners, supervisors, and individuals who receive workflow notifications.
- [Changing the status of multiple persons](#)  
To manage the status of the people working in your organization, you can change the status of multiple persons to either active or inactive.
- [Changing availability for assigned work](#)  
Using calendars, you can indicate when a person is available to be assigned work.
- [Viewing the history of persons](#)  
Each time you change the status of a person record, a history transaction is listed. You can view a read-only history of these changes.
- [Viewing related assets and locations for persons](#)  
You can associate a person record, as an owner or as a custodian, with an asset or location.

---

## Creating person records

To store personal and official information, you can create and maintain records about people in your organization, such as users, laborers, asset owners, supervisors, and individuals who receive workflow notifications.

---

### Before you begin

You create person records for any individual who could appear on another record. However, you must create a person record for each individual who has a labor or user record.

---

### Procedure

1. In the People application, click New Person.
2. Optional: If the Person field is blank, type a unique person identifier.
3. Specify employee and workplace-related information.  
If you change the First Name field or Last Name field, these changes overwrite the nickname in the Display Name field.
4. Optional: Type a nickname in the Display Name field.
5. Optional: Specify workflow and work order information, important dates, and procurement card details.
6. Click Save Person.

---

### What to do next

The information in the Personal section of the person record is shared with the Labor and Users applications. You can enter or change the information in these fields from any of these three applications.

---

## Changing the status of multiple persons

To manage the status of the people working in your organization, you can change the status of multiple persons to either active or inactive.

---

### Before you begin

A person must have an active status to be assigned to a labor record or a user record. Inactive persons do not appear in select value lists, and cannot be assigned to new labor records or new user records.

---

### Procedure

1. On the List tab in the People application, select the Select Records check box.
2. Select the check boxes for the person records that you are changing.
3. Select the Change Status action.
4. Specify a new status.
5. Optional: In the Memo field, type a reason for the status change.

6. Click OK.
7. Click Close.

---

## Changing availability for assigned work

Using calendars, you can indicate when a person is available to be assigned work.

### About this task

---

The calendar and shift determine a person's standard working hours.

### Procedure

---

1. In the People application, access the person whose work hours you want to change.
2. Select the Modify Person Availability action.
3. In the Display From field in the Modify Person Availability window, select the starting date that you want the work dates to display from.
4. In the Work Dates table window, select the date that you want to change the availability for.
5. In the Modify Work Dates table window, change the values in the Start Time field, End Time field, and Work Hours field.
6. Specify a reason code.
7. Click OK.

---

## Viewing the history of persons

Each time you change the status of a person record, a history transaction is listed. You can view a read-only history of these changes.

### Procedure

---

1. In the People application, access the person record whose status history you want to view.
2. Select the View History action.
3. View the information and click OK.

---

## Viewing related assets and locations for persons

You can associate a person record, as an owner or as a custodian, with an asset or location.

### About this task

---

After you create these associations in either the Locations application or Assets application, you can view a read-only list of assets and locations associated with the person record.

### Procedure

---

1. In the People application, access the person's record whose assets and locations you want to view.
2. Select the View Related Assets and Locations action.  
In the View Related Assets and Locations window, you can view the assets and locations information.
3. Click OK.

---

## Person Groups

You use the Person Groups application to manage the groups of workers within your organization.

A person group can be the recipient of a document that is routed by a workflow process. If a document is routed to a person group, everyone in the group receives the document, unless you configure the process to send the document only to the person whose calendar indicates availability.

A primary member of a group who is designated as a group default cannot be deleted.

You can assign roles to person groups using the Roles application. You can also use the Work Order application to assign a person group to a work order or use the Service Requests/Incidents/Problems application to assign a ticket to a person group.

- [Person group overview](#)  
A person group consists of people who might or might not be workers. After you create a person group, you can designate it as a work group, an owner group on a work order, or an owner group on a ticket.

- [Working with person groups](#)

You can create, view, and change person records. A person group can be the recipient of a document routed by the Workflow application.

---

## Person group overview

A person group consists of people who might or might not be workers. After you create a person group, you can designate it as a work group, an owner group on a work order, or an owner group on a ticket.

- [Person groups](#)

A person group is a list of individuals with similar job responsibilities, levels of authority, and security clearances. When person groups are defined, responsibility for records such as tickets and work orders, can be assigned to a group. A person group can also receive a record routed by a workflow process.

- [Deletion rules for person groups](#)

As your business needs change, you can delete person groups.

---

## Person groups

A person group is a list of individuals with similar job responsibilities, levels of authority, and security clearances. When person groups are defined, responsibility for records such as tickets and work orders, can be assigned to a group. A person group can also receive a record routed by a workflow process.

The member of the group who receives a routed record depends on the calendar and shift. For example, if a purchase order or a work order is routed to a person group, everyone in the group can receive the record unless the workflow process is configured to send it only to the member whose calendar shows that he or she is available. When you create person groups, you also can define one or more alternates for each person in the group.

---

## Deletion rules for person groups

As your business needs change, you can delete person groups.

In the Person Groups application, you use the Delete Person Group action to delete person groups.

You cannot delete a person group if the person group ID meets any of these conditions:

- The person group ID is listed on a work order or ticket that is in any status except closed or canceled.
- The person group ID is listed on any activities on a ticket template with a status of active.
- The person group ID is listed on a communications template or a ticket template.
- The person group ID is listed on a service group as the contact group.
- The person group ID is listed on a preventive maintenance record or job plan record.
- The person group ID is listed on an assignment or notification on an active workflow process.
- The person group ID is listed on an organization record as the site contact group.

---

## Working with person groups

You can create, view, and change person records. A person group can be the recipient of a document routed by the Workflow application.

- [Creating person groups](#)

You use the Person Groups application to create groups of people. After you create these groups, you can assign the groups ownership of tickets and work orders.

- [Specifying alternate persons for notifications and workflows](#)

To ensure availability, you can specify alternate persons for notifications and workflow assignments.

---

## Creating person groups

You use the Person Groups application to create groups of people. After you create these groups, you can assign the groups ownership of tickets and work orders.

---

## Procedure

1. In the Person Groups application, click New Person Group.
2. In the People table window, click New Row to add persons to the group.  
You can add a person multiple times to a person group within the same level, such as within multiple sites or within several organizations.
3. Specify a value for the person.
4. Optional: To use the person for a specific organization or site, specify a value in the Use for Organization field or Use for Site field.  
These values are used to determine whether to route a workflow assignment or a notification to a specific person at an organization or site.
5. Optional: To designate default settings for the person, select these options:
  - a. To designate the person as the default person for an organization or a site, select the Organization Default checkbox or Site Default check box.

- You can designate only one person as the default for each organization and each site. If you do not select this option, the group default is used.
- b. To designate the person to be the default person for the group, select the Group Default checkbox.
- If you do not select this option, the first person added to the group becomes the group default.
6. In the Sequence field, specify a numeric value to indicate the assignment sequence for the person.
  7. Optional: In the Alternates table window, click New Row to add people as alternates for notifications and workflow assignments.
  8. Save your changes.

---

## Specifying alternate persons for notifications and workflows

To ensure availability, you can specify alternate persons for notifications and workflow assignments.

### About this task

---

You can specify alternate persons for each primary member in the person group. Each primary member can have one or more alternate persons.

### Procedure

---

1. In the Person Groups application, select the person group for whose members you want to specify alternates.
2. In the People table window, select the person for whom you want to specify alternate persons.
3. In the Alternates For table window, click New Row to add alternate persons.
4. Specify a person identifier.  
When you enter the person identifier, the following information is displayed: name of the person, the calendar, and shift information.
5. In the Sequence field, specify a numeric value to indicate the assignment sequence for the person.
6. Save your changes.

---

## Crafts

You use the Crafts application to define craft records for a work plan, and to define skill levels, standard rates, and premium pay codes for crafts. The craft code reflects the type of work that employees and contractors perform.

You also can:

- Associate labor records with crafts and skill levels
- Specify multiple skill levels for each craft

To distinguish between a junior level mechanic and a senior level mechanic, you do not create two separate craft records. You can create a one mechanic craft record and set up junior and senior skill levels within the mechanic craft. Each skill level within the mechanic craft can have different standard rates.

- [Crafts overview](#)  
Craft records define skill levels, standard rates, and premium pay codes for crafts.
- [Working with crafts](#)  
You create craft records to define skill levels, standard rates, and premium pay codes for crafts. You can associate craft records with labor records.

---

## Crafts overview

Craft records define skill levels, standard rates, and premium pay codes for crafts.

- [Standard rates and premium pay codes](#)  
In the Crafts application, you can specify standard rates for each craft, and add premium pay codes for premium pay rates.
- [Disassociation of labor records from craft records](#)  
Crafts that are associated with labor indicate the skills that the laborer has. If a laborer no longer has a craft, you can disassociate that craft from a labor record. When you manage assignments, you can find available laborers with the appropriate skills.
- [Deletion rules for crafts](#)  
As your business needs change, you can delete craft records from the database.

---

## Standard rates and premium pay codes

In the Crafts application, you can specify standard rates for each craft, and add premium pay codes for premium pay rates.

### Standard rates

---

Standard rates are used as default rates for a work plan. The following rules apply to standard rates:

- You can specify a standard rate as a general rate for a craft.
- You can specify standard rates for each skill level within a craft.

- You can establish standard rates for external vendors (with or without labor contracts) for crafts and for skill levels within a craft.

---

## Premium pay codes

You can define premium pay codes to reflect situations in which the cost of the labor that is being reported needs to be increased, such as overtime pay, skill pay, or hazardous duty. The following rules apply to premium pay codes:

- Before you can associate premium pay codes with a craft, you must define the premium pay codes.
- You can establish any number of premium pay types and rates for each craft record.
- Premium pay can be calculated as a multiplier, an increment, or as an hourly amount.
- If a premium pay code is defined as applying to all new crafts, the pay code is displayed in the Premium Pay table window of new crafts.

---

## Disassociation of labor records from craft records

Crafts that are associated with labor indicate the skills that the laborer has. If a laborer no longer has a craft, you can disassociate that craft from a labor record. When you manage assignments, you can find available laborers with the appropriate skills.

The following rules apply to disassociating labor records from craft records:

- When you disassociate a labor record from a craft, the labor record is not deleted from the database.
- If a default craft is the only craft with which a labor record is associated, you can disassociate that labor record from its default craft.

---

## Deletion rules for crafts

As your business needs change, you can delete craft records from the database.

The following rules apply to deleting craft records:

- Before you delete a craft record, you must delete all of the skill levels within that craft.
- You cannot delete a craft record that is referenced by job plans, labor contracts, or open work orders.

---

## Working with crafts

You create craft records to define skill levels, standard rates, and premium pay codes for crafts. You can associate craft records with labor records.

- [Creating crafts](#)  
You create craft records in the Crafts application. Craft records define the type of work performed by employees and contractors, and provide detailed information about standard rates, skill levels, and premium pay codes associated with crafts.
- [Associating labor with crafts](#)  
In the Crafts application, you associate labor records with an existing craft. Crafts that are associated with labor indicate the skills that the laborer has. When you manage assignments, you can find available laborers with the appropriate skills.

---

## Creating crafts

You create craft records in the Crafts application. Craft records define the type of work performed by employees and contractors, and provide detailed information about standard rates, skill levels, and premium pay codes associated with crafts.

---

### Procedure

1. In the Crafts application, click New Craft.
2. Optional: If the Craft field is empty, enter a value.  
This value must be unique within an organization.
3. Enter the standard rate for the craft, irrespective of the skill level.
4. Optional: In the Skill Levels table window, click New Row and specify information for skill level, rank, and standard rate.
5. Optional: In the Outside Rates table window, click New Row and specify information for external vendors for the craft or a particular skill level:
  - a. Specify a skill level, vendor, and standard rate for the vendor.
  - b. Select a contract for a vendor.  
If a contract exists, you can change the standard rate only if the contract has not been approved. To create new contracts, use the Labor Rate Contracts application.
6. Optional: In the Premium Pay table window, click New Row and specify premium pay codes and rate types, and change the rates.
7. Save the craft record.

---

## Associating labor with crafts

In the Crafts application, you associate labor records with an existing craft. Crafts that are associated with labor indicate the skills that the laborer has. When you manage assignments, you can find available laborers with the appropriate skills.

## About this task

---

For a work order, specifying a skill level helps to determine the rate that is charged by the labor code, based on the level of expertise. When you specify a skill level, the standard rate for the skill level overwrites the craft rate in the Standard Rate field and Rate field.

## Procedure

---

1. In the Crafts application, select the craft record with which you want to associate a labor record.
2. Click the Associated Labor tab.
3. Click New Row.
4. Specify values for labor, skill level, and rate.
5. Optional: To have the labor rates default to the rate and rate type from the standard and premium pay rates, select the Inherit check box.  
When the check box is selected, the Rate field becomes read-only.
6. Optional: Specify a vendor and a contract.  
You can associate a labor record with a contracted rate only if the contract is approved.
7. Save your changes.

---

## Crew Types

A crew type consists of the required positions, qualifications, and tools that are required to perform a specific type of work. You can assign crew types anywhere that you can assign a craft and skill level.

Hourly rates are applied to crew types to calculate the cost of the work performed by the crew type. The hourly rate for the crew type is used to build job plans to estimate the cost of work, unless an override hourly rate is specified. The hourly rate is automatically updated whenever a change is made to a required position.

A craft and skill level combination corresponds to the minimum labor requirement for the position. A craft and skill level defines a type of labor resource that is used to calculate costs. For example, an overhead line crew type (OHLIN) consists of the following positions: one lineman, a helper, a bucket truck, and a utility trailer. The resources are used to calculate the estimated cost.

Qualifications are skills or certifications that can be specific to a position or appropriate for any crew member. Tools, such as vehicles, are often required to perform the work. Some tools require their users to hold associated qualifications. You also can view qualifications that are associated with any of the tools assigned to the crew type.

You can use the crew type to build a job plan in the Job Plans or Work Order applications. The crew type must have a status of active before it can be used in other applications.

The positions, qualifications, and tools for a crew type are copied to a crew record when you are creating a crew.

- [Defining crew types](#)  
Crew types are used as templates to create crews within the Crews application for planning and estimating work.

---

## Defining crew types

Crew types are used as templates to create crews within the Crews application for planning and estimating work.

## Procedure

---

1. In the Crew Types application, open a new crew type.
2. Specify the name, status, and organization for the crew type.  
For example, CrewType1 has an hourly rate of \$100 an hour, is active, belonging to Organization XYZ.
3. Open a new row and specify the crafts, qualifications, and tools that are required for the crew type.
4. Save the crew type.

---

## Crews

You define crews from crew types and assign labor and tool resources to manage the crews.

- [Crews](#)  
A crew consists of labor and assets that are required to perform work. You use a crew type to build your crew and then assign the required positions, qualifications, and assets that the crew needs.
- [Creating crews](#)  
A crew record specifies the positions, the qualifications, and the tools that are required to perform the assigned work of that crew. You create a crew record to assign these resources to the crew and schedule the time and shift patterns of the crew.
- [Assigning crews and labor to work](#)  
When you assign a crew or labor to work orders or job plans, the requirements are matched to the requirements of the work order.

- [Reporting crew work hours](#)

You can report the hours that a crew worked, the assets that it used, and which work order it did. You can change the crew record if the labors who were originally assigned to the crew did not do the work. Modifying a crew record to report actuals does not change the original crew.

---

## Crews

A crew consists of labor and assets that are required to perform work. You use a crew type to build your crew and then assign the required positions, qualifications, and assets that the crew needs.

When you create a crew, you associate the crew with a calendar and shift. Crew records can be different from the original crew type.

The positions have craft and skill level requirements associated with them, which are the minimum standard for that position. There should be one position for each permanent member of the crew. An individual crew record can add additional positions that were not included in the crew type.

You can assign labor to positions on a crew. A labor can be assigned to only one crew at a time. You can also create overlapping assignments, by assigning multiple labors to the same position for the same time period. Overlapping assignments is useful when, for example, you must add another person to the crew temporarily. You can assign internal labor or outside labor (contractor) to a crew. When you create an overlapping assignment, you can replace the first labor with the second labor or assign both labors to the position.

You assign labor and assets to crews in the Crews application, or you can assign them graphically using the Graphical Crew Management application.

Crews can be assigned anywhere that you can assign a labor, and reporting for the crew can also be done in the same locations.

- [Crew tools](#)  
A tool is a type of inventory item that is associated with a specific asset, such as a bucket truck, fork lift, or trencher. Tools can be associated with a crew to perform a specific type of work.
- [Crew statuses](#)  
The status of a crew record indicates whether the record is active or inactive.
- [Crew availability](#)  
You configure crew availability two ways. One is to define the availability factor for crews, which defines the percentage of a day that the crew is available to work. The second way is to modify availability by specifying times that a crew is unavailable, off sick, or working extra time.

---

## Crew tools

A tool is a type of inventory item that is associated with a specific asset, such as a bucket truck, fork lift, or trencher. Tools can be associated with a crew to perform a specific type of work.

A tool rate defines the cost of an asset. A tool sequence identifies the generic title of a tool, and acts like a placeholder for the tool that is assigned to the crew. The tool sequence must be unique within the crew in an organization.

The asset is identified by a unique asset number. An asset is the unique item that is being used by the crew. For example, a tool might be a truck, and the asset might be the truck with vehicle identification number (VIN) 984887. An asset that is assigned to a crew has a specific start date and an optional end date.

You can define a rate for a tool and for an asset. If a rate is entered for an asset, it overrides any rate specified in the tool rate.

---

## Crew statuses

The status of a crew record indicates whether the record is active or inactive.

If a crew is referenced by an active work order or job plan, you cannot change its status to inactive. When you change the status of a crew from active to inactive, all the assignments of labor and assets for that crew end.

---

## Crew availability

You configure crew availability two ways. One is to define the availability factor for crews, which defines the percentage of a day that the crew is available to work. The second way is to modify availability by specifying times that a crew is unavailable, off sick, or working extra time.

You can configure the availability factors for crews by using the Crew Assignment Options action in the Organizations application. You determine crew availability to calculate the time that is available to complete work. For example, an availability factor of .80 means that crews are available for work assignments 80% of the time. The other 20% of time might be used for meetings or administrative work. The availability factor applies to all crews for every day, and not to a specific crew or a specific date and time.

In the Crews application, you modify crew availability for planning purposes using the Modify Availability action. You update when a crew is available so that you can assign work to them. You can modify the work hours of a crew for a specific day, such as adding extra-hours, sickness time, and vacation. For unplanned or emergency work, you can modify availability to add the extra hours to a shift, and then assign the task to the labor or crew.

---

## Creating crews

A crew record specifies the positions, the qualifications, and the tools that are required to perform the assigned work of that crew. You create a crew record to assign these resources to the crew and schedule the time and shift patterns of the crew.

## Before you begin

---

Define a crew type in the Crew Type application.

## About this task

---

The positions, qualifications, and tools for that crew type are copied to the crew record. The default status of a crew is active.

## Procedure

---

1. In the Crews application, click New Crew and specify the crew name and description.
2. Specify the crew type.
3. Optional: Modify the crew requirements, such as the craft, qualifications, and tools.
4. On the Assigned Labor tab, click New Row and assign labor to the required positions. Or, you can enter an unrestricted row to resolve any assignment conflicts automatically.
5. Optional: Specify assets for tool requirements.
6. Save the record.

## Assigning crews and labor to work

---

When you assign a crew or labor to work orders or job plans, the requirements are matched to the requirements of the work order.

## Procedure

---

1. In the Assignment Manager application, filter the work list to display the work orders to which you want to assign a crew or labor.
2. Select the work orders to which you want to assign a crew or labor.
3. Select the crew or labor to which you want to assign the work.
4. From the Select Action menu, assign a crew or labor to the work order.  
The work list is updated with the name of the labor or crew who perform the work.
5. Add other details of the assignment, such as the start and end dates of the work order.
6. Save the record.

## Reporting crew work hours

---

You can report the hours that a crew worked, the assets that it used, and which work order it did. You can change the crew record if the labors who were originally assigned to the crew did not do the work. Modifying a crew record to report actuals does not change the original crew.

## About this task

---

You can report the hours that a crew works in any application where you can report actuals for labors.

## Procedure

---

1. In the Work Order Tracking application, report the hours that a crew worked. On the Actuals tab, select the Labor tab, and then select Enter Time By Crew.  
When you enter hours by crew, one labor record for each labor, and one tool record for each asset that is assigned to the crew are created. You can adjust labor and crews by adding or deleting those records.
2. Specify the crew that did the work, and the date of the work.
3. Refresh the screen to display the labor, tools, and work orders that are associated with the crew.
4. Optional: Modify the labor, tools, and work order data.
5. Click OK to save the record.

## Bulletin Board

---

In the Bulletin Board application, you can create messages about critical problems and incidents that you can broadcast throughout the organization. You can also view communication logs from service desk agents and their users, and communications that are generated by workflow processes and escalations.

You can specify an audience for a message. If you do, only members of that audience can see the message. You also specify the date and time for the message to appear and to expire.

Recipients can view bulletin board messages from the navigation bar of an application or from the Start Center.

---

## Communication Templates

You use the Communication Templates application to create and manage communication templates. These templates can be used to standardize frequently used email communications (which are also known as notifications).

You can use communication templates in the following ways:

- You can add file attachments or document folders to communication templates. When an email communication is sent, the attachments are included in the email communication, either in a folder or in an attachment.
- You can use communication templates with the workflow process. For example, you might have a workflow process for purchase requisitions that uses a communication template. When a user submits a request for a notebook, the purchase request enters the workflow and must be approved by an immediate supervisor. When the purchase request is approved, the status is set to approved. An email communication is then sent out using the communication template to the user who submitted the request.
- You can use communication templates with the escalation process. For example, when a service desk agent does not complete assignments within six hours, you can create an escalation configuration that uses communication templates. The assignment is escalated to the supervisor, and the supervisor receives an email communication.
- Service desk agents can create and send email communications from the ticket applications (the Service Requests application, the Incidents application, and the Problems application). These email communications are sent by using standardized information from communication templates. The recipients of the email communications can respond. The service desk agents can view the two-way dialog in the communication log in the ticket applications.

---

## Report Administration

You use the Reports Administration application to view report listings, set report security, and specify the availability of reports and how they open, run, and print.

- [Report development](#)  
Reports display important information to help your organization analyze the data that Maximo® Manage generates. The embedded reporting tool is Business Intelligence and Reporting (BIRT). In the Manage Report Development Guide, you can find information on how to install and configure the BIRT report designer, and develop and extend reports. You can also integrate your Manage system with Cognos® or external reporting systems.
- [Administering reports](#)  
You can add reports and data sources, configure reports, manage security, and monitor report performance so that users can quickly analyze Manage data.
- [Ad hoc report administration](#)  
You can specify which users can create and run ad hoc reports and define the types of analysis that users can perform.
- [Ad hoc report creation](#)  
You can quickly create reports to get information for your business needs.

---

## Report development

Reports display important information to help your organization analyze the data that Maximo® Manage generates. The embedded reporting tool is Business Intelligence and Reporting (BIRT). In the Manage Report Development Guide, you can find information on how to install and configure the BIRT report designer, and develop and extend reports. You can also integrate your Manage system with Cognos® or external reporting systems.

---

## Administering reports

You can add reports and data sources, configure reports, manage security, and monitor report performance so that users can quickly analyze Manage data.

- [Adding reports](#)  
After creating a report, use the Report Administration application to register the report to the database so the user can access and run it. If you use the `reports.cmd` command to import all reports, libraries, and resource files, do not individually add reports through this procedure.
- [Report management](#)  
You can prevent users from previewing, creating, or running reports that might affect system performance. Reports can affect system performance if users schedule unnecessary reports, or run reports against too many records or application records, or preview and run reports that query too many records. To prevent users from exporting reports in formats that your organization does not permit, you can define report export options.
- [Importing reports](#)  
Import a BIRT Report Design file (the report file) to either add a new report or bring an updated version of an existing report into your database. Before you import the design file, you must import any associated library files.
- [Importing library files](#)  
Library files contain components that you can use in report designs to provide consistent behavior and performance. Library files are useful when many reports use the same component multiple times. You import a library file before you import the corresponding reports.
- [Adding data sources](#)  
You add data sources so you that can run reports on a reporting or subordinate database.
- [Setting report file security](#)  
You can set security for each report to determine which groups have access.
- [Setting application security](#)  
You can set security for each application to determine which groups have access to reports in that application.
- [Running reports using request pages](#)  
When you run a report, use the Request Page dialog box to enter parameter, schedule, and e-mail information. Enter this information to specify the details of the report, when it will be run, and who will receive it.

- [Creating browser shortcuts for reports](#)

You can create a shortcut so the user can click an icon in the application toolbar to open a report in the browser.

- [Enabling the printing of attached documents](#)

To print Microsoft Office documents with a report, you must enable ActiveX controls through Internet Explorer. You can print Microsoft Office documents that have the following document extensions: .doc, .ppt, and .xls.

---

## Adding reports

After creating a report, use the Report Administration application to register the report to the database so the user can access and run it. If you use the `reports.cmd` command to import all reports, libraries, and resource files, do not individually add reports through this procedure.

---

### Procedure

1. Click the New Report icon.
2. In the Report File Name field, type the file name of the report, with the file extension, exactly as you created it in the report designer.
3. In the Report Type field, select the type of report.
4. In the Application field, enter the application that end users use to run this report. The application name you select determines the application from which the user can access the report and the attribute names of any report parameters.
5. Select the Report Folder field. This field defaults to the value you enter in the Application field.
6. Optional: To add a parameter-based report, add a new row and enter parameter information.  
After you register parameters, the end user can use those parameters to have the system filter data. The report generates only the information that the end user needs.
7. Save the report.
8. Generate the request page to apply the changes.

---

## Report management

You can prevent users from previewing, creating, or running reports that might affect system performance. Reports can affect system performance if users schedule unnecessary reports, or run reports against too many records or application records, or preview and run reports that query too many records. To prevent users from exporting reports in formats that your organization does not permit, you can define report export options.

---

### Application record limits

You can set the maximum number of application records that users can select when they run application reports. In the Report Administration application, open the report. On Report tab, in the Settings section, limit the number of application records that users can select. You can limit application records only for reports without parameters.

---

### Security group limits

To stop the unnecessary execution of huge reports on the report server, you can set report server records limits for users in each security group. The limit includes the application records that the report runs against and any associated child and grandchild records. If a user runs a report and the report server records limit is reached before the report completes, the report execution stops. To set report server records limits select the Set Security Group Limits action. Select the security group, and specify the report server records limit.

To help users manage their scheduled reports more efficiently, and prevent them from scheduling unnecessary reports, you can set a maximum number of scheduled reports for users in each security group. To set scheduled report limits, select the Set Security Group Limits action. Select the security group, and specify the maximum number of scheduled reports.

To prevent the execution of large ad hoc reports while they are being created, you can set the maximum number of application records that power users can preview. To set the ad hoc report records limit, select the Set Security Group Limits action. Select the security group, and specify the maximum number of ad hoc report records that users can preview.

---

### Report cancellation

To maintain system performance, you can monitor reports that are running or respond to escalations that alert you to long-running reports. To monitor reports that are still running select the View Report Processing action. In addition, the REPORTLONG escalation automatically notifies you about reports that are taking too long to complete. The REPORTLONG escalation is configured to automatically notify users in the RPTADMIN role, which is assigned to the REPORTADMIN security group, when reports are running longer than is specified in the escalation.

---

### Report file formats

Users can export files when they execute reports. To specify the file formats that users can export reports to, select the Set Report File Export Options action. Select the default export file format and the export file formats that users can select. After you define the report file formats that users can select, you must restart any servers on which reports are enabled.

---

## Importing reports

Import a BIRT Report Design file (the report file) to either add a new report or bring an updated version of an existing report into your database. Before you import the design file, you must import any associated library files.

---

## Procedure

1. Select the Import Report action.
2. In the Report Design File field, enter the location of the report file you are importing.
3. In the Report Resource File field, enter the location of any resource files, which contain items such as images or external files.
4. Save your changes.

---

## Importing library files

Library files contain components that you can use in report designs to provide consistent behavior and performance. Library files are useful when many reports use the same component multiple times. You import a library file before you import the corresponding reports.

---

## About this task

This procedure applies only to BIRT reports.

---

## Procedure

1. Select the Import Library File action.
2. Optional: In the Existing Library File field, enter the file name of the library. Use this field to import an updated version of a library file.
3. In the Library File field, enter the file location.
4. Optional: In the Report Resource File field, enter the location of any resource files. Resource files contain items such as images or external files.
5. Save your changes.

---

## Adding data sources

You add data sources so you that can run reports on a reporting or subordinate database.

---

## Procedure

1. Select the Configure Data Sources action.
2. Complete the following fields.
  - Data Source Name – The Source Name of the Database on which you want to run reports. You can run reports against any type of database that has a JDBC driver.
  - Database URL – the JDBC connection URL of the database. This URL will vary depending on the database you connect to.
  - Database Driver – the JDBC driver defined for that database.
  - Database User Name – the database user name the server uses to attach to the database server.
  - Database User Password – the password for the Database User Name.
3. Save your changes.

---

## Setting report file security

You can set security for each report to determine which groups have access.

---

## Procedure

1. Select a report.
2. In the Security tab, add a row to the Report Level Security section.
3. Enter a group name in the Group field.
4. Save your changes.

---

## Setting application security

You can set security for each application to determine which groups have access to reports in that application.

---

## Procedure

1. In the Report Administration application, select Set Application Security.
2. In the Applications section, select an application, and add a new row.

3. In the Application Level Security section, you can add, change, or delete security settings for a group.
4. Save your changes.

- [Setting all application security](#)  
You can quickly enable and remove access to reports for security groups in all applications.

---

## Setting all application security

You can quickly enable and remove access to reports for security groups in all applications.

---

### Procedure

1. Select the Set All Application Security action.
2. Specify a security group.
3. Select the type of report that you want to set access for.  
For example, to enable access to BIRT Reports, select the BIRT Reports check box.
4. Save your changes.

---

### What to do next

If you need to remove access to reports for security groups in all applications, select the Remove All Application Security action, and specify the security groups and reports.

---

## Running reports using request pages

When you run a report, use the Request Page dialog box to enter parameter, schedule, and e-mail information. Enter this information to specify the details of the report, when it will be run, and who will receive it.

---

### Procedure

1. In the Parameters section, specify the information to appear on the report. You must specify information for all required parameters.
2. Select a schedule option.
3. If you selected a schedule option that will run the report in the future, enter the e-mail information.

---

## Creating browser shortcuts for reports

You can create a shortcut so the user can click an icon in the application toolbar to open a report in the browser.

---

### About this task

You can create a shortcut only for reports without parameters, such as the Work Order Details report.

---

### Procedure

1. Select a report that has no parameters.
2. In the Toolbar Sequence field, enter a number.  
For example, if you type 1, the icon for this report appears first in the application toolbar. The system validates the number that you enter. You cannot use the same number more than once.
3. Select the Browser View of Report check box.
4. In the Browser View Location field, enter a value. This field determines the application tabs that have an active Browser View icon.
5. Save your changes.  
If you have not previously configured this report to open in your browser, generate the request page.

---

### Results

To check the shortcut, go to the application and locate the Browser View icon on the toolbar. Move the cursor over the icon to see the report name as the tool tip. Users can click this icon to open the selected report in the report browser.

- [Creating printing shortcuts for reports](#)  
When you create a printing shortcut on the application toolbar, you can click the icon once to print a report, instead of clicking multiple times. You can add this function only for those reports without parameter, such as the Work Order Details report.
- [Creating a printing shortcut for reports with attached documents](#)  
When you add the Direct Print with Attachments icon to an application toolbar, you click the icon once to print a report with attachments, instead of clicking multiple times. You can add this function only for those reports without parameters, for example the Work Order Details report.

---

## Creating printing shortcuts for reports

When you create a printing shortcut on the application toolbar, you can click the icon once to print a report, instead of clicking multiple times. You can add this function only for those reports without parameter, such as the Work Order Details report.

### Procedure

---

1. Select a report that has no parameters.
2. Select the Limit Records check box.
3. In the Max Record Limit field, enter the maximum number of records on which a user can run the report.
4. In the Toolbar Sequence field, enter a number to indicate the position of the icon on the toolbar
5. Select the Direct Print check box.
6. In the Direct Print Location field, specify a value.
7. Save the report.
8. If you have not previously configured this report for direct printing, generate the page.

---

## Creating a printing shortcut for reports with attached documents

When you add the Direct Print with Attachments icon to an application toolbar, you click the icon once to print a report with attachments, instead of clicking multiple times. You can add this function only for those reports without parameters, for example the Work Order Details report.

### About this task

---

Attached document files with the following file extensions cannot be printed:

- .ppt
- .pptx

### Procedure

---

1. Select a report that has no parameters.
2. Select the Limit Records check box.
3. In the Max Record Limit field, enter the maximum number of records on which a user can run the report. This value can be any number greater than zero.
4. In the Toolbar Sequence field, enter a number for the order in which the icon should appear in the toolbar.
5. Select the Direct Print with Attachments check box.
6. In the Direct Print with Attachments Location field, specify a value.
7. Save the report.
8. If you have not previously enabled this report for direct printing of attached documents, generate the request page.

---

## Enabling the printing of attached documents

To print Microsoft Office documents with a report, you must enable ActiveX controls through Internet Explorer. You can print Microsoft Office documents that have the following document extensions: .doc, .ppt, and .xls.

### Before you begin

---

In addition to configuring ActiveX controls in your browser, you must also ensure that the Global Value field in the mxe.activex property is set to 1. Use the System Properties application to set this value.

### Procedure

---

1. In Internet Explorer, select Tools, , Internet Options to open the Internet Options window.
2. On the Security tab, click Custom Level to open the Security Settings window.
3. Enable the following ActiveX controls and plug-ins:
  - Automatic Prompting for ActiveX controls
  - Binary and script behaviors
  - Download signed ActiveX controls
  - Download unsigned ActiveX controls
  - Initialize and script ActiveX controls not marked as safe
  - Run ActiveX controls and plug-ins
  - Script ActiveX controls marked safe for scripting
4. Save your settings.
5. Click Trusted Sites, and click Sites to open the Trusted Sites window.
6. In the Add this Web site to the zone field, type the application URL from which you expect to receive attachments.
7. Click Add.

---

## Ad hoc report administration

You can specify which users can create and run ad hoc reports and define the types of analysis that users can perform.

---

### Ad hoc report permissions

Too many ad hoc reports can drain database and application server resources. Therefore, to avoid unnecessary reports, you must carefully manage which security groups can create and run ad hoc reports. You enable security groups to run ad hoc reports or create ad hoc reports, or both, for each application. In the Security Groups application, select a security group, and in the Applications tab, specify an application, and select Run Reports and Create Reports.

---

### Calculation expressions

You can enable calculation expressions in ad hoc reports for each application so that users can perform deeper analysis of data. You enable calculation expressions for each security group. In the Security Groups application, select a security group, and in the Applications tab, specify an application, and enable the calculate tab on ad hoc reports.

---

### Summary expressions

You can enable summary expressions in ad hoc reports for each application so that users can create aggregate functions on fields to simplify their analysis. You enable summary expressions for each security group. In the Security Groups application, select a security group, and in the Applications tab, specify an application, and enable the summarize tab on ad hoc reports.

---

### Ad hoc report expression library

You define an expression library for users to select from when they create ad hoc reports. By defining an expression library, you can ensure that when users create calculation expressions, they can select only SQL expression values that are permitted by the organization. Only specific report administrators must define the expression library. To define the expression library, the ad hoc expression library must be enabled for the report administrator's security group. In the Security Groups application, select the report administrator's security group, and enable the ad hoc expression library. In the Report Administration application, select the Define Ad Hoc Reporting Library action, and define the expression keywords that users are permitted to use.

---

## Ad hoc report creation

You can quickly create reports to get information for your business needs.

You can create ad hoc reports from applications so that the data is filtered for that specific application. If you created an advanced search query in an application, you can apply this query to the report. You can specify the style of the report; select the categories and fields to include; develop calculations; aggregate functions to summarize data; format the report by filtering, grouping, and sorting information; and schedule the report. After you create a report, you can download the data into other formats, such as Microsoft Excel.

To access reports that you created, select the Run Report action. You can run, edit, or delete reports that you select, and specify the users to receive a copy.

---

## Conditional Expression Manager

The Conditional Expression Manager application is a library of conditional classes and expressions. You can apply the conditions to fields, tabs, and other user interface controls in applications to control the presentation. You can also apply conditions to security groups to control access to applications, controls, and data.

Conditions can be class-type or expression-type. Class type expressions are specified in a file. Expression type conditions are entered into the condition library using the expression syntax.

- [Creating conditional expressions and classes](#)  
You can create conditional expression-type and class-type conditions. Then you can apply the conditions to control access to data and to user interface controls.
- [Conditional expression syntax](#)  
You enter conditional expressions using a syntax similar to Structured Query Language (SQL) with some additional variables.
- [Sample conditional class files](#)  
Sample condition class files are stored in a folder under the root directory of the product installation. You can use the sample files when you create class-type conditions.

---

## Creating conditional expressions and classes

You can create conditional expression-type and class-type conditions. Then you can apply the conditions to control access to data and to user interface controls.

---

### About this task

To handle complex operations with multiple conditions, you can create an automation script that contains the condition logic. For more information, see [Automating routine tasks with automation scripts](#). Then, you can create a single condition that references the automation script and applies the condition as needed.

## Procedure

1. In the Conditional Expression Manager, add a row and change the auto-generated Condition identifier to a meaningful identifier. Enter a complete description of the condition in the Description field.  
A meaningful identifier and a complete description help you identify a condition later.
2. Select the condition type and enter the condition.
  - a. If you selected expression type, enter an expression, or click Condition Expression Builder to build an expression in the Condition Expression Builder.
  - b. If you selected class type, enter the class file name. The file must be in a folder under the root of the product folder, for example  
*Maximo\_home\maximo\samples*
3. Save the condition.

## Conditional expression syntax

You enter conditional expressions using a syntax similar to Structured Query Language (SQL) with some additional variables.

When you create a conditional expression, use a colon (:) to define a variable. The colon is used to avoid ambiguity when you create expressions that relate the current record to a different, specific record.

You can have subselect in an expression,

```
exists (select 1 from workorder where wonum=:wonum).
```

The first *wonum* is the *wonum* attribute on the work order object. At run time, the second *wonum* is replaced with the value of the *wonum* attribute for the current record.

## Replacement variables

Syntax	Description	Comments
:yes	true	Logically true, 1 if stored in the database
:no	false	Logically false, 0 if stored in the database
:%date%	Current* date	
:%datetime%	Current date and time	
:%user%	Logged in user	For example, if a user is signed in as Smith, :owner.id=%user% converts to :ownerid= 'SMITH'
:%personid%	Person ID of logged in user	For example, if a user is logged in as Smith, :reportby=%personid% converts to :reportby= 'SMITH'
:%appname%	Application name	For example, in the Work Order Tracking application, :%appname% = WOTRACK converts to WOTRACK = WOTRACK. This variable is useful for setting different behavior for different copies of an application.
:%mboname%	Name of the current business object	For example, in the work order object, object = :%mboname% converts to object = WORKORDER
:%ownername%	Name of the owner business object	For example, in the Work Order Tracking application, :%ownername%.jobplan.priority>%ownername%.priority converts to workorder.jobplan.priority>workorder.priority

## Bind variables

Syntax	Description	Examples
:<relationship name>.<attrname>	Value of an attribute of a related business object of the current business object	:location.description
:%owner%.<attrname>	Value of an attribute of the owner business object	When you apply a job plan to a work order, the system copies the priority of the job plan to the child work order. The condition can be: :%owner%.jobplan.priority>:%owner%.priority. In this example, the system copies this information if the job plan has a higher priority than the parent work order.
:%owner%.<relationship name>.<attrname>	Value of an attribute of the related business object of the owner business object	See the example for :%owner%.<attrname>
:%old_attrname%	The initial value from the database of the attribute	For example, if you change the value of a field from 1 to 2 to 3 to 4, the original value is 1.

## Conditional expressions examples

- :wostatus='APPR'
- :type='EM'
- :ownerid=:%user%
- :supervisor!=:%personid%
- :asset.assettype = 'IT' and :%personid%=:owner

- `:reportby=:&personid&`
- `:assetspec.classstructureid = 122`
- `:po.poline.receivedqty=0`
- `:&owner&.jobplan.priority>:&owner&.priority`
- `:owner&.po.$old_description like '%Turbin%'`

---

## Sample conditional class files

Sample condition class files are stored in a folder under the root directory of the product installation. You can use the sample files when you create class-type conditions.

To use a sample condition class, enter the file name in the Class field in the Conditional Expression Manager application.

---

## Sample condition classes

- Evaluates to true: `psdi.common.condition.AlwaysTrue`
- Evaluates to false: `psdi.common.condition.AlwaysFalse`

---

## Classifications

Classifications identify and characterize similar objects. A building, a notebook computer, and a centrifugal pump are types of classifications. A classification can also describe an event, such as a broken window or a hard disk failure.

You use the Classifications application to create classifications and to establish classification hierarchies. You also use classifications to simplify the task of managing and of retrieving historical data from other applications.

You can use classifications to align with external standards, such as vendor standards and industry standards. You can also use classifications to define the escalation path for incidents.

---

## CI Types

You use the CI Types application to specify which configuration item (CI) types to use when you import actual configuration items from a discovery tool.

Configuration item types indicate a class of actual configuration items, such as a computer system or operating system. A type is a form of classification that is displayed in the CI Types application.

You import the configuration item types using a discovery tool and an integration tool. In the second stage of the import process, you import the actual configuration items that are associated with only a subset of configuration item types. You complete this stage in the CI Types application, and select the configuration item types that you want to import and change their status to active.

The following points apply to configuration types:

- In the CI Types application, you cannot change a configuration type classification; however, you can view the classification structure in the Classification application.
- You cannot create, change, or delete configuration item types. To specify which configuration item types to use, you change their status to active.

When you delete configuration item types, the associated classifications are not affected. You also change the status of a configuration item type to inactive.

- [Configuration items management](#)  
You can search for and import configuration item types into the asset management database as a way to filter data. You can view attributes, relationships, relationship rules, and classifications for configuration item types. You can also view configuration type instances for the configuration item types you import.

---

## Configuration items management

You can search for and import configuration item types into the asset management database as a way to filter data. You can view attributes, relationships, relationship rules, and classifications for configuration item types. You can also view configuration type instances for the configuration item types you import.

---

## Configuration item discovery

You use the discovery tool to find configuration items that exist in your information technology infrastructure.

You can use the settings in the discovery tool to specify the types of configuration items to search for. Some examples of configuration items include: computers, systems, routers, and switches. The discovered configuration items reside in the discovery tool database, including configuration item types.

---

## Configuration item data import

You use Integration Composer and the IBM® Tivoli® Integration Adapter to import data from the discovery engine. You can import the data in two stages:

#### Stage 1

You import configuration item types as classifications, including their attributes and relationships, and the relationship rules between various configuration item types. You can view the classifications and attributes in the Classifications application. You can view relationships and relationship rules in the Relationships application. You can also view the list of configuration item types in the Configuration Item Types application.

You can manage only a subset of the configuration items that the discovery tool finds. In the Configuration Item Types application, you can select the configuration item types that you want to manage under configuration management and change control. The import process in stage 2 imports only the configuration item types that you select.

#### Stage 2

You import configuration item instances into the Actual Configuration Items application. The import brings only the configuration items that are associated with the configuration item types that you selected in the Configuration Item Types application. Selecting configuration item types is a way to filter the data. The import process also brings the relationships that exist between the various configuration items.

## Authorized configuration item creation

---

Configuration management and change control processes do not operate on actual configuration items. Instead, they operate as authorized configuration items which are items that conform to rules and relationships that you define in the Configuration Items application.

When you create an authorized configuration item, it can be linked to an actual configuration item record. You can also create an authorized configuration item that is independent of any actual configuration item record, because not all configuration items need to work with the discovery engine. You can create a link between the authorized configuration item and the actual configuration item in the Configuration Items and Actual Configuration Items applications.

You can create an authorized classification hierarchy that maps to an actual classification hierarchy. Partial mappings can exist between the two classifications, rather than a complete mirror image. You can use the Manage CI Hierarchies action in the Classifications application to define the configuration item hierarchies.

- [Status of configuration item types](#)  
The status of a configuration item type determines whether actual configuration items associated with that type are imported into the Actual Configuration Items application.
- [Actual configuration items](#)  
An actual configuration item is an item that is loaded into the Actual Configuration Items application from the discovery engine using the IBM Tivoli Integration Composer. You can load configuration items into the database from a discovery engine or an asset management database. First load your configuration item data into the discovery engine using the bulk loader interface.
- [Configuration item collections](#)  
In the Configuration Items application, you can associate collections with a configuration item.
- [Configuration item changes](#)  
When you create configuration items, you can change them to suit your business needs.
- [Configuration item statuses](#)  
You can change the status of configuration item records to suit your business needs.
- [Configuration item deletion](#)  
You can either delete or decommission a configuration item.

## Status of configuration item types

---

The status of a configuration item type determines whether actual configuration items associated with that type are imported into the Actual Configuration Items application.

A configuration item type can have one of the following statuses:

- New - This status applies to all configuration item types when you import them into the CI Types application. Actual configuration items that are associated with a configuration item type with a status of new are not imported. After you activate or deactivate a new configuration item type, you cannot change the status back to new.
- Active - Actual configuration items that are associated with a configuration item type with a status of active are imported.
- Inactive - Actual configuration items that are associated with a configuration item type with a status of inactive are not imported.

In the CI Types application, you use the Change Status action to change the status of a configuration item type.

## Work View

---

The Work View application queries the combined ticket and work order tables. You can display the results of the query in the Result Set portlet of your Start Center. You can view a list of all tickets and work orders that you own or that are assigned to your group. The Work View application contains one default query, called WORKVIEW.

The WORKVIEW query includes all non-historical tickets and work orders owned by the user or by your group, listed by priority. You can choose to use the default query or create your own query. The Work View application refreshes the query results in real time to reflect the status and information in the database.

An administrator assigns the Result Set portlet to Start Center templates as needed. When you create a query and mark it as public, users have access to it. Users also have access to the Result Set portlet and can use the query in their Start Center. If you have not enabled reporting or Workflow for this application, the menus do not contain any actions.

- [Working with work view queries](#)  
Work view queries contain results taken from the combined ticket and work order tables. You can edit work view queries, change the default work view query, and delete work view queries.

---

## Working with work view queries

Work view queries contain results taken from the combined ticket and work order tables. You can edit work view queries, change the default work view query, and delete work view queries.

- [Editing work view queries](#)  
You can edit the description of a query, and specify whether it is marked as a public query or whether it is a default query.
- [Changing default work view queries](#)  
You specify a query as your default query when you save the query.
- [Deleting work view queries](#)  
You can delete queries at any time. There is no restriction on deleting a query that is being used in a Result Set portlet on a Start Center. The Start Center displays a message that the portlet has not been set up. Users then select a new query for their Result Set portlet.

---

## Editing work view queries

You can edit the description of a query, and specify whether it is marked as a public query or whether it is a default query.

---

### About this task

You cannot modify the Structured Query Language (SQL) clause of a query. To use a different SQL clause, save a new query. If the original query is no longer valid, delete it.

---

### Procedure

1. Select View/Manage Queries.
2. Optional: Edit the Description field.
3. Optional: Clear or select the Default check box.
4. Optional: Clear or select the Public check box.
5. Save your edits.

---

## Changing default work view queries

You specify a query as your default query when you save the query.

---

### Procedure

1. Select View/Manage Queries.
2. In the View/Manage Queries window, clear the Default check box from another query, if needed.
3. Check the Default check box to mark a query as the default query.
4. Save your changes.

---

## Deleting work view queries

You can delete queries at any time. There is no restriction on deleting a query that is being used in a Result Set portlet on a Start Center. The Start Center displays a message that the portlet has not been set up. Users then select a new query for their Result Set portlet.

---

### Procedure

1. Select View/Manage Queries.
2. In the View/Manage Queries window, select Mark Row for Delete for each query that you want to delete.
3. Save your changes.

---

## Service Address

You can use service addresses to organize customer locations and assets by address. When you organize customer locations and assets by service address, searching for and finding them is faster.

- [Service addresses](#)  
A service address can represent the location of one or more assets or physical locations for a customer.
- [Address systems](#)  
An address system is a hierarchical system that creates relationships between addresses. You can use address systems to determine the address ancestry

throughout the hierarchy of location addresses.

- [Adding service addresses to records](#)

You add service addresses to assets, locations, work orders, and service requests so that you can search records by address.

- [Creating address systems for sites](#)

You can build a hierarchy of locations to assign service addresses to child records.

- [Configuring service addresses](#)

Service addresses provide a way to find assets and locations. Before a service address can be used, you must configure options for the way your organization uses service addresses.

---

## Service addresses

A service address can represent the location of one or more assets or physical locations for a customer.

When field crews are directed to an asset, a service address identifies the location of the asset and informs the crew how to navigate to it. The service address contains detailed location information. This information helps you to assign the correct resources when you provide service or support for an asset or a location.

When you create work for a location or an asset, the service address is copied to the service request or the work order. If the asset or location does not have an associated service address, you can use the service address of the closest ancestor in the address hierarchy.

If a work order or a service request has a service address and an asset or location is added where the address does not match, you can inherit the address from the asset or location.

When an asset is added to a work order or service request that has an address, you can use the address from the asset or location.

Service addresses provide an additional way to find assets and locations, or groups of assets and locations.

---

## Information in service addresses

Each service address has an address code. Address codes are unique to an organization, and can be available to all locations at all sites in an organization.

Service addresses can contain general or detailed location information. For example, a service address for an asset might not be exact, especially in remote areas. However, the service address is typically precise enough so that it can direct a repair crew to that location. This information is useful for crews that work in remote locations, where a point of reference might be difficult to describe.

Here are some examples of service address details:

- 300 feet behind large red outbuilding
- Mile marker 584
- X coordinate 44.4545445 and Y coordinate -78.56456456

---

## Spatial scheduling travel time

You can automatically calculate the travel time between service addresses using your map provider. In the Graphical Assignment application, from the Select Action menu, choose Populate Destination Travel Time Matrix. The values appear in the Service Addresses application. Values calculated by your map provider are regularly updated and removed from the matrix. You must repeat the process to repopulate the travel times.

You can manually enter travel time between service addresses in the Service Addresses application, using the Spatial Scheduling Travel Time option from the Select Action menu. Values that you enter manually are saved indefinitely

---

## Address systems

An address system is a hierarchical system that creates relationships between addresses. You can use address systems to determine the address ancestry throughout the hierarchy of location addresses.

In the Locations application, locations often require parent locations to illustrate a relationship between the locations. Locations with a service address can help you identify where the customer is located and help group multiple assets as child records of the location. If a parent location has a service address and belongs to an address system, the address system is used to assign service addresses to child records. You can then use the service address to identify the location of the child records on the map. This capability applies also to assets that are child records of the location.

You can assign only one system within a site as the address system, so you must decide which system determines address ancestry.

---

## Example

Breaker H344, a circuit breaker at a substation, is a location that belongs to the Bedford site. The Bedford site uses the BEDADDR system as the address system. Breaker H344 has a power pole child location. The power pole has a transformer child asset. If you use the Open Drilldown action, you can see the complete location hierarchy for breaker H344.

---

## Adding service addresses to records

You add service addresses to assets, locations, work orders, and service requests so that you can search records by address.

---

## Procedure

1. Select the record for which you want to add a service address.
2. Specify a service address.

---

## Creating address systems for sites

You can build a hierarchy of locations to assign service addresses to child records.

---

## About this task

A system cannot be an address system and a network system at the same time.

---

## Procedure

1. In the Locations application, select a location, and then select the Manage Systems action.
2. Create an address system.

---

## Configuring service addresses

Service addresses provide a way to find assets and locations. Before a service address can be used, you must configure options for the way your organization uses service addresses.

---

## Procedure

1. In the Organizations application, select your organization.
2. Select the Service Address Options action and select the options for your organization.

---

## Map Manager

You create and configure maps to provide users with a visual representation of their work.

- [Enabling maps](#)  
To enable maps, define the site, select a map provider, define a license key and any specific map provider options that are required, such as https support.
- [Developing maps and routes for applications](#)  
You can develop and extend public maps so that users can view and work with records associated with locations. You can also configure maps to show routes. You can add one or more maps to any application.
- [Configuring map tips](#)  
Map feature tips provide additional information about features that are identified on a map. By configuring map tips, you can easily access information for data visualization or call actions without leaving the map view.

---

## Enabling maps

To enable maps, define the site, select a map provider, define a license key and any specific map provider options that are required, such as https support.

---

## About this task

You add map provider details to a map so that records such as work orders can appear on the map. When a record includes an address, and longitude and latitude or x and y coordinates, that record can appear on a map.

---

## Procedure

1. In the Map Manager application, click New Map.
2. Select the map provider.  
You must obtain the appropriate license key from the map provider that you select.
3. Specify the site that the map will use.  
A site can use only one map. The user will only see the map that is assigned to the site that they are also assigned to.
4. Specify the map provider details.
5. Specify the initial map location.
6. Select the Active check box to make this map active for the sites that you specified and save the map.

## Results

The map is shown on the Map tab in the Locations, Assets, Incidents, Changes, and other applications.

## Developing maps and routes for applications

You can develop and extend public maps so that users can view and work with records associated with locations. You can also configure maps to show routes. You can add one or more maps to any application.

### Procedure

1. In the Application Designer application, select the application that you want to develop maps or routes for.
2. Click the Map tab and highlight the map section.
3. Click the Control Properties icon and enter the properties that you want to assign to the maps or routes.

## Configuring map tips

Map feature tips provide additional information about features that are identified on a map. By configuring map tips, you can easily access information for data visualization or call actions without leaving the map view.

- [Map feature tips](#)  
To provide additional information about records that are identified on a map, you can define the type of information that is displayed. This information is defined by using templates and menu items. The additional information is displayed in an information window on the map for the associated record.
- [Map feature tip templates](#)  
Map tip templates define the information that is displayed in an information window on a map. You use a rich text editor to add or modify the attributes on the template.
- [Adding additional information to map records](#)  
To provide additional information about records that are identified on a map, you can define the information in a template and add menu item actions that you can apply for the record.
- [Creating dialog boxes for map tip menu items](#)  
You can create and customize the appearance of a dialog box and use it as a menu item on the map tips window.
- [Assigning map markers to work types and work order priorities](#)  
You must assign map markers to the work types that you created and to work order priorities. Map markers make it easier for users to distinguish work orders and work types from other map features.

## Map feature tips

To provide additional information about records that are identified on a map, you can define the type of information that is displayed. This information is defined by using templates and menu items. The additional information is displayed in an information window on the map for the associated record.

A map tip object defines the template and menu items for the map tip. The templates define the content of the information window. Menu items define the actions for each map tip. Existing dialog boxes are used as menu item actions. The following table lists the existing dialog boxes that you can add as menu items to the map tip information.

Menu item label	Dialog identifier	Record
Asset Details	astdetails	Asset records
Drilldown	drilldown	Assets and location records
Service Address Related Records	maptips_sa_dialog	Service address records
View Work Details	wopms_byasset	Assets records
View Work Details	wopms_byloc	Location records

You can also add authorization access to the object and menu items. Signature options must be created for the Map Manager application in the Application Designer application. Using signature options for the object template and menu items determines user access to view the additional information for a record. Using signature options for the object and menu items is optional. If signature options are not used, then security is not validated.

## Map feature tip templates

Map tip templates define the information that is displayed in an information window on a map. You use a rich text editor to add or modify the attributes on the template.

The content of the map tip template is defined by the selected object. The template supports variable replacements that represent attributes in the record. For example, if the map tip template contains the attribute variable `${assetnum}`, then the variable is replaced by the asset number attribute in the information window.

The templates also supports one-to-one relationship attribute retrieval. For example, `${relationshipname.attributename}` shows service address information related to the current record directly as `${serviceaddress.streetaddress}`. In the information window, the service address information displays

as Address: 250 York street, London.

Message variables are represented as `#{msggroup|msgkey}`. If the template contains the message variable, then the variable is replaced by the message content related to the message group and message key. For example, `#{map|assetstatus}`.

Image variables can also be used as `!{image:optional_path}`. For example, `!{image}`. Image variables return an html image tag set with the url of the image associated with the current item record.

For example, to view the image that is associated with an item record for the asset, add `!{image}` to the template for the asset. If you want to view the image that is associated with the asset item record on the current work order, then you add `!{image:ASSET}` to the template for the work order, where ASSET is the relationship on the work order object that returns the work order asset.

---

## Adding additional information to map records

To provide additional information about records that are identified on a map, you can define the information in a template and add menu item actions that you can apply for the record.

### About this task

---

Default templates and menu items are provided during the installation process, however, you can also modify all templates and menu items.

### Procedure

---

1. In the Map Manager application, select a map record.
2. On the MapTips tab, specify the object.  
The default template and associated menu items are added.
3. Optional: To modify the content of the template, click Select fields.
4. Optional: Specify the security access for the object.
5. Specify the menu item details.
6. Save the record.

### Results

---

When a user selects a record on a map, the associated information window shows more information about that record.

---

## Creating dialog boxes for map tip menu items

You can create and customize the appearance of a dialog box and use it as a menu item on the map tips window.

### About this task

---

When you create a dialog box for map tips, the dialog box must be defined in the system library XML file.

You can use the Service Address Details dialog box as a template. The dialog identifier of the Service Address Details dialog box is *maptips\_sa\_dialog*.

### Procedure

---

1. In the Application Designer application, create the dialog box.
2. In the Map Manager application, select the MapTips tab and specify the object.
3. Specify the menu item details of the new dialog box.
4. Save the record.

---

## Assigning map markers to work types and work order priorities

You must assign map markers to the work types that you created and to work order priorities. Map markers make it easier for users to distinguish work orders and work types from other map features.

### Procedure

---

1. Open the *maximo/applications/maximo/properties/map-symbolology-config.json* file.  
This file is used to define configuration settings for map symbology, including images, colors, and labels.
2. Assign map markers to the work types that you created.
3. Assign map markers to the work order priorities.

### What to do next

---

You must shut down the Maximo® application server and rebuild the maximo.ear file by running the maximo/deployment/buildmaximoeear.cmd program. Redeploy the rebuilt maximo.ear file on your application server and restart the application server.

---

## KPI

The KPI Templates application and the KPI Manager application help you assess and monitor the performance of important activities in your organization. For example, you can create KPIs to monitor the number of work orders that are past their scheduled start date or to identify activities that might require improvement.

- [KPI Manager](#)  
In the KPI Manager application, you create key performance indicators to track critical performance variables over time. You can view key performance indicators (KPIs) in the start center or in the KPI Manager application.

---

## KPI Manager

In the KPI Manager application, you create key performance indicators to track critical performance variables over time. You can view key performance indicators (KPIs) in the start center or in the KPI Manager application.

With the appropriate authorization, you can also use the Create KPI action to create key performance indicators in other applications.

- [Historical trends and values for key performance indicators](#)  
In the KPI Manager application, you can view historical information about key performance indicators (KPIs).
- [Creating key performance indicators](#)  
You create key performance indicators to track critical performance variables over time.
- [Example: Creating KPI templates to generate KPIs](#)  
A system administrator wants to reuse common KPI queries to quickly create multiple KPIs.

---

## Historical trends and values for key performance indicators

In the KPI Manager application, you can view historical information about key performance indicators (KPIs).

The following three tabs display historical information about KPIs:

- On the Historical Trends tab, you view KPIs over period of time, compare KPIs, and view historical values.
- On the Trend tab, you view a chart of a selected KPIs over a specific period of time. The chart can display in days, weeks, months, or years. You also can compare other KPIs to the selected KPI.
- On the Historical Values tab, you view data points for individual KPIs for a specific period of time.

---

## Creating key performance indicators

You create key performance indicators to track critical performance variables over time.

---

### Procedure

1. In the Key Performance Manager application, click New KPI.
2. Provide a unique name for the key performance indicator.
3. Optional: Provide a description of the key performance indicator.
4. Specify either decimal or percentage as the calculation type.
5. Specify the selection criteria.
6. In the Query Details section, specify the KPI query.
7. To change the graph from green to yellow to red, in the KPI Parameters section, specify values in the Target field, Caution At field, and Alert At field.  
If you want a low number, specify a low value in the Target field and a high value in the Alert At field. If you want a high number, specify a high value in the Target field and a low value in the Alert At field.
8. If you want everyone to have access to the KPI, select the Public? checkbox.
9. Optional: Specify values for linking the key performance indicator.
10. Save the key performance indicator.

---

### What to do next

If you want to restrict who can see the KPI, from the Security tab, specify the security groups that have access to the KPI.

---

## Example: Creating KPI templates to generate KPIs

A system administrator wants to reuse common KPI queries to quickly create multiple KPIs.

## About this task

---

A system administrator, John, works for a large manufacturing company, which has three sites: Boston, Miami, and Detroit. Work supervisors want John to create KPIs so that they can monitor incomplete work orders in each of the sites. John can make the site a variable in the query so that he can use the same KPI template to create KPIs for each site. After he creates the KPI template, he can update it later.

## Procedure

---

1. In the KPI Templates application, create a KPI template.
2. In the Application field, select WOTRACK.
3. Specify the decimal calculation.
4. Enter the following KPI query:

```
select count(wonum) from workorder where status not in ('COMP', 'CLOSE')
and istask = 0 and targstartdate < sysdate and siteid=${mysiteid}
```

5. To define variables for the KPI query, in the KPI Variables section, click New Row.
  - a. In the Variable Name field, enter `mysiteid`.
  - b. In the Object field, select WORKORDER.
  - c. In the Attribute field, select SITEID.
6. Create the KPIs.
  - a. In the KPI section, click New Row and enter the target, caution, alert values for the KPI that you want to create for the Boston site.
  - b. In the Variable Values section, enter BOSTON as the value for the `mysiteid` variable.
  - c. In the KPI section, click New Row and enter the target, caution, alert values for the KPI that you want to create for the Miami site.
  - d. In the Variable Values section, enter MIAMI as the value for the `mysiteid` variable.
  - e. In the KPI section, click New Row and enter the target, caution, alert values for the KPI that you want to create for the Detroit site.
  - f. In the Variable Values section, enter DETROIT as the value for the `mysiteid` variable.
7. Save the KPI template and click Generate KPIs.

You can access the generated KPIs in the KPI Manager application.

---

## Record Release

In the Record Release application, you can view the records that users currently have in edit mode. You can also release records from edit mode if they are left in edit mode erroneously.

---

## Time Zone Rules

In the Time Zone Rules application, you can specify time zone rules to identify the local date and time when you create records for a process, such as generating work orders from a preventive maintenance record.

- [Creating time zone rules](#)

Records can show the local date and time of the user who is accessing the record even if the record was created in a different time zone. To display the local date and time on a record for a process, you create a time zone rule by associating the process and the process rule with the Manage business object. Time zone rules can be associated with a process at the system, organization, or site level.

---

## Creating time zone rules

Records can show the local date and time of the user who is accessing the record even if the record was created in a different time zone. To display the local date and time on a record for a process, you create a time zone rule by associating the process and the process rule with the Manage business object. Time zone rules can be associated with a process at the system, organization, or site level.

## About this task

---

When you specify a process and a process rule for an object, the time zone rule is applied to identify the local date and time. A *process* determines the action to apply to the object when identifying the correct time zone. The *process rule* determines which time zone from the main object or a related record is used to identify the local date and time.

For example, for a process that generates work orders from a preventive maintenance record, different time zones can be associated with related asset and location records to calculate the target start date of a work order. You can specify a time zone rule that uses the time zone that is associated with the asset, if one is specified and, otherwise, uses the time zone that is associated with the location. If no time zone is associated with the asset or the location, the server time zone is applied.

You can also associate a time zone with a record or with a selection of records by using the Associate Time Zone action in the Organizations, Locations, Assets, and Preventive Maintenance applications.

---

## Procedure

1. In the Time Zone Rules application, create a time zone rule.

2. Specify a process and process rule.
3. Optional: Specify an organization or a site to associate with the time zone rule.
4. Save your changes.
5. To create the records that contain the time zone that is used, select the Associate Time Zone action.

---

## Maximo Visual Inspection models

You can train accurate and efficient AI-based models in Maximo® Visual Inspection.

For more information about how you can train and work with models, see [Training and working with models](#).

---

## Analytics module

You use the applications in the Analytics module to view scheduled reports and KPIs to analyze and understand information about the lifecycle and the maintenance of your assets.

- [Viewing scheduled reports](#)  
You can view scheduled reports that might be too large to send by email.
- [Monitoring performance](#)  
You monitor KPIs to track the success of business factors that your work contributes toward. If a KPI is performing poorly, it might indicate an area of your work that requires attention.

---

## Viewing scheduled reports

You can view scheduled reports that might be too large to send by email.

After you schedule a report, you receive a link to that report to view it in the Report Viewer application.

---

## Monitoring performance

You monitor KPIs to track the success of business factors that your work contributes toward. If a KPI is performing poorly, it might indicate an area of your work that requires attention.

To quickly view KPIs outside of the Start Center, go to the KPI Viewer application. On the List tab, you can see the KPIs that track your work, in particular, the areas that most need improvement. On the KPI tab, you can see more information about KPIs, for example, you can see details about the factors that affect the KPIs. In the Historical Trends tab, you can track the performance of the KPIs over time. In the Log tab, you can enter information about KPIs and see a record of actions that are associated with the KPIs.

---

## Assets module

The Assets module contains applications that are designed to manage the assets that are owned or leased by your company from purchase to salvage, from the beginning to the end of the life cycle for an asset.

Asset records for purchased or leased information technology assets are maintained in the Assets application. You create these records in the Assets application or when you use the Receive Rotating Items action in the Receiving application. An information technology asset has a class structure identifier that belongs to the parent-level information technology classification used in your enterprise.

- [Assets](#)  
You use the Assets application to track physical assets, to define relationships between assets, and to manage assets throughout their life cycles.
- [Asset Templates](#)  
You can specify common asset information in an asset template that you can then apply to multiple assets.
- [Locations](#)  
Use the Locations application to specify and to track locations for assets. You can also organize locations into logical hierarchical systems or network systems. Using hierarchies or systems of locations and specifying the locations for assets on an asset record provides the groundwork for gathering and tracking information about the history of an asset, including its performance at specific sites, as it is moved from location to location. With locations organized into systems, you can quickly find a location on the Drilldown page, and identify the asset at that location.
- [Meters](#)  
You use the Meters application to add or to modify meter definitions. Meter definitions include names for the meters as well as sets of attributes that describe the meters. Meters are used to track asset or location performance. An asset or a location can have multiple meters associated with it.
- [Relationships](#)  
A relationship uses basic terms to describe the dependency or connectivity between configuration items. The basic terms include runs on, installed on, contained, and so forth.
- [Meter Groups](#)  
You use the Meter Groups application to define a logical grouping of meters that comprise a meter group. Meter groups represent a collection of meters that are used together numerous times.

- **Condition Monitoring**

You use the Condition Monitoring application to create and to view measurement point records for assets and for locations. A measurement point record defines the limits of acceptable meter readings for a characteristic meter or for a gauge meter on an asset or at a location.

- **Failure Codes**

You use the Failure Codes application to build and to display failure hierarchies. Hierarchies help you construct accurate histories of the failures that affect your assets and operating locations. After reporting and analyzing failure trends, you can take preventive measures. The identifier of a failure hierarchy is the failure class.

---

## Assets

You use the Assets application to track physical assets, to define relationships between assets, and to manage assets throughout their life cycles.

- **Assets overview**

You use the Assets application to create and to store asset numbers and corresponding information, such as parent, location, vendor, status, and maintenance costs for each asset. You can build the asset hierarchy as an arrangement of buildings, departments, assets, and subassemblies. The asset hierarchy provides a convenient way to roll up maintenance costs so that you can check accumulated costs at any level, at any time. You can also find a particular asset quickly.

- **Working with assets**

You can create, view, modify, and delete assets.

---

## Assets overview

You use the Assets application to create and to store asset numbers and corresponding information, such as parent, location, vendor, status, and maintenance costs for each asset. You can build the asset hierarchy as an arrangement of buildings, departments, assets, and subassemblies. The asset hierarchy provides a convenient way to roll up maintenance costs so that you can check accumulated costs at any level, at any time. You can also find a particular asset quickly.

Use the Assets application to perform the following tasks:

- Search for asset records.
- View, modify, add, or delete the main record for an asset.
- Create the asset hierarchy and view the subassemblies and parts of an asset.
- View, modify, add, or delete safety records for an asset.
- View or add metering information for an asset.
- Specify or view the specifications for an asset as recorded in the Classifications application.
- **Rotating assets and non-rotating assets**  
Assets can be either rotating or non-rotating. Rotating assets are assets that are interchangeable, such as motors, pumps, fire extinguishers, or PC monitors. Rotating assets have both a unique asset number and an inventory item number. You can use the item number to track assets as a group as assets are moved in and out of inventory and other types of locations. The asset number is useful for tracking instances of assets as they are moved from one location to another and from one site to another.
- **Asset depreciation**  
Depreciation schedules reduce the value of an asset according to user-defined period thresholds. Depreciation provide a more accurate view of an asset's current value and facilitate better decision-making regarding an asset's lifecycle.

---

## Rotating assets and non-rotating assets

Assets can be either rotating or non-rotating. Rotating assets are assets that are interchangeable, such as motors, pumps, fire extinguishers, or PC monitors. Rotating assets have both a unique asset number and an inventory item number. You can use the item number to track assets as a group as assets are moved in and out of inventory and other types of locations. The asset number is useful for tracking instances of assets as they are moved from one location to another and from one site to another.

Before you can create a record for a rotating asset in the Assets application, the rotating item record must first be created in the Item Master application.

Non-rotating assets do not move in and out of storerooms. A non-rotating asset has a unique asset number, but does not have an item number because it is not tracked in inventory.

---

## Example of a rotating asset

A company might have four identical (same make, same model) centrifugal pumps, so all four pumps would have the same item number. To track the use, the repairs, and the locations of each individual pump, each pump has its own, unique asset number.

---

## Asset depreciation

Depreciation schedules reduce the value of an asset according to user-defined period thresholds. Depreciation provide a more accurate view of an asset's current value and facilitate better decision-making regarding an asset's lifecycle.

Asset depreciation contributes to an asset's lifecycle story. When you apply a depreciation schedule to an asset, a depreciation expense is periodically allocated to the cost of an asset's original purchase value. The schedule can be straight line or double declining. In a straight-line schedule, the expense is an equal amount each period. In a double declining schedule, the expense is a percentage of the item's cost. The rate at which this expense is applied is determined by a user-defined period threshold. Period thresholds can be either date-based or usage-based. Date-based periods can be calculated monthly, quarterly, semi-yearly, or yearly. Usage-based periods are calculated based on meter life-to-date intervals.

A depreciation schedule can be added to an asset by using an action in the Assets application or by applying an asset template that contains a depreciation schedule. Depreciation schedules can also be inherited from rotating items during the receiving or invoicing process. After an asset has a depreciation schedule, you can adjust or remove the schedule in the Manage Depreciation Schedule dialog box, or you can swap the depreciation schedule with another asset in the Swap Depreciation Schedule dialog box.

---

## Working with assets

You can create, view, modify, and delete assets.

- **[Creating assets](#)**  
You use the Assets application to create and to store asset numbers and corresponding information, such as parent, location, vendor, up/down status, and maintenance costs for each asset.
- **[Adding assets to collections](#)**  
You use the Assets application to add one or more selected assets to one or more active collections. A collection is a group that can contain assets, locations, and classification items. An asset can be added to more than one collection.
- **[Adding relationships to assets](#)**  
You specify relationships between assets and locations to define a logical connection between separate assets. For example, you can define an intersection between a road and a railway line or a connection between a network cable and a computer.
- **[Viewing related assets](#)**  
All asset relationships have a source asset and a target asset. You can view all relationships for an asset or you can filter the view to see a subset of its relationships.
- **[Issuing items from a storeroom](#)**  
You use the Assets application to issue items to an asset. You also can use this application to return items from an asset to a storeroom. You can issue both rotating and non-rotating items, and you can issue items from different storerooms.
- **[Modifying assets](#)**  
After you create an asset, you can add it to a collection, change its status, add downtime information, add meter information, move the asset, swap the asset, change the item number, or zero the year-to-date amount.
- **[Importing asset-related digital data](#)**  
You can import asset-related digital data into Maximo® Manage from IBM® Digital Twin Exchange. After you configure integration components, you use the Assets application to connect to Digital Twin Exchange and import the data.

---

## Creating assets

You use the Assets application to create and to store asset numbers and corresponding information, such as parent, location, vendor, up/down status, and maintenance costs for each asset.

---

### Procedure

1. On the toolbar of the Assets application, click the New Asset icon.
  2. In the Asset Description field, type a description.
  3. In the Rotating Item field, if the asset is rotating, type a value.
  4. If this asset has a parent, type a value in the Parent field. If the parent asset is associated with a location, the location identifier is copied to the Location field. Only assets that are in non-inventory locations can be assigned as parents. You cannot build a hierarchy when assets are in a storeroom.
  5. Optional: Type information in the other fields as needed.
  6. Click Save Asset.
- **[Applying item assembly structures](#)**  
You use the Assets application to apply an item assembly structure to a rotating asset or to an operating location.
  - **[Associating users and custodians with assets](#)**  
You can associate a person with an asset as a custodian, as a user, or as both. A user is someone who uses the asset. A custodian is someone responsible for the care of the asset. An asset can have multiple users and multiple custodians. If an asset has no users or custodians, anyone can create an incident or service request for the asset.
  - **[Associating services with assets](#)**  
You can associate one or more services with an asset. Examples of services are e-mail support, telecommunications, customer support, and PC support. If a service changes, you can identify affected assets.
  - **[Associating safety information with assets](#)**  
You can associate safety information, such as tag-out procedures, hazards, and hazardous materials lists with an asset.

---

## Applying item assembly structures

You use the Assets application to apply an item assembly structure to a rotating asset or to an operating location.

## About this task

When you apply an item assembly structure with rotating and non-rotating items to an asset record, the non-rotating items are shown on the Spare Parts tab of the asset record. If a rotating item in an item assembly structure has child items, the child items are applied to the selected asset or to the location record. As a result, the child items do not have their own inventory balance.

## Procedure

1. From the Assets application, display the asset to which you want to apply an item assembly structure.
2. Select the Apply Item Assembly Structure action.
3. You can either assign unique numbers to the rotating items or have the product assign numbers.

Option	Description
<b>If you want to assign unique numbers to each rotating item</b>	<ol style="list-style-type: none"><li>a. In the Asset field, specify a value.</li><li>b. In the Item field, click Detail Menu and select Move To.</li><li>c. Repeat step a and b to assign numbers to all the items in the hierarchy.</li></ol>
<b>If you want the product to assign numbers to all the rotating items in the hierarchy</b>	Click Autonumber All. All the items in the first level of the hierarchy are assigned a number. If there are any child items in the item assembly structure hierarchy, they are also numbered.

4. Click OK, then click Save Asset.

## Associating users and custodians with assets

You can associate a person with an asset as a custodian, as a user, or as both. A user is someone who uses the asset. A custodian is someone responsible for the care of the asset. An asset can have multiple users and multiple custodians. If an asset has no users or custodians, anyone can create an incident or service request for the asset.

## About this task

If you use the Desktop Requisitions application or the Service Requests application, you can create a request with that asset only if you are an associated user or a custodian for that asset. In other applications, when a caller contacts a service desk agent, the agent can associate the caller with the ticket and then associate the appropriate assets with the ticket.

By default, the first person that you associate with an asset is the primary contact for that asset. You can change the primary contact. You can designate one or more people as users, and one or more people as custodians.

## Procedure

1. From the Assets application, display the asset for which you want to associate users and/or custodians.
2. Select the Associate Users and Custodians action. For each person listed, data displays indicating whether a person is a user, a custodian, or both. If a person is the primary contact for the asset, the Primary check box is selected.
3. Click New Row.
4. In the Person field, type the identifier of the person you want to associate with the asset.
5. To designate the relationship that a person has with an asset, perform either or both of the following actions:
  - a. To designate the person as a user, select the User check box.
  - b. To designate the person as a custodian, select the Custodian check box.
6. To designate a person as the primary contact, select the Primary check box. When you select the Primary check box, the Primary check box clears for the person previously designated as the primary contact.
7. Click OK.

## Associating services with assets

You can associate one or more services with an asset. Examples of services are e-mail support, telecommunications, customer support, and PC support. If a service changes, you can identify affected assets.

## Procedure

1. From the Assets application, display the asset with which you want to associate a service or service group.
2. Select the Associate Services action.
3. In the Associate Services window, click New Row.
4. In the Service Group field, type a value.
5. To select a service within the service group, specify a value in the Service field. If you do not select a service group and you select a service that is associated with a service group, the service group displays in the Service Group field.
6. Click OK.

## Associating safety information with assets

You can associate safety information, such as tag-out procedures, hazards, and hazardous materials lists with an asset.

- **[Associating tag out procedures with assets](#)**  
You use the Assets application to associate tag out procedures with assets. A tag out procedure is a detailed description of how to take work assets out of service or how to place them back into service, to ensure a safe working environment.
- **[Associating hazards with assets](#)**  
You use the Assets application to add hazards to asset and to location records. When you build safety plans using the Safety Plans application and use those safety plans on work orders, the hazards associated with specific assets and locations are included on the work order.
- **[Associating hazardous materials with assets](#)**  
You use the Assets application to add hazardous materials to asset records and to location records. When you build safety plans in the Safety Plan application and then use those safety plans in work orders, the hazardous materials associated with specific assets and locations are included on the work order.
- **[Associating safety-related issues with assets](#)**  
You use the Assets application to associate issues of safety that workers need to be aware of when they perform work on a selected asset.

---

## Associating tag out procedures with assets

You use the Assets application to associate tag out procedures with assets. A tag out procedure is a detailed description of how to take work assets out of service or how to place them back into service, to ensure a safe working environment.

---

### Before you begin

Before you can associate a tag out procedure with an asset, the tag out procedures must be associated with a hazard using the Safety Hazards application.

---

### Procedure

1. From the Assets application, display the asset record with which you want to associate a tag out procedure.
2. On the Safety tab, click the Lock Out/Tag Out sub tab.
3. Under the Hazards table window, click New Row.
4. In the Hazard field, specify a value.
5. In the Hazards table window, select the hazard for which you want to add a tag out procedure.
6. Under the Tag Out Procedures table window, click New Row.
7. In the Tag Out field, specify a value.
8. Click Save Asset. The lock out steps for the selected tag out display in the Lock Out Operations table window in read-only format. Use the Lock Out/Tag Out application to create the specific lock out steps that display in this table.

---

## Associating hazards with assets

You use the Assets application to add hazards to asset and to location records. When you build safety plans using the Safety Plans application and use those safety plans on work orders, the hazards associated with specific assets and locations are included on the work order.

---

### Before you begin

Before you can add a hazard to an asset record, the hazard must have been defined using the Safety Hazards application.

---

### Procedure

1. On the Safety tab of the Assets application, click the Hazards and Precautions sub tab.
2. Under the Hazards table window, click New Row.
3. In the Hazard field, specify a hazard. Only precaution-enabled hazards display in the Select Value window. If the hazard you select has precautions associated with it, the precautions display in the Precautions table window. If the hazard is hazardous-material enabled, the hazard displays, along with its hazardous material information, on the Hazardous Materials sub tab of the Safety tab. The Precautions table is display-only.
4. Click Save Asset.

---

## Associating hazardous materials with assets

You use the Assets application to add hazardous materials to asset records and to location records. When you build safety plans in the Safety Plan application and then use those safety plans in work orders, the hazardous materials associated with specific assets and locations are included on the work order.

---

### Procedure

1. From the Assets application, display the asset record with which you want to associate hazardous material.
2. On the Safety tab, click the Hazardous Materials sub tab.
3. Under the Hazardous Materials table window, click New Row.

4. In the Hazard field, type a value. If the hazard you select has precautions associated with it, the precautions display in the Precautions table window. The Precautions table window is read-only.
5. Click Save Asset.

---

## Associating safety-related issues with assets

You use the Assets application to associate issues of safety that workers need to be aware of when they perform work on a selected asset.

### About this task

---

If the asset record has hazards or has tag outs associated with it, be sure to associate the record with itself. Doing so makes the safety-related information available when creating a safety plan or a job plan for that asset.

### Procedure

---

1. From the Assets application, display the asset record with which you want to associate a safety-related asset.
2. On the Safety tab, click the Safety-Related Assets sub tab.
3. Under the Safety-Related Assets table window, click New Row.
4. In the Asset field or in the Location field, type a value.
5. Repeat steps 3 - 4 for each asset that you want to associate with the current record. If the current asset record has hazards or tag outs associated with it, be sure to add its asset identifier to the Safety-Related Assets table window.
6. Click Save Asset.

---

## Adding assets to collections

You use the Assets application to add one or more selected assets to one or more active collections. A collection is a group that can contain assets, locations, and classification items. An asset can be added to more than one collection.

### Procedure

---

1. On the List tab of the Assets application, filter the list to display the assets that you want to add to a collection.
2. Click the Select Records check box, and select the check box for each asset that you want to add to a collection. To select all the assets, check the Select All Records box in the header row of the Assets window.
3. Select the Add Assets to Collections action.
4. In the Collection field of the Add Assets to Collections window, click Detail Menu to select an option and to retrieve a value.
5. Click OK.

---

## Adding relationships to assets

You specify relationships between assets and locations to define a logical connection between separate assets. For example, you can define an intersection between a road and a railway line or a connection between a network cable and a computer.

### Before you begin

---

Before you can add a relationship to an asset, you must first create the relationship definition in the Relationships application.

### Procedure

---

1. Select an asset and click the Relationships tab.
2. In the Relationships table, click New Row.
3. Optional: If you want to sort relationships sequentially, enter a sequence number for the relationship. Otherwise, relationships are shown in the order of entry.
4. Specify a Relationship or use the Detail menu to select a value.
5. In the Target Asset field, specify the asset that is the target in the relationship. If the Source Asset is not the currently selected asset, specify the current asset in the Target Asset field.
6. Click New Row to add further relationships or Save.

### What to do next

---

When you have entered the Source Asset, Relationship and Target Asset, the relationship is validated against any rules created in the Relationship application. If the relationship is not valid, an error message is shown. However, if the relationship definition has the Allow Over-Ride option selected, a message is shown, asking if the relationship should be applied regardless. You can override the validation warning by clicking OK.

- [Granting access to asset relationship functions](#)  
Signature options, which are defined in the Security Groups application, are used to control access to functions in applications. By using signature options,

you can grant access to specific groups of users. In the Assets application, the ability to create asset relationships and view relationship history is controlled by signature options.

---

## Granting access to asset relationship functions

Signature options, which are defined in the Security Groups application, are used to control access to functions in applications. By using signature options, you can grant access to specific groups of users. In the Assets application, the ability to create asset relationships and view relationship history is controlled by signature options.

---

### Procedure

1. In the List tab of the Security Groups application, select the group to be granted access to the relationship functions. For example, the MAXEVERYONE group is for all Maximo® users.
2. Under the Applications tab, in the Description column, click Assets.
3. Scroll down to the third panel, listing Assets application functions, then navigate to the Relationships Tab line. To allow access to this function, click the Grant Access check box for each function name and Save
4. Navigate to the View Asset Relationship History line. To allow access to this function, click the Grant Access check box for each function name and Save
5. Navigate to the Topology Viewer Presentation line. To allow access to this function, click the Grant Access check box for each function name and Save

---

## Viewing related assets

All asset relationships have a source asset and a target asset. You can view all relationships for an asset or you can filter the view to see a subset of its relationships.

---

### Procedure

1. Select an asset and click the Relationships tab.
2. In the Filter By menu, select one of the options. Click the refresh icon to show the set of relationships you chose.
3. To sort the relationships list by any of the columns, select the sort arrow icon next to the field title. The default is the sequence number column.
4. Click the detail menu next to a source or target asset to move to or view related asset information.  
You can also use other functions in this menu to view historical asset information.
5. To retrace your steps through a series of source or target asset Move to navigational commands, click the View History toolbar icon and select an asset from the list.

---

## Issuing items from a storeroom

You use the Assets application to issue items to an asset. You also can use this application to return items from an asset to a storeroom. You can issue both rotating and non-rotating items, and you can issue items from different storerooms.

---

### Procedure

1. From the List tab in the Assets application, select the asset to which you want to issue items.
2. Select the Issue Items from Storeroom action.
3. In the Issue Items from Storeroom window, specify a default storeroom and/or a storeroom site from which to issue items.
4. In the Associated Items table window, click New Row.
5. In the Item field, specify the item you want to issue.
6. In the Storeroom field, specify a storeroom.
7. In the Quantity field, type the number of items that you want to issue.
8. In the Transaction Type field, select ISSUE if you are issuing the item to the asset, or RETURN, if you are returning the item to a storeroom.
9. Specify other values as needed:
  - a. Depending on the item, you might be able to specify a bin, a lot, a work order, and other values.
  - b. If you use general ledger accounts, specify them fully.
10. Click New Row to add another item to be issued to the same asset.
11. Click OK.

---

### Example

For example, if you are configuring a laptop computer in the Assets application, you might need to issue software to it. Rather than opening the Inventory application to issue the software, you can use the Assets application to issue the software.

---

## Modifying assets

After you create an asset, you can add it to a collection, change its status, add downtime information, add meter information, move the asset, swap the asset, change the item number, or zero the year-to-date amount.

- [Changing the status of assets](#)  
You use the Assets application to change the status of an asset. Assets have a designated status that indicates whether they are operational. When you create an asset record, the default status is Not Ready.
- [Adding depreciation schedules to assets](#)  
You add depreciation schedules to assets to reduce the value of that asset according to user-defined period thresholds. In date-based schedules, the value depreciates at specific time intervals. In usage-based schedules, the value declines based on an asset meter. For example, you can set a depreciation schedule on a vehicle that is based on miles driven or time in service.
- [Swapping depreciation schedules between assets](#)  
If you need to replace an asset that has a depreciation schedule, you can swap depreciation schedules between the original asset and the replacement asset.
- [Reporting asset downtimes](#)  
You use the Assets application to report the start and end time of the downtime for an asset after it has occurred.
- [Adding meters to assets](#)  
Use the Assets application to associate multiple meters with an asset. If the selected asset is associated with a meter group, the meters in that group display in the Meters window on the Meters tab.
- [Moving assets](#)  
You can move an asset from a non-inventory location to another non-inventory location or to a storeroom. You can move assets from your current site to another site within your organization, or to a site in a different organization.
- [Swapping assets](#)  
You use the Assets application to replace one asset with another asset, and to specify a location for the asset you swap out. You can swap any number of assets at once. You cannot move rotating assets from inventory locations. Use the Inventory application to issue rotating assets or to transfer rotating assets.
- [Changing item numbers](#)  
You can change the item number of the current rotating asset record.
- [Zeroing out asset costs](#)  
You use the Assets application to zero out the year to date or the total costs for an asset. This action might be performed once per year.
- [Rolling up maintenance costs](#)  
In the Assets application, you can calculate the maintenance cost of your assets by rolling up costs that you incur for labor, materials, tools, and services.

---

## Changing the status of assets

You use the Assets application to change the status of an asset. Assets have a designated status that indicates whether they are operational. When you create an asset record, the default status is Not Ready.

---

### About this task

When you change the status of an asset, you can select an option to apply the new status to all child assets.

If a rotating asset has a status of Decommissioned, you cannot change the status for this asset. The Decommissioned status indicates that the rotating asset has been returned to the vendor. The asset record becomes a history record that cannot be changed.

---

### Procedure

1. From the Assets application, display the asset whose status you want to change.
2. Select the Change Status action.
3. In the New Status field, select a status from the drop-down list.
4. Click OK.

---

## Adding depreciation schedules to assets

You add depreciation schedules to assets to reduce the value of that asset according to user-defined period thresholds. In date-based schedules, the value depreciates at specific time intervals. In usage-based schedules, the value declines based on an asset meter. For example, you can set a depreciation schedule on a vehicle that is based on miles driven or time in service.

---

### Before you begin

An asset must have values for a starting cost and a salvage amount before you can set a depreciation schedule. You can define both of these values when you create the depreciation schedule.

---

### Procedure

1. Select an asset and click the Depreciation Schedule > Manage Depreciation Schedule action.
2. In the Schedule Definition table, click New Row and specify either a straight-line calculation or a double-declining calculation in the Method field.
3. In the Period Type field, specify either a date or meter schedule.
4. In the Periods field, specify the number of depreciation periods that are in the schedule.
5. Depending on the period type you specified, specify either the date period information or meter period information.
6. Click OK to save the schedule.

---

## Swapping depreciation schedules between assets

If you need to replace an asset that has a depreciation schedule, you can swap depreciation schedules between the original asset and the replacement asset.

### Procedure

---

1. Select the asset that needs to be replaced and click the Depreciation Schedule > Swap Depreciation Schedule action.
2. In the Target Asset table, specify the replacement asset.
3. Click OK to complete the swap.

---

## Reporting asset downtimes

You use the Assets application to report the start and end time of the downtime for an asset after it has occurred.

### About this task

---

An asset might incur both operational and non-operational downtime. You can create multiple downtime reports on a single work order.

### Procedure

---

1. From the Assets application, display the record for the asset for which you want to report downtime.
2. Select the Report Downtime action.
3. In the Start Date field, the system date is displayed. Edit the date if necessary.
4. In the End Date field, specify a date the downtime ended or will end. The Hours field shows the total downtime hours based upon the start date and the end date. This calculation considers the calendar for the asset and the elapsed time between the start and end of downtime.
5. In the Downtime Code field, specify a code to describe the downtime.
6. In the Downtime Type section, select either of the following fields:
  - a. Operational If the downtime occurred when the asset was in use.
  - b. Non-Operational If the downtime occurred when the asset was not in use.
7. Click OK.

- [Changing downtime asset status](#)

You use the Assets application to change the status of an asset from downtime to uptime or from uptime to downtime.

- [Managing downtime history](#)

You use the Assets application to view and to modify information about the downtime that has been reported against an asset. For example, if a downtime period extends beyond the planned end date that was recorded, you can change the end date.

---

## Changing downtime asset status

You use the Assets application to change the status of an asset from downtime to uptime or from uptime to downtime.

### Procedure

---

1. From the Assets application, display the record for the asset for which you want to change the status.
2. Select the Report Downtime action.
3. Select the Change Status action.
4. Optional: Edit the date in the Status Date field, if the date of the status change is not the system date.
5. In the Downtime Code field, click Select Value and specify a reason for the status change.
6. In the Downtime Type section, select either of the following options:
  - a. Operational If the status change occurs when the asset is in use.
  - b. Non-Operational If the status change occurs when the asset is not in use.
7. Click OK.

### Related tasks

---

## Managing downtime history

You use the Assets application to view and to modify information about the downtime that has been reported against an asset. For example, if a downtime period extends beyond the planned end date that was recorded, you can change the end date.

## Procedure

---

1. From the Assets application, display the asset record for which you want to manage downtime history.
2. Select the Manage Downtime History action.
3. In the Details window, select the row for the downtime whose details you want to view, and modify information as needed.
4. Click OK and click Save Asset.

## Related tasks

---

---

## Adding meters to assets

Use the Assets application to associate multiple meters with an asset. If the selected asset is associated with a meter group, the meters in that group display in the Meters window on the Meters tab.

## Procedure

---

1. In the Assets application, display the asset to which you want to add a meter.
2. On the Meters tab, click New Row. If a value appears in the Meter Group field and there are meters in that meter group, those meters display in the Meters window.
3. In the Meter field, specify a meter.
4. If you select a continuous type of meter, specify one of the following options for the Average Calculation Method:
  - a. All To use all the readings to calculate the average of the readings.
  - b. Sliding Days To use a specific number of days to calculate the average of the readings. If you specify Sliding, type a value in the Sliding Window Size field for the number of days to use in the calculation.
  - c. Sliding Readings To use a specific number of readings to calculate the average of the readings. If you specify Sliding, type a value in the Sliding Window Size field for the number of readings to use in the calculation.
  - d. Static To set the average reading and never recalculate it. If you specify Static, type a value in the Average Units/Day field.
5. For a continuous type of meter, in the Reading Type field, specify Delta (to report incremental use) or Actual (to report cumulative use).
6. For a continuous type of meter, in the Accept Rolldown From field, specify Asset (for the readings of the parent asset to apply to the current asset), Location (for the readings of the location to apply to the current asset), or None.
7. If the asset is a linear asset, such as a roadway or a pipeline, specify values in the Linear Segment Details section as needed.  
The Linear feature is available through a separately licensed product extension.
8. Click Save Asset.

- [Specifying meter readings](#)

You use the Assets application to report meter readings for a selected asset.

- [Assigning meter groups to assets](#)

You use the Assets application to assign a meter group to an asset.

- [Updating meter history](#)

Use the Manage Meter Reading History action in the Assets application to view or to update historical meter readings.

- [Resetting meter readings](#)

You use the Assets application to clear the readings for a continuous type of meter.

- [Deleting asset records](#)

You use the Assets application to delete asset records from the database.

- [Updating historical meter readings](#)

Use the Assets application to update the history of a meter or to insert a historical reading.

- [Replacing meters](#)

You use the Assets application to replace meter. Use the replace feature when a physical meter breaks and you want to replace it. The replace feature lets you record a starting value for the replacement meter. The starting value of the replacement meter might not be zero if it has been previously used.

---

## Specifying meter readings

You use the Assets application to report meter readings for a selected asset.

## Before you begin

---

You might need to acquire the proper authorization to specify historical readings.

## About this task

---

A historical reading has a New Reading Date that is before the last reading date.

## Procedure

---

1. On the Meters tab of the Assets application, display the asset for which you want to type meter readings.

2. Select the Enter Meter Readings action.
3. In the New Reading field for the meter, specify a value. The Average Units/Day field value is calculated.
4. If you are entering a delta reading, select the Delta check box. If the meter was set up as a delta reading type, the check box is selected by default. If you are specifying an actual reading that is a rollover reading, select the Rollover check box. In a rollover reading, the new reading value is less than the Previous Reading value due to a rollover.
5. To view the details for the meter, click View Details.
6. Optional: Edit the date and time in the New Reading Date field.
7. Optional: Type a comment about the reading in the Remarks field.
8. Click OK to save the specified readings and close the dialog box.

# Assigning meter groups to assets

You use the Assets application to assign a meter group to an asset.

---

## About this task

If the asset is a rotating asset, and its rotating item has a meter group assigned to it, the meter group associated with the item is copied to the asset record and the Meter Group field is read-only. If the item for a rotating asset does not have a meter group assigned to it, you can assign a meter group to the asset. You can also assign a meter group to a non-rotating asset. When an asset has a meter group associated with it, all the meters that belong to that group display in the Meters tab. You can add and delete meters from the list.

---

## Procedure

1. From the Assets application, display the asset to which you want to assign a meter group.
2. In the Meter Group field on the Meters tab, specify a value.

---

# Updating meter history

Use the Manage Meter Reading History action in the Assets application to view or to update historical meter readings.

---

## Before you begin

Depending on your security authorization, you might be able to only view historical readings and not to update them.

---

## About this task

When you update a meter reading, the delta (change) readings are applied to all the readings for that meter that are more recent than the date on which you make the update. If the meter is on an asset in a hierarchy, the readings for the assets in the hierarchy are also updated. If the meter is for a location that has assets set up to accept the roll down from their locations, the meters for those assets are updated.

---

## Procedure

1. From the List tab of the Assets application, open the asset record for which you want to update the meter history.
2. Select the Manage Meter Reading History action.
3. In the Manage Meter History window, click the Continuous Meter Readings tab or the Characteristic and Gauge Meter Readings tab to view and update meters based on their meter types.
4. On the Continuous Meter Readings tab, you can enter the modified reading when the Enter as Delta check box is not selected. Select the Enter as Delta check box to specify a delta for the selected meter.
5. Specify the updated meter readings and click OK.

## Resetting meter readings

You use the Assets application to clear the readings for a continuous type of meter.

## Procedure

---

1. From the Assets application, display the asset record for the meter that you want to reset.
2. Select the Reset/Replace Meters action.
3. Click View Details to view information for the selected meter.
4. Specify values as needed in the Since Last Repair field, the Since Last Overhaul field, the Since Last Inspection field, the Since Install field, the Rollover field, and the Average field.
5. Click OK.

## Deleting asset records

You use the Assets application to delete asset records from the database.

## About this task

---

If the asset you want to delete is referenced on an active job plan, a location, a preventive maintenance, a purchase order, a route, a safety plan, or a work order, you cannot delete the asset record.

## Procedure

---

1. On the List tab of the Assets application, select the asset you want to delete.
2. Select the Delete Asset action, and click Yes.

---

## Updating historical meter readings

Use the Assets application to update the history of a meter or to insert a historical reading.

The following rules apply to updating historical meter readings:

- If you specify a modified reading for an asset or for a location, the change is applied to all delta (change) readings that are more recent than the date of the modified reading for that meter. Subsequent meter readings are updated until the first actual reading is reached.
- Only readings of meters and of assets (those assets that were set up to inherit meter readings from parents) that were members of the hierarchy at the time of the original meter reading are updated. Meters and assets added to the hierarchy after the original meter reading remain unchanged.
- When a reading is modified, the modified date, the user, and a reason for the change is recorded.
- A historical reading can be greater than a subsequent reading only if the meter has a rollover point.

---

## Moving assets

You can move an asset from a non-inventory location to another non-inventory location or to a storeroom. You can move assets from your current site to another site within your organization, or to a site in a different organization.

---

### About this task

When you move multiple assets, you might want to specify the same information for most or all of the assets. For example, you might want to specify the same location, or remove the parent for all assets that you are moving.

---

### Procedure

1. From the List tab, display the asset that you want to move.
2. Select the Move/Modify Assets action.
3. In the Move/Modify Assets window, click the Assets tab.
4. To add assets, click Select More Assets.
5. To move the assets, perform any of the following actions in the Mass Move section:

Option	Description
To move the assets to a different site	<ol style="list-style-type: none"> <li>a. Specify a value in the To Site field, or click Detail Menu to retrieve a value. The site can be in the organization in which you logged in or a different organization.</li> <li>b. Next to the To Site field, click Apply. If the site to which you want to move the assets has an asset with the same identifier as one that you are moving, you must assign a different identifier for the asset you are moving. Every asset within a site must have a unique identifier.</li> </ol>
To move the assets to a different location	<ol style="list-style-type: none"> <li>a. Type a value in the To Location field, or click Detail Menu to retrieve a value.</li> <li>b. Next to the To Location field, click Apply.</li> </ol>
To move the assets to a different parent	<ol style="list-style-type: none"> <li>a. Type a value in the To Parent field, or click Detail Menu to retrieve a value.</li> <li>b. Next to the To Parent field, click Apply.</li> </ol>
To move all the assets to one parent	<ol style="list-style-type: none"> <li>a. Type a value in the To Parent field.</li> <li>b. Click Apply.</li> <li>c. Perform one of the following actions: <ul style="list-style-type: none"> <li>• To perform the move immediately, click Execute Now.</li> <li>• To perform the move when the work order's status is COMP (Complete), click Save as Plan.</li> </ul> </li> </ol>
To move the assets to a different bin	<ol style="list-style-type: none"> <li>a. Specify a value in the To Bin field, or click Detail Menu to retrieve a value.</li> <li>b. Next to the To Bin field, click Apply.</li> </ol>

6. Optional: You can edit any fields for individual assets.
7. Click OK, then click Save.

## Swapping assets

You use the Assets application to replace one asset with another asset, and to specify a location for the asset you swap out. You can swap any number of assets at once. You cannot move rotating assets from inventory locations. Use the Inventory application to issue rotating assets or to transfer rotating assets.

### Before you begin

The ability to swap assets to and from another site or another organization depends upon your security authorization.

### About this task

The following rules apply to swapping assets:

- You can swap rotating assets from one organization to another only if both organizations use the same item set.
- Every asset within a site must have a unique identifier. If the replacing asset from another site or organization has the same asset identifier as an asset in your current site, you are prompted to assign a new asset identifier for the replacing asset.

### Procedure

1. From the List tab of the Assets application, or from the asset record you want to swap, click Swap Assets.
2. In the Swap Assets window for the asset that you want to swap out, perform either of the following actions:
  - a. In the To Location field, click Detail Menu to assign the asset to a location within the current site.
  - b. To assign the asset to another site, click the View Details icon. In the To Site field, click Select Value. Optional: Select values for the To Location field, the To Parent field, or the Bin field.
3. To select a replacement, perform either of the following actions:
  - a. To choose a replacing asset from within the current site, in the Replacing Asset field, click Detail Menu.
  - b. To choose a replacing asset from another site, click View Details, then in the From Site field, click Select Value. In the Replacing Asset field, click Detail Menu.
4. If you accessed the Swap Assets window from an asset record and want to swap additional assets, click Select More Assets to add assets to the list. Repeat steps 2 and 3 for each asset you added.
5. Click OK.

## Changing item numbers

You can change the item number of the current rotating asset record.

### About this task

Changing item numbers is useful because some industries require different part numbers for the same type of part, depending on what the part is used for. A different part number can indicate that the same part has different installation requirements when it is used for different things.

## Procedure

---

1. On the Asset tab of the Assets application, display the asset record whose item number you want to change.
2. Select the Change Item Number action.
3. In the New Item field, type a value, and click OK.

---

## Zeroing out asset costs

You use the Assets application to zero out the year to date or the total costs for an asset. This action might be performed once per year.

## Procedure

---

1. From the Assets application, display the record whose costs you want to reset.
2. From the Select Action menu, select Zero Asset Costs.
3. In the Zero Asset Costs window, select either of the following options:
  - a. Select the Zero Year to Date Costs check box, to zero all costs to date within the current year.
  - b. Select the Zero Total Costs check box, to zero all costs for the asset.
4. Click OK.

---

## Rolling up maintenance costs

In the Assets application, you can calculate the maintenance cost of your assets by rolling up costs that you incur for labor, materials, tools, and services.

## About this task

---

If a work order is associated with an asset, the costs for labor, materials, tools, and services can be rolled up to the asset when the work order is closed. When you roll up maintenance costs for an asset, the cost is rolled up to the top-level asset in the hierarchy that the asset belongs to.

Costs can be rolled up manually or automatically. By default, cost rollups are manual. If you want costs to be calculated and rolled up automatically when a work order is closed, you must set the `mxe.workorder.rollupMaintenanceCosts` system property to 1. After you configure the system property for automatic rollups, all subsequent costs that are associated with work orders are rolled up automatically. However, any unprocessed maintenance costs that existed before the configuration are not automatically rolled up. You must roll up any preexisting, unprocessed maintenance costs manually.

If you upgrade to Maximo® Manage 8.5, run the Maintenance Cost Rollup Report to roll up pending maintenance costs before the upgrade.

## Procedure

---

1. In the Assets application, from the More Actions menu, select Roll Up Maintenance Costs.

The Maintenance Cost Rollup window lists assets that have pending maintenance costs to roll up and any assets for which cost rollups failed.
2. Optional: To review the asset hierarchy for an asset, click the Show Hierarchy icon on the asset row.
3. To roll up maintenance costs, select one of the following options:
  - To roll up maintenance costs for a single asset, select the asset and then click the Roll Up Costs icon on the asset row.
  - To roll up maintenance costs for all assets that are displayed in the window, click Roll Up All Costs.

## Results

---

Maintenance costs are rolled up to the top-level asset in the hierarchy that the asset belongs to.

- [Rolling up maintenance costs by using an automation script](#)

Use an automation script to do a one-time rollup that resolves all preexisting transactions. The script updates the Total Cost and YTD Cost of each asset that is associated with a work order that was closed after you committed your previous rollup.

---

## Rolling up maintenance costs by using an automation script

Use an automation script to do a one-time rollup that resolves all preexisting transactions. The script updates the Total Cost and YTD Cost of each asset that is associated with a work order that was closed after you committed your previous rollup.

## About this task

---

Complete these steps to roll up maintenance costs for your assets by using an automation script.

## Procedure

---

1. Download the [automation script](#). Copy the script to a location that is accessible by Maximo® Manage.
2. To create the automation script, log in to Maximo Manage as an administrator.

3. Go to Automation Scripts from the side menu, and select More Actions...>Create...Script.
4. In the Create Script window, enter a name and description for your script.
5. In the Script Language field, enter `jython`.
6. Copy the script from the file that you downloaded to the Script field in the Create Script window.
7. Click Create.  
A system message is displayed to indicate that the script was created successfully.
8. Close the system message.
9. Using a REST client (such as the Firefox RESTClient extension), send the following URL request by using the POST method to start the automation script that you created:  
`http://<maximo_url>:<maximo_port>/maximo/oslc/script/<automation script name>`  
Note: This step can take a few minutes depending on the number of records that must be processed.
10. Confirm the receipt of a status 200, which indicates the rollup process was completed successfully.

---

## Importing asset-related digital data

You can import asset-related digital data into Maximo® Manage from IBM® Digital Twin Exchange. After you configure integration components, you use the Assets application to connect to Digital Twin Exchange and import the data.

- [Overview](#)  
By using the integration between IBM Maximo Manage and IBM Digital Twin Exchange, you can import digital data directly from Digital Twin Exchange into your Manage database to ensure that you can access the latest information that manufacturers provide about the equipment that you own.
- [Configuring the integration](#)  
You must specify an integration endpoint, configure a server certificate, set a prefix identifier, increase the length of a Manage attribute, configure security authorization for object structures, specify the update processing mode that is used for imports, and grant access to an application function to enable the integration between Maximo Manage and Digital Twin Exchange.
- [Importing data from the digital data source](#)  
By using the Assets application, you can import data from Digital Twin Exchange into Maximo Manage. During an import, predefined statuses are assigned to the asset, item, and job plan records that are created in the Manage database. Job-plan-related records might be updated if you import the same digital data into Maximo Manage more than once.
- [Integration mapping](#)  
Integration mapping identifies the data that is mapped in the integration points for spare parts, assets, and job plans from IBM Digital Twin Exchange to IBM Maximo Manage.
- [Customizing the integration](#)  
You can customize integration mapping to populate additional fields in Maximo Manage with incoming data from Digital Twin Exchange.
- [Troubleshooting integration problems](#)  
Troubleshooting is a systematic approach to solving problems that you encounter when you use the integration. The troubleshooting approach is to determine why something does not work as expected and specify how to resolve the problem.

---

## Overview

By using the integration between IBM® Maximo® Manage and IBM Digital Twin Exchange, you can import digital data directly from Digital Twin Exchange into your Manage database to ensure that you can access the latest information that manufacturers provide about the equipment that you own.

Digital Twin Exchange is a source of digital data that is provided by manufacturers. After a manufacturer loads digital data for a piece of equipment into Digital Twin Exchange, a Manage customer who buys that equipment and its digital data can use this integration to import the latest and most accurate digital data for the equipment into their Manage database.

In Maximo Manage, you import digital data by using the Assets application. You connect to the digital data source, preview the products that you are entitled to import, and decide whether you want to import them. When you import digital data, asset-related items, such as assets, spare parts, and job plans are automatically created in the Manage database.

This integration between Maximo Manage and Digital Twin Exchange is unidirectional.

---

## Configuring the integration

You must specify an integration endpoint, configure a server certificate, set a prefix identifier, increase the length of a Manage attribute, configure security authorization for object structures, specify the update processing mode that is used for imports, and grant access to an application function to enable the integration between Maximo® Manage and Digital Twin Exchange.

- [Configuring the integration endpoint](#)  
To ensure that you can retrieve the digital data that you are entitled to from Digital Twin Exchange, you must configure the `mxe.dtexendpoint` system property to specify the location of the Digital Twin Exchange server.
- [Configuring the server certificate](#)  
To enable secure communication between Maximo Manage and Digital Twin Exchange, you must configure a secure socket layer (SSL) certificate for Digital Twin Exchange. You use your application server to add the certificate authority (CA) SSL certificate as a signer certificate to your trusted key store.
- [Configuring the integration prefix for database records](#)  
To help you identify records in the Manage database that originate from Digital Twin Exchange, you configure the `mxe.dtexprefix` system property. You specify a value that is prefixed to asset, item, and job plan numbers that are created in the Manage database during imports from Digital Twin Exchange. The default value for this prefix is `DT-`.

- [Configuring the length of the ASSETNUM attribute](#)  
To ensure that a field length error does not occur during an import, you must increase the length of the ASSETNUM attribute in the ASSET object.
- [Configuring security authorization for object structures](#)  
To avoid security issues when you import digital data, you must configure security authorization in Maximo Manage for the MXITEM, MXAPIASSETSPARE, and MXAPIJOBPLAN object structures.
- [Configuring the update mode for job plan data](#)  
You can configure how existing job-plan-related items, such as job tasks and work assets, are updated in Maximo Manage when the same digital product is imported more than once. You configure a system property to specify the update mode, which can be either replace or merge. The default update mode is merge.
- [Granting access to the digital data import functionality](#)  
Access to the digital data import functionality is controlled by security signature options, which are defined in the Security Groups application. By using signature options, you can grant access to the digital data import functionality to specific groups of users.

---

## Configuring the integration endpoint

To ensure that you can retrieve the digital data that you are entitled to from Digital Twin Exchange, you must configure the mxe.dtendpoint system property to specify the location of the Digital Twin Exchange server.

---

### Procedure

1. In the System Properties application, in the Global Properties section, filter for and expand the mxe.dtendpoint property.
2. In the Global Value field, update the host name in the URL to point to the location of the Digital Twin Exchange server.
3. Save the changes and click Live Refresh to update the values in the database.

---

## Configuring the server certificate

To enable secure communication between Maximo® Manage and Digital Twin Exchange, you must configure a secure socket layer (SSL) certificate for Digital Twin Exchange. You use your application server to add the certificate authority (CA) SSL certificate as a signer certificate to your trusted key store.

---

### About this task

You might also need to add the trusted key store into the server XML, synchronize server nodes, or restart the server. For more information about how to configure an SSL certificate, see the documentation for your application server.

---

## Configuring the integration prefix for database records

To help you identify records in the Manage database that originate from Digital Twin Exchange, you configure the mxe.dtexprefix system property. You specify a value that is prefixed to asset, item, and job plan numbers that are created in the Manage database during imports from Digital Twin Exchange. The default value for this prefix is DT-.

---

### Procedure

1. In the System Properties application, in the Global Properties section, filter for and expand the mxe.dtexprefix property.
2. In the Global Value field, specify the prefix.
3. Save the changes and click Live Refresh to update the values in the database.

---

## Configuring the length of the ASSETNUM attribute

To ensure that a field length error does not occur during an import, you must increase the length of the ASSETNUM attribute in the ASSET object.

---

### Procedure

1. In the Database Configuration application, filter for and open the ASSET object.
2. On the Attributes tab, filter for the ASSETNUM attribute.
3. In the Details section, set the value in the Length field to 25.
4. Click Save.
5. Update the database to enable these changes to take effect.

---

## Configuring security authorization for object structures

To avoid security issues when you import digital data, you must configure security authorization in Maximo® Manage for the MXITEM, MXAPIASSETSPARE, and MXAPIJOBPLAN object structures.

## Procedure

---

1. In the Object Structures application, filter for and open the MXITEM object structure.
2. Click the Configure Object Structure Security action.
3. In the Configure Object Structure Security window, ensure that the Use Object Structure for Authorization Name check box is selected.
4. Ensure that the Visible check box is selected for all signature options and click OK.
5. Repeat steps 1 to 4 for the MXAPIASSETSPARE and MXAPIJOBPLAN object structures.
6. In the Users application, filter for and open the MXINTADM user.
7. Click the Groups tab and note the security groups that this user belongs to.
8. In the Security Groups application, perform the following actions for each security group that the MXINTADM user belongs to:
  - a. On the Object Structures tab, filter for and open the MXITEM object structure.
  - b. In the security options section, click Grant Listed Options for This Object Structure.
  - c. Repeat steps a and b for the MXAPIASSETSPARE and MXAPIJOBPLAN object structures.
  - d. Save your changes.

---

## Configuring the update mode for job plan data

You can configure how existing job-plan-related items, such as job tasks and work assets, are updated in Maximo® Manage when the same digital product is imported more than once. You configure a system property to specify the update mode, which can be either replace or merge. The default update mode is merge.

### About this task

---

When you use replace for the update mode, if a job-plan-related item, such as a job task, is associated with a job plan in Maximo Manage, but is no longer associated with that job plan on the incoming digital record, the job task is deleted from the Manage job plan. When you use merge for the update mode, the job task is not deleted. In both scenarios, job tasks that are associated with a Manage job plan and remain associated with that job plan on the incoming record are updated, and new job tasks are created if required.

## Procedure

---

1. In the System Properties application, in the Global Properties section, filter for and expand the mxe.dtbodyplanaction property.
2. In the Global Value field, enter REPLACE or MERGE depending on which mode you want to use.
3. Save the changes and click Live Refresh to update the values in the database.

---

## Granting access to the digital data import functionality

Access to the digital data import functionality is controlled by security signature options, which are defined in the Security Groups application. By using signature options, you can grant access to the digital data import functionality to specific groups of users.

## Procedure

---

1. In the Security Groups application, on the List tab, select the group to be granted access.
2. On the Applications tab, in the Description column, click Assets.
3. In the panel that lists the actions that are associated with the Assets application, filter for the Import Digital Data action.
4. Select the Grant Access check box and save your changes.

---

## Importing data from the digital data source

By using the Assets application, you can import data from Digital Twin Exchange into Maximo® Manage. During an import, predefined statuses are assigned to the asset, item, and job plan records that are created in the Manage database. Job-plan-related records might be updated if you import the same digital data into Maximo Manage more than once.

- [Integration overview](#)  
When you import digital data into Maximo Manage from Digital Twin Exchange, asset-related items, such as assets, spare parts, and job plans, are automatically created in the Manage database.
- [Importing digital data](#)  
You use the Assets application to import digital data into Maximo Manage. When the import is complete, asset-related and job-plan-related database records are automatically created for the products that you select.
- [Initial statuses of import-related records](#)  
When you import digital data into Maximo Manage, a predefined status is assigned to each asset, item, and job plan record that is created in the database.
- [Processing of job-plan-related components](#)  
When you import the same digital data more than once, job-plan-related components for that data, such as job tasks and work assets, are updated in Maximo Manage, and some components might be inserted or deleted.

---

## Integration overview

When you import digital data into Maximo® Manage from Digital Twin Exchange, asset-related items, such as assets, spare parts, and job plans, are automatically created in the Manage database.

You use the Assets application to import digital data into Maximo Manage. You specify the digital data source and the connection parameters. The connection parameters are your IBMid and your Digital Twin Exchange key.

You request a preview of product data from Digital Twin Exchange. The connection parameters and the URL that is configured in the mxe.dtendpoint system property are used to connect to Digital Twin Exchange and request the digital data.

The list of products that you are entitled to import is displayed, and you decide whether you want to import them. You can select individual products to import from the list.

When you import a digital product, asset-related and job-plan-related data is retrieved from Digital Twin Exchange for the product that you select, and corresponding records are created in the Manage database. Records for spare parts, attachments, and job plans can be created and updated during import processing. Asset records can be created but cannot be updated.

To prevent database dependency issues, records are created in the Manage database in the following order:

1. Item records for spare parts
2. Asset records
3. Job plan records
4. Attachment records

The value that is specified in the mxe.dtxeprefix system property is prefixed to internal identifiers to set the item, spare part, and job plan numbers in the database. The importing of each digital data product requires several calls to Digital Twin Exchange APIs. If an API call fails, that product and any remaining unimported products are not imported. For example, when you attempt to import four products, if the first two are imported successfully but the third is not because an API call fails, then both the third and fourth products are not imported.

During an import, asset-related and job-plan-related records are created in Maximo Manage for only the default site and organization that are associated with the current user session.

---

## Importing digital data

You use the Assets application to import digital data into Maximo® Manage. When the import is complete, asset-related and job-plan-related database records are automatically created for the products that you select.

---

### Procedure

1. In the Assets application, click the Import Digital Data action.
2. Review the request parameters:
  - Ensure that the Digital Twin Email parameter contains the IBMid that you use to access Digital Twin Exchange.
  - Ensure that the Key parameter contains the key that you use in Digital Twin Exchange.
3. Click Request Data.
4. Review the list of matching products and select the products that you want to import.
5. Click Import Data to import the products that you select or click Cancel to exit.

---

## Initial statuses of import-related records

When you import digital data into Maximo® Manage, a predefined status is assigned to each asset, item, and job plan record that is created in the database.

The following table indicates the status that is assigned to each Manage record after the import is complete:

Table 1. Initial statuses of Manage records after digital data is imported

Record	Initial status
Asset	NOT READY
Item record for spare part	ACTIVE
Job Plan	DRAFT

---

## Processing of job-plan-related components

When you import the same digital data more than once, job-plan-related components for that data, such as job tasks and work assets, are updated in Maximo® Manage, and some components might be inserted or deleted.

The following processing occurs when digital data that already exists in Maximo Manage is imported again:

- If a component that is associated with the job plan in Maximo Manage matches a component in the incoming digital record for that job plan, the Manage component is replaced by the incoming component.
- If a new component is associated with the job plan in the incoming digital record, the new component is created for the job plan in Maximo Manage.
- If a component that is associated with the job plan in Maximo Manage is no longer associated with the job plan in the incoming digital record, one of the following actions is taken based on the update mode that is configured:
  - If you are using replace for the update mode, the Manage component is deleted.
  - If you are using merge for the update mode, the Manage component is not deleted.

## Integration mapping

Integration mapping identifies the data that is mapped in the integration points for spare parts, assets, and job plans from IBM® Digital Twin Exchange to IBM Maximo® Manage.

- **Spare parts**  
The spare parts integration point uses the internal API for the MXITEM Manage object structure and the ITEM Manage destination object.
- **Assets**  
The assets integration point uses the internal APIs for the MXAPIASSETSPARE Manage object structure and the ASSET and SPAREPART Manage destination objects.
- **Job plans**  
The job plans integration point uses the internal APIs for the MXAPIJOBPLAN Manage object structure and the JOBPLAN, JOBTASK, and JPASSETSPLINK Manage destination objects.

## Spare parts

The spare parts integration point uses the internal API for the MXITEM Manage object structure and the ITEM Manage destination object.

The following table outlines the relevant mapping for this integration point:

Table 1. Mapping for spare parts

Digital Twin Exchange source field	ITEM attribute	Data type	Length
[DTE prefix]  "-"  ID	ITEMNUM	Upper	30
NAME	DESCRIPTION	ALN	200
DESCRIPTION	DESCRIPTION_LONGDESCRIPTION	ALN	32000
"ACTIVE"	STATUS	Not applicable	Not applicable
ITEMIMAGE	Not applicable	Not applicable	Not applicable
"DTEX"	SOURCESYSID	ALN	10

[DTE prefix] is the prefix that is configured in the mxe.dtexprefix system property.

## Assets

The assets integration point uses the internal APIs for the MXAPIASSETSPARE Manage object structure and the ASSET and SPAREPART Manage destination objects.

The following table outlines the relevant mapping for this integration point:

Table 1. Mapping for assets

Digital Twin Exchange source field	ASSET attribute	SPAREPART attribute	Data type	Length
PRODUCT_ID-SEQNR	ASSETNUM	Not applicable	Upper	25
NAME	DESCRIPTION	Not applicable	ALN	200
DESCRIPTION	DESCRIPTION_LONGDESCRIPTION	Not applicable	ALN	32000
ITEMIMAGE	Not applicable	Not applicable	Not applicable	Not applicable
Not applicable	Not applicable	ITEMSETID	Upper	8
Not applicable	ORGID	ORGID	Upper	8
"DTEX"	SOURCESYSID	Not applicable	ALN	10
PRODUCT_ID	EXTERNALREFID	Not applicable	ALN	10
[DTE prefix]  "-"  ID (of spare part)	Not applicable	ITEMNUM	Upper	30
QUANTITY	Not applicable	QUANTITY	DECIMAL	15.2

[DTE prefix] is the prefix that is configured in the mxe.dtexprefix system property.

The value of the SPAREPART.ITEMSETID attribute is set to the item set that is associated with the current session for the user who imports the data.

The values of the ASSET.ORGID and SPAREPART.ORGID attributes are set to the organization that is associated with the current session for the user who imports the data.

## Job plans

The job plans integration point uses the internal APIs for the MXAPIJOBPLAN Manage object structure and the JOBPLAN, JOBTASK, and JPASSETSPLINK Manage destination objects.

The following table outlines the relevant mapping for this integration point:

Table 1. Mapping for job plans

Digital Twin Exchange source field	JOBPLAN attribute	JOBTASK attribute	JPASSETSPLINK attribute	Data type	Length
[DTE prefix]  "-"  ID (of job plan)	JPNUM	Not applicable	JPNUM	Upper	12
NAME	DESCRIPTION	Not applicable	Not applicable	ALN	200
DESCRIPTION	DESCRIPTION_ LONGDESCRIPTION	Not applicable	Not applicable	ALN	32000
"DTEX"	SOURCESYSID	Not applicable	Not applicable	ALN	10
TASK	Not applicable	JPTASK	Not applicable	Integer	12
DESCRIPTION	Not applicable	DESCRIPTION	Not applicable	ALN	200
SEQUENCE	Not applicable	TASKSEQUENCE	Not applicable	Integer	12
DURATION	Not applicable	TASKDURATION	Not applicable	Duration	8
PRODUCT_ID-SEQNR	Not applicable	Not applicable	ASSETNUM	Upper	30
Not applicable	Not applicable	Not applicable	PLUSCJPREVNUM	DECIMAL	15.2
Not applicable	Not applicable	Not applicable	SITEID	Upper	8
Not applicable	Not applicable	Not applicable	ORGID	Upper	8

[DTE prefix] is the prefix that is configured in the mx.dtexprefix system property.

The values of the JPASSETSPLINK.SITEID and JPASSETSPLINK.ORGID attributes are set to the site and organization that are associated with the current session for the user who imports the data.

## Customizing the integration

You can customize integration mapping to populate additional fields in Maximo® Manage with incoming data from Digital Twin Exchange.

- [Customizing integration mapping](#)

You can create an automation script to customize mapping for an integration point in the integration between Maximo Manage and Digital Twin Exchange. You specify the additional Manage fields that you want to populate with incoming Digital Twin Exchange data during an import.

## Customizing integration mapping

You can create an automation script to customize mapping for an integration point in the integration between Maximo® Manage and Digital Twin Exchange. You specify the additional Manage fields that you want to populate with incoming Digital Twin Exchange data during an import.

## About this task

The default integration mapping for assets maps the incoming Digital Twin Exchange product identifier to the ASSETNUM attribute in the ASSET object in Maximo Manage. You can customize this mapping to also map the Digital Twin Exchange product identifier to the SERIALNUM attribute in the ASSET object.

## Procedure

1. In the Automation Scripts application, select the Create>Script for Integration action.
2. Select Object Structure as the integration component.
3. In the Object Structure field, select MXAPIASSETSPARE.
4. Select Inbound Processing as the processing point.
5. In the Script Language field, select python.
6. In the bottom section, paste the following script:

```
from psdi.mbo import MboConstants
from com.ibm.tivoli.maximo.digitaldata import digitaltwin
from psdi.server import AppService, MXServer

def afterMboData(ctx):
 ctx.log("afterMboData")
 if ctx.getMbo() is not None:
 dtServer = MXServer.getMXServer().lookup("DIGITALTWIN")
 if ctx.getMbo().isBasedOn("ASSET"):
 # get product id
 assetnum = ctx.getMbo().getString("assetnum")
 indx = assetnum.rindex("-")
 id= assetnum[0:indx]
```

```
get products api response body
productPayload = dtServer.getProducts(id)

get productid from response
productId = str(productPayload.get("id"))

#set maximo serialnum to product id
ctx.getMbo().setValue("serialnum", productId)
```

7. Click Create.

---

## Troubleshooting integration problems

Troubleshooting is a systematic approach to solving problems that you encounter when you use the integration. The troubleshooting approach is to determine why something does not work as expected and specify how to resolve the problem.

- [Database field lengths must be increased](#)  
If a digital data import fails because the length of a Manage field that is specified in an integration mapping is too small, a database administrator must increase the field length in Maximo Manage.
- [Authentication to the digital data server fails](#)  
If a digital data import fails because a connection request to the Digital Twin Exchange server cannot be authenticated, you might need to update the connection parameter values or verify that a secure socket layer (SSL) certificate for Digital Twin Exchange is configured correctly.
- [Digital data cannot be retrieved from the digital data server](#)  
If asset-related or job-plan-related data cannot be retrieved from Digital Twin Exchange during an import, the Digital Twin Exchange APIs might not be available.

---

## Database field lengths must be increased

If a digital data import fails because the length of a Manage field that is specified in an integration mapping is too small, a database administrator must increase the field length in Maximo® Manage.

---

### Symptoms

The digital data import fails to complete.

---

### Causes

A value in the incoming record from the digital data source could not be mapped to the destination field in Maximo Manage because the length of the Manage field is too small to accommodate the value.

---

### Diagnosing the problem

In the digital data list, review the error message for the item that was not imported to determine which Manage field needs to have its length increased. You can also search the Manage log files for more information about which Manage field is affected by the error.

---

### Resolving the problem

To increase the length of the field that causes the error:

1. In the Database Configuration application, filter for the Manage object in the error message.
2. On the Attributes tab, filter for the attribute that caused the import to fail.
3. In the Details section, increase the value in the Length field.
4. Click Save.
5. Update the database to enable these changes to take effect.

---

## Authentication to the digital data server fails

If a digital data import fails because a connection request to the Digital Twin Exchange server cannot be authenticated, you might need to update the connection parameter values or verify that a secure socket layer (SSL) certificate for Digital Twin Exchange is configured correctly.

---

### Symptoms

When you request a preview of digital product data from Digital Twin Exchange, the connection request to the Digital Twin Exchange server fails because an authentication error occurred.

---

### Diagnosing the problem

Review the error message to confirm that the error code and status that are returned from the Digital Twin Exchange server indicate an authentication issue.

---

## Resolving the problem

Ensure that the Digital Twin Email parameter contains the IBMid that you use to access Digital Twin Exchange and that the Key parameter contains the key that you use in Digital Twin Exchange. Verify that a certificate authority (CA) SSL signer certificate for Digital Twin Exchange exists in your trusted key store.

---

## Digital data cannot be retrieved from the digital data server

If asset-related or job-plan-related data cannot be retrieved from Digital Twin Exchange during an import, the Digital Twin Exchange APIs might not be available.

---

### Symptoms

When you import digital product data from Digital Twin Exchange, an error message appears that states that asset, spare part, job plan, or attachment information cannot be retrieved from the digital data source.

---

### Diagnosing the problem

Review the error message to confirm that the error code and status that are returned from the Digital Twin Exchange server indicate that the Digital Twin Exchange APIs are not available.

---

## Resolving the problem

Verify that the Digital Twin Exchange server is running. Contact Digital Twin Exchange support to verify that the Digital Twin Exchange APIs are available.

---

## Asset Templates

You can specify common asset information in an asset template that you can then apply to multiple assets.

You can associate spare parts, meters, and data sheets with the template. Assets that are based on the template inherit these spare parts, meters, and data sheets. You can associate a specification with the asset template on the Specifications tab.

Preventive maintenance information can also be specified for an asset template. When the template is applied to existing assets or new assets, associated PMs, which are based on the master PM, are created for each asset.

You can use asset templates to create multiple assets or to update multiple existing assets.

---

### Example

A pharmaceutical company purchases 100 pressure gauges from the same manufacturer. The pressure gauges share the following identical information:

- Manufacturer
- Model number
- Description
- Operating range
- Accuracy
- Specifications
- Data sheets

A technician creates an asset template to record all the data that is identical. The technician then generates the series of asset records, for the pressure gauges, based on the template. They enter a serial number for each asset number and apply any differences to individual assets.

- [Creating an asset template](#)  
You can specify common asset information in an asset template that you can then apply to multiple assets.

---

## Creating an asset template

You can specify common asset information in an asset template that you can then apply to multiple assets.

---

### About this task

When you create an asset template, the status default value is draft. You can also specify spare parts, set up meters, and associate master PMs, specifications, and data sheets, if required.

---

### Procedure

1. In the Asset Template application, click New Asset Template.
2. Enter an asset template identifier and description.
3. Specify the information for the asset template in the Details section.  
The data in these fields are applied to all assets that is based on the template.
4. Save the asset template.

## What to do next

---

Change the status of the asset template to apply the template to existing assets or to generate multiple assets.

- [Creating assets from an asset template](#)

You can specify common asset information in an asset template that you can then apply to multiple assets. You can generate these assets in the Asset Template application.

- [Applying an asset template to existing assets](#)

When you apply an asset template to an existing asset, the data in the asset template replaces the data in the asset. Any specification records that are created in the template are also replaced.

---

## Creating assets from an asset template

You can specify common asset information in an asset template that you can then apply to multiple assets. You can generate these assets in the Asset Template application.

### Procedure

---

1. In the Asset Templates application, select the asset template that you want to generate assets from.
2. Open the Generate New Assets window:
  - a. Click Generate New Assets.
  - b. Select a site and click OK.
3. Specify the default asset data that you want the assets to share.
4. Specify the quantity of assets that you want to generate.
5. Specify the starting asset number for the series of asset numbers.
6. If your organization requires a prefix or a suffix for the asset number, specify a value.
7. Click Generate Asset.  
The Assets table is populated with assets based on your input.
8. Optional: For assets that are generated with serial numbers, complete the serial numbers so that each asset has the correct unique serial number.
9. Optional: To add an individual asset record, click New Row.
10. Click OK.  
The assets are created based on the asset template.

---

## Applying an asset template to existing assets

When you apply an asset template to an existing asset, the data in the asset template replaces the data in the asset. Any specification records that are created in the template are also replaced.

### About this task

---

To retain any data on the existing assets, leave the corresponding fields blank in the asset template. Template records for spare parts, PMs, meters, and data sheets are added to the records of the assets.

### Procedure

---

1. In the Asset Templates application, select the asset template that you want to apply to existing assets.
2. Open the Apply to Existing Assets window:
  - a. Click Apply to Existing Assets.
  - b. Select a site and click OK.
3. Specify the default asset data that you want the assets to share.
4. Click OK to apply the asset template to the existing assets.

---

## Locations

Use the Locations application to specify and to track locations for assets. You can also organize locations into logical hierarchical systems or network systems. Using hierarchies or systems of locations and specifying the locations for assets on an asset record provides the groundwork for gathering and tracking information about the history of an asset, including its performance at specific sites, as it is moved from location to location. With locations organized into systems, you can quickly find a location on the Drilldown page, and identify the asset at that location.

Use the Locations application to perform the following functions:

- Search for locations, saved queries, and bookmarks.
- View or specify detailed information specific to a location.
- View the history of, move transactions into and out of a selected location.
- View, modify, add, or delete safety records associated with a selected location.
- Associate a meter group with a location, and add and remove meters from a location.
- Type or view the specifications for a location as recorded in the Classifications application.
- View assets at a selected location.
- **[Locations overview](#)**  
Locations and location hierarchies represent functional areas of an organization. Use locations to track movement of assets from place to place. Locations typically are static areas while assets might move to various locations. Write work orders and tickets for locations and charge the costs either to the location or asset. Some locations are virtual, rather than physical.
- **[Working with locations](#)**  
In the Locations application, create locations for virtual or physical sites or areas. Organize locations into hierarchical or network systems. Assign users and custodians for tickets or work to be done at the location. Create tickets and work orders for a location. Associate meters and safety information with locations.

---

## Locations overview

Locations and location hierarchies represent functional areas of an organization. Use locations to track movement of assets from place to place. Locations typically are static areas while assets might move to various locations. Write work orders and tickets for locations and charge the costs either to the location or asset. Some locations are virtual, rather than physical.

- **[Types of locations](#)**  
A location is defined as a place where assets are operated, are stored, or are repaired. Using systems of locations and specifying the location for assets on asset records provides the groundwork for gathering and tracking valuable information about the history of assets, including asset performance at specific sites, and as an asset is moved from location to location.
- **[Managing systems](#)**  
You can create hierarchical systems or network systems to organize your locations. Depending on your needs, you might have one or more systems. Regardless of how many systems you have, each site must have only one primary system.
- **[General ledger account codes](#)**  
If you track records and transactions with general ledger account codes, consider how you use general ledger accounts when you create location records and asset records and their hierarchies and systems.
- **[Meters in locations](#)**  
Adding meters to location records lets you enter meter readings and maintain historical records of meter readings against a location.
- **[Update meter history rules](#)**  
Use the Manage Meter Reading History action in the Locations application to view or to update historical meter readings. When you update a meter reading, the delta (change) readings for that meter that are more recent than the date on which you make the update are applied. Readings taken at a location might roll down to the assets in that location if those assets are set up to accept them. If you require an audit trail of original reading data before an update, use the Audit feature.
- **[Status of locations](#)**  
A location status is an internal value that the system uses with its business logic. Depending on your settings, you can change the status of child locations when you change a parent location.

---

## Types of locations

A location is defined as a place where assets are operated, are stored, or are repaired. Using systems of locations and specifying the location for assets on asset records provides the groundwork for gathering and tracking valuable information about the history of assets, including asset performance at specific sites, and as an asset is moved from location to location.

Locations can be of the following types:

- Operating locations are the location in which an asset operates. Work orders and tickets are written either against the location itself or against the asset in an operating location. Use operating locations when building a location hierarchy.
- Asset types of locations are vendor, salvage, and repair. Assets can be located in asset types of locations. You can track an asset not only as it moves from one operating location to another, but as it moves to a vendor or to a repair location, and perhaps to a salvage location.
- Inventory types of locations are labor and courier. These locations can maintain a balance of an item or items issued from a storeroom. For example, a courier location holding a batch of items issued from a storeroom is responsible for the items until they are received into another location.

---

## Managing systems

You can create hierarchical systems or network systems to organize your locations. Depending on your needs, you might have one or more systems. Regardless of how many systems you have, each site must have only one primary system.

Use the Manage Systems option of the Locations application to perform the following tasks:

- Add a system. The first location you specify for a system becomes the top-level location in the system. For every location you add to the system after the first location, you must specify a parent location. Plan carefully before adding the location to any new system.
- Change a system from a hierarchical type to a network type. Note, you cannot change a network type of system to a hierarchical type of system.

- Select a system to be the primary system. The first system created for a site automatically becomes the primary system. You can make another system the primary system by designating it as the primary system.

---

## General ledger account codes

If you track records and transactions with general ledger account codes, consider how you use general ledger accounts when you create location records and asset records and their hierarchies and systems.

You can assign general ledger accounts to location records, to asset records, or to both. On records or transactions where you specify both a location and an asset identifier, such as a work order, the general ledger accounts of the asset and the location are merged, with general ledger components in the asset taking precedence over general ledger components in the location. This applies if you have general ledger accounts for both types of records. If you specify account codes for both locations and assets, use one component for the location, and another component for the asset.

---

## Meters in locations

Adding meters to location records lets you enter meter readings and maintain historical records of meter readings against a location.

Before you can attach a meter to a location, use the Meters application to add the meter. Use the Assets application to configure assets to accept meter readings from their locations. Then, by adding meters to locations, such as assembly lines, meter readings can roll down to all the assets that are in those locations. The following types of meters are supported:

- Continuous meters measure consumption and are cumulative. These types of meters track items, such as miles traveled, hours elapsed, engines started, pieces produced, or fuel consumed.
- Gauge meters show a range of values, such as fuel levels, temperature, pressure, noise level or, oil level. Gauge meters are recorded via condition monitoring points.
- Characteristic meters are observational in nature and have a list of possible values. These types of meters are used to track items, such as noise level, vibration level, clarity, or color. Characteristic meters are recorded via condition monitoring points.

Meter readings for a location do not roll down to child locations.

---

## Example of temperature meter readings

Use meter readings, such as room temperature, to help you to evaluate whether a heating system or a cooling system is working properly.

---

## Update meter history rules

Use the Manage Meter Reading History action in the Locations application to view or to update historical meter readings. When you update a meter reading, the delta (change) readings for that meter that are more recent than the date on which you make the update are applied. Readings taken at a location might roll down to the assets in that location if those assets are set up to accept them. If you require an audit trail of original reading data before an update, use the Audit feature.

Keep in mind the following considerations when updating meter history:

- A meter reading cannot be less than the previous meter reading unless the meter has a rollover point. The same is true for historical changes. A reading cannot exceed a subsequent reading if the meter does not have a rollover point. Since a meter rollover might be changed, the metadata, including rollover, for an inserted reading is copied from the preceding reading.
- If a reading is deemed acceptable, the averages and cumulative readings are recalculated and the change rolls down the asset hierarchy. Verification is performed to see if any preventive maintenance is due as a result of the meter reading change. This check is performed on all assets whose meter readings are changed.
- Child records are updated as a result of a reading change, and preventive maintenance checks are triggered for those assets. All `METERREADING` entries for reading corrections include the time and date stamp and the user identifier.
- Use the Meters application to insert a meter reading for a date that is earlier than the current meter reading date. When such a record is inserted, the mode of the meter update is verified for the next reading in the history table. If that record was updated by specifying a delta value, then the meter reading is recalculated for that record, as well as for subsequent records that were recorded after the inserted record date. This occurs until it reaches a record that was updated by giving an actual meter reading. The history for the children that were attached to the asset during the inserted record date is updated as well by applying the delta reading of the parent. If the next reading was updated by specifying an actual meter reading, then the inserted record does not affect any subsequent readings.

---

## Status of locations

A location status is an internal value that the system uses with its business logic. Depending on your settings, you can change the status of child locations when you change a parent location.

When you change the status of a location to Decommissioned, you must consider whether the change affects other records. If the location you are decommissioning is on an active route, is part of a safety plan, or is preventive maintenance, you must select the appropriate check box. Otherwise, you cannot change the status of a location to Decommissioned.

To review the route, the safety plan, or the preventive maintenance record, go to the relevant application, where you can remove the location from the record. Return to the location record and change the status to Decommissioned. Decommissioned locations do not appear in select value lists, but they are maintained in the database as historical records and can be accessed from the Locations application.

The following three options are available only when the selected status of a location is Decommissioned:

Roll New Status down to All Assets in All Changed Locations

Select this check box to specify that all assets in all changed locations change to the specified status.

Remove All References to this Location from All Routes

Select this check box to specify that the asset is no longer referenced on active routes while the location is in the specified status. For example, if you set the status of a location to Decommissioned, you might want the location removed from inspection routes.

Remove All References to This Location from All Safety Plans

Select this check box to specify that the locations are no longer referenced on active safety plans while the location is in the specified status.

Change the Status of All Associated PMs to Inactive

Select this check box to specify that any preventive maintenance records associated with the location are set to Inactive while the location is in the specified status.

---

## Working with locations

In the Locations application, create locations for virtual or physical sites or areas. Organize locations into hierarchical or network systems. Assign users and custodians for tickets or work to be done at the location. Create tickets and work orders for a location. Associate meters and safety information with locations.

- [Creating locations](#)  
You can specify and track locations for assets. You can also organize locations into logical hierarchical systems or network systems. Using hierarchies or systems of locations and specifying the location for assets on the asset record provides the groundwork for gathering and tracking information about the history of an asset.
- [Adding locations to one or more collections](#)  
A collection is a group that can contain assets, locations, and classification items. You can add a location to one or more collections and view a list of all the collections to which a selected location belongs.
- [Changing the status of locations](#)  
Use the Change Status action to change the status of an operating location. Operating locations have a designated status that indicates whether they are operational. When you create a location record, the default status is Not Ready.
- [Duplicating location records](#)  
You can create a location record that copies certain information from an existing location record.

---

## Creating locations

You can specify and track locations for assets. You can also organize locations into logical hierarchical systems or network systems. Using hierarchies or systems of locations and specifying the location for assets on the asset record provides the groundwork for gathering and tracking information about the history of an asset.

---

## Procedure

1. On the toolbar of the Locations application, click New Location.
  2. In the Location field, specify a value, and type a description.
  3. In the Type field, type a value. If the type you choose is Operating, you can select the action Associate Systems with Location from the Select Action menu and place this location in a system and relate it to other locations.
  4. Fill additional fields as needed. An asterisk (\*) indicates a required field. Some fields display only if the type is Operating.
  5. Click Save Location.
- [Associating systems with locations](#)  
A location can exist in hierarchical systems, in network systems, or in both types of systems. When you associate a hierarchical system with a location, you must specify the parent for the location within that system. This applies if the new location is not the first location assigned to that system. When you associate a network system with a location, specifying the parent for the location is optional.
  - [Applying item assembly structures](#)  
You use the Apply Item Assembly Structure (IAS) action in the Locations applications to apply an assembly structure to an operating location. If a rotating item in the item assembly structure has child items, the children are also applied to the selected location record.
  - [Associating users and custodians](#)  
You can associate a person with a location as a custodian, as a user, or as both a user and a custodian. A user is the person who uses the location. A custodian is the person who is responsible for the care of the location. A location can have multiple users and multiple custodians.
  - [Associating services with locations](#)  
You can associate one or more services with a location. Examples of services are e-mail support, telecommunications, customer support, and PC support. One of the benefits of associating services with locations is that when you have changes to a service, you can easily identify all the locations that are affected by the change in service.
  - [Associating safety-relating assets with locations](#)  
Use the Locations application to associate assets relating to safety that workers might need to be aware of when they perform work on a selected asset. If the selected asset has hazards or tag outs associated with it, be sure to associate the record with itself. Doing so makes the safety-related information available when creating a safety plan or a job plan for that asset.
  - [Adding meters to locations](#)  
Use the Meters tab to associate multiple meters with an operating location.

---

## Associating systems with locations

A location can exist in hierarchical systems, in network systems, or in both types of systems. When you associate a hierarchical system with a location, you must specify the parent for the location within that system. This applies if the new location is not the first location assigned to that system. When you associate a network system with a location, specifying the parent for the location is optional.

---

### Procedure

1. On the Location tab of the Locations application, display the record to which you want to add one or more systems.
  2. Select the Associate Systems with Location action.
  3. Under the Systems table window, click New Row.
  4. In the System field, specify a value.
  5. In the Parent field, type a value. If the system you selected in step 4 is a hierarchical system, a parent is required unless this is the first location to be associated with that system.
  6. Repeat steps 3 - 5 for each system that you want to associate with this location.
  7. Click OK and click Save Location.
- [Adding parents to locations](#)  
A location in a network system can belong to one or more parents. A location in a hierarchical system can have only one parent.
  - [Replacing parent locations](#)  
Use the Locations application to replace the parent location in a particular system with a different parent location.

---

## Adding parents to locations

A location in a network system can belong to one or more parents. A location in a hierarchical system can have only one parent.

---

### Procedure

1. In the Locations application, on the Location tab, display the location record to which you want to add parent locations.
2. In the Systems table window, select the systems in which you want to add a parent for the current location.
3. Under the Parent table window, click New Row.
4. In the Parent field, type a value, or click Detail Menu and select an option.
5. Repeat steps 3 - 4 for each parent you want to add within the selected systems.
6. Click Save Location.

---

## Replacing parent locations

Use the Locations application to replace the parent location in a particular system with a different parent location.

---

### Procedure

1. From the List tab of the Locations application, display the location record that you want to change.
2. Select the View/Modify Parents action.
3. In the New Parent field, type a value. The parent is validated to ensure the following:
  - a. The parent is in the selected system.
  - b. The parent does not currently exist as the parent to the current location in the selected system.
  - c. The parent does not exist in the child location hierarchy of the selected location.
4. Click OK.

---

## Applying item assembly structures

You use the Apply Item Assembly Structure (IAS) action in the Locations applications to apply an assembly structure to an operating location. If a rotating item in the item assembly structure has child items, the children are also applied to the selected location record.

---

### Procedure

1. In the Locations application, display the location to which you want to apply an item assembly structure.
2. Select the Apply Item Assembly Structure action.
3. To assign numbers to the operating locations in the hierarchy in the Location Hierarchy table, perform either of the following actions:
  - a. To individually assign a value to each item, specify a value in the Current Location field. To number the next item in the hierarchy, click Detail Menu in the Item field, and select Move To. Repeat these steps until you have completed assigning numbers to all the items in the hierarchy.
  - b. To autonumber each rotating item displayed, click Autonumber All.
4. Click OK to close the window.
5. Save the record.

---

## Associating users and custodians

You can associate a person with a location as a custodian, as a user, or as both a user and a custodian. A user is the person who uses the location. A custodian is the person who is responsible for the care of the location. A location can have multiple users and multiple custodians.

### About this task

---

By default, the first person you associate with the location is designated as the primary contact for that location. You can change the primary contact. If a location does not have any users or any custodians, anyone can create a ticket for that location. Self-service users can create requests only for locations that list them as a user or custodian.

### Procedure

---

1. In the Locations application, display the location with which you want to associate users or custodians.
2. Select the Associate Users and Custodians action.
3. Click New Row.
4. In the Person field, type the name of the person that you want to associate with the location.
5. To designate the relationship of the person with the location, perform either or both of the following actions:
  - a. To designate the person as a user, select the User check box.
  - b. To designate the person as a custodian, select the Custodian check box.
6. To designate a person as the primary contact, select the Primary check box. When you select this check box, the system clears the Primary check box in the record of the person previously designated as the primary contact. Only one person can be designated as the primary contact for a location.
7. To add another user or custodian, click New Row.
8. To save the associations and to return to the record, click OK.

---

## Associating services with locations

You can associate one or more services with a location. Examples of services are e-mail support, telecommunications, customer support, and PC support. One of the benefits of associating services with locations is that when you have changes to a service, you can easily identify all the locations that are affected by the change in service.

### Procedure

---

1. From the List tab of the Locations application, display the location with which you want to associate a service or a service group.
2. Select the Associate Services action.
3. Click New Row.
4. In the Service Group field, specify a value.
5. In the Service field, specify a value. If you do not select a service group and you select a service that is associated with a service group, the service group displays in the Service Group field.
6. Click OK to associate the service with the location and to return to the record.

---

## Associating safety-relating assets with locations

Use the Locations application to associate assets relating to safety that workers might need to be aware of when they perform work on a selected asset. If the selected asset has hazards or tag outs associated with it, be sure to associate the record with itself. Doing so makes the safety-related information available when creating a safety plan or a job plan for that asset.

### Procedure

---

1. From the List tab of the Locations application, display the record with which you want to associate a safety-related asset.
  2. On the Safety tab, click the Safety-Related Assets sub tab.
  3. Under the Safety-Related Assets table, click New Row.
  4. In the Asset or in the Location fields, specify a value or click Detail Menu and select an option.
  5. Repeat steps 3 - 4 for each asset that you want to associate with the current record. If the current location record has hazards or tag outs, add its asset identifier to the Safety-Related Assets table window.
  6. Click Save Location.
- [Associating hazards with locations](#)  
You can add hazards to asset records and to location records so that when a work order is created on an asset or location, the appropriate safety information is available. The safety information defined in the Assets application and in the Location application might be added to a safety plan or added directly to the work order.
  - [Associating tag out procedures with location records](#)  
When you associate a tag out procedure with an asset, you first associate a hazard with the asset, then you associate the tag out to eliminate the hazard for that asset. You can add tag out procedures to asset records and to location records so that when a work order is created on an asset or a location, the appropriate safety information is available. The safety information defined in the Assets application and in the Locations application might be added to a safety plan or added directly to the work order.

---

## Associating hazards with locations

You can add hazards to asset records and to location records so that when a work order is created on an asset or location, the appropriate safety information is available. The safety information defined in the Assets application and in the Location application might be added to a safety plan or added directly to the work order.

### Before you begin

---

Before you can add a hazard to a location record, the hazard must have already been defined in the Hazards application.

### Procedure

---

1. From the List tab of the Locations application, open the location record to which you want to associate a hazard.
2. On the Safety tab, click the Hazards and Precautions sub tab.
3. Under the Hazards table window, click New Row.
4. In the Hazard field, click Detail Menu and select an option. If the hazard you selected has precautions associated with it, the precautions are shown in the Precautions table window. If the hazard is hazardous-material-enabled, the hazard is shown on the Hazardous Materials sub tab of the Safety tab, along with its hazardous-material information.
5. Click Save Location.

---

## Associating tag out procedures with location records

When you associate a tag out procedure with an asset, you first associate a hazard with the asset, then you associate the tag out to eliminate the hazard for that asset. You can add tag out procedures to asset records and to location records so that when a work order is created on an asset or a location, the appropriate safety information is available. The safety information defined in the Assets application and in the Locations application might be added to a safety plan or added directly to the work order.

### Before you begin

---

Before you can associate a tag out procedure with an asset, the tag out procedure must be defined in the Lock Out/Tag Out application.

### Procedure

---

1. From the List tab of the Locations application, display the location record with which you want to associate a tag out procedure.
2. On the Safety tab, click the Lock Out/Tag Out sub tab.
3. Under the Hazards table window, click New Row.
4. In the Hazard field, click Detail Menu and select the tag-out-enabled hazard that you want to eliminate.
5. In the Hazards table window, select the hazard with which you want to add a tag out procedure.
6. Under the Tag Out Procedures table window, click New Row.
7. In the Tag Out field, click Detail Menu and select an option to eliminate the hazard.
8. Click Save Location.

---

## Adding meters to locations

Use the Meters tab to associate multiple meters with an operating location.

### Procedure

---

1. From the List tab of the Locations application, display the location to which you want to add a meter.
2. On the Meters tab, under the Meters table window, click New Row. If there is a value in the Meter Group field and there are meters in that meter group, those meters are listed in the Meters table window.
3. In the Meter field, specify a meter or click Detail Menu to select an option and to retrieve a value.
4. If you selected a continuous type of meter, specify the following values for the Average Calculation Method:
  - a. All to calculate the average of all the readings.
  - b. Sliding Days to calculate the average of the readings over a specific number of days.
  - c. Sliding Readings to calculate the average of a specific number of readings.
  - d. Static to set the average and never recalculate it.
5. In the Reading Type field, select Delta to report incremental usage or Actual to report cumulative usage.
6. If the Average Calculation Method is Sliding, specify a value in the Sliding Window Size field for the number of days or the number of readings to use in the calculation.
7. If the Average Calculation Method is Static, specify a value in the Average Units/Day field.
8. Click Save Location.

- [Adding meter readings](#)

Use the Locations application to specify meter readings for a location. A historical reading has a New Reading Date that is prior to the last reading date.

- [Updating meter history](#)

Use the Manage Meter Reading History action in the Locations application to view or to update historical meter readings. When you update a meter reading, the delta (change) readings for that meter that are more recent than the date on which you make the update are applied. Readings taken at a location might roll down to the assets in that location if those assets are set up to accept them.

- [Replacing meters](#)

Use the Reset Meter Readings action to clear the readings for a meter. Use this action when you replace a physical meter after it breaks and you want to replace it. This action is used for continuous type meters. Use this function to record a starting value for the replacement meter.

- [Resetting meters](#)

Use the Reset Meter Readings action to clear the readings for a meter. Use this action when you reset a meter. The Reset/Replace Meters action is for the continuous type of meter.

---

## Adding meter readings

Use the Locations application to specify meter readings for a location. A historical reading has a New Reading Date that is prior to the last reading date.

---

### Before you begin

You must have the appropriate security authorization to specify meter readings.

---

### Procedure

1. On the Meters tab of the Locations application, display the location for which you want to specify meter readings.
2. Select the Enter Meter Readings action.
3. In the New Reading field for that meter, specify a value. The Average Units/Day field value is calculated and displays.
4. Optional: If you specify a delta reading, select the Delta check box. If the location of the meter was set up as a delta reading type, the check box is selected by default.
5. Optional: If you specify an actual reading that is a rollover reading (the new reading value is less than the Last Reading value due to a rollover), select the Rollover check box.
6. Click View Details.
7. In the New Reading Date field, edit the date and time.
8. In the Remarks field, type a comment about the reading.
9. Click OK and click Save Location. If the location is associated with a preventive maintenance, the meter reading fields on the preventive maintenance record are updated.

---

## Updating meter history

Use the Manage Meter Reading History action in the Locations application to view or to update historical meter readings. When you update a meter reading, the delta (change) readings for that meter that are more recent than the date on which you make the update are applied. Readings taken at a location might roll down to the assets in that location if those assets are set up to accept them.

---

### Before you begin

Depending on your security authorization, you might only have the authority to view historical readings and not to update historical readings. If you require an audit trail of original reading data before an update, use the Audit feature.

---

### About this task

If a meter or a location has been added to the hierarchy since the original meter reading, its readings are not updated since it was not present at the time of the original reading. The update stops as soon as the first actual reading is reached. The change is also applied to locations that were attached to the original location at the time the meter reading was taken (reading date) and that can inherit values from the parent. When a reading is modified, the meter reading, the modified date, the user, and a reason for the change are recorded.

---

### Procedure

1. From the List tab of the Locations application, open the location record for which you want to update the meter history.
2. Select the Manage Meter Reading History action.
3. In the Manage Meter History window, click the Continuous Meter Readings tab or the Characteristic and Gauge Meter Readings tab to view and update meters based on their meter types.
4. On the Continuous Meter Readings tab, you can enter the modified reading when the Enter as Delta check box is not selected. Select the Enter as Delta check box to specify a delta for the selected meter.
5. Specify the updated meter readings and click OK.

---

## Replacing meters

Use the Reset Meter Readings action to clear the readings for a meter. Use this action when you replace a physical meter after it breaks and you want to replace it. This action is used for continuous type meters. Use this function to record a starting value for the replacement meter.

---

## Procedure

1. From the List tab of the Locations application, display the location record whose meter you want to replace.
2. Select the Reset/Replace Meters action.
3. To view information for the selected meter, click View Details.
4. Specify a value in the Last Reading field.
5. Click OK to replace the meter and to return to the record.

---

## Resetting meters

Use the Reset Meter Readings action to clear the readings for a meter. Use this action when you reset a meter. The Reset/Replace Meters action is for the continuous type of meter.

---

## Procedure

1. From the List tab of the Locations application, display the location record whose meter you want to reset.
2. Select the Reset/Replace Meters action.
3. To view information for the selected meter, click View Details.
4. Specify values as needed in the Since Last Repair field, in the Since Last Overhaul field, in the Since Last Inspection field, in the Since Install field, in the Rollover field, and in the Average field.
5. Click OK to reset the meter and to return to the record.

---

## Adding locations to one or more collections

A collection is a group that can contain assets, locations, and classification items. You can add a location to one or more collections and view a list of all the collections to which a selected location belongs.

---

## Procedure

1. From the List tab of the Locations application, display the location record whose collections you want to manage.
2. Select the Manage Location Collections action.
3. Click New Row.
4. In the Collection field, type a collection. To select more than one collection, click Select Collections and choose one or more collections.
5. Click OK.

- [Adding locations to collections](#)

A collection is a group that can contain assets, locations, and classification items. A location can be added to more than one collection.

---

## Adding locations to collections

A collection is a group that can contain assets, locations, and classification items. A location can be added to more than one collection.

---

## Procedure

1. On the List tab of the Locations application, filter the list to display the locations that you want to add to a collection.
2. Click Select Record, and select the check box for each location that you want to add to a collection.
3. To select all the locations, select the Select All Records check box in the header row of the Locations window.
4. Select the Add Locations to Collections action.
5. In the Collection field, click Detail Menu to select an option and retrieve a value.
6. Click OK or click Cancel to return to the List tab without adding the selected locations to the collection.

---

## Changing the status of locations

Use the Change Status action to change the status of an operating location. Operating locations have a designated status that indicates whether they are operational. When you create a location record, the default status is Not Ready.

---

## Procedure

1. From the List tab of the Locations application, display the location for which you want to change status.
2. Select the Change Status action.

3. In the New Status field, select a status from the drop-down list. Select Decommissioned as the status only if you intend that status change to be permanent.
4. Click OK.

---

## Duplicating location records

You can create a location record that copies certain information from an existing location record.

### About this task

---

Duplicating a location record copies most of the location information. However, it does not duplicate data specific to a location, such as the data in the Children tables.

### Procedure

---

1. In the Locations application, open the record that you want to duplicate.
2. Select the Duplicate Location action.
3. Specify the details for the new duplicate record.
4. Save the record.

---

## Meters

You use the Meters application to add or to modify meter definitions. Meter definitions include names for the meters as well as sets of attributes that describe the meters. Meters are used to track asset or location performance. An asset or a location can have multiple meters associated with it.

While there may be instances where the same meter is used more than once on the same asset or location, meters in the following applications reflect logical meters:

- Meter Groups
- Assets
- Locations
- Preventive Maintenance
- Job Plans
- Items
- Condition Monitoring

Meters in these applications are used to track meter readings, not physical meters.

- [Meter value resets](#)  
You use the Meters application to reset one or more values relating to a meter. If a preventive maintenance is attached to a given meter, changing the current reading affects the reading at the next preventive maintenance.
- [Working with meters](#)  
You can create meters to track asset or location performance. You can also duplicate or delete meters.

---

## Meter value resets

You use the Meters application to reset one or more values relating to a meter. If a preventive maintenance is attached to a given meter, changing the current reading affects the reading at the next preventive maintenance.

Industries that use rotating equipment rely heavily on the ability to reset meter readings without losing historical information. When a rotating asset is sent out for repair, it might be replaced – requiring meter readings to be reset. When testing an asset, readings might need to be reset upon completion of testing. Changing cumulative readings does not affect preventive maintenance generation, since these values do not drive preventive maintenance. When a meter reading is updated, the Next Meter Reading field is also updated for all the meter-based preventive maintenance that is active against the asset.

---

## Working with meters

You can create meters to track asset or location performance. You can also duplicate or delete meters.

- [Creating meters](#)  
You use the Meters application of the Assets module to add or to modify meter definitions, including the names for the meters and the sets of attributes that describe the meters.
- [Specifying meter readings on work orders](#)  
You can enter meter readings for the asset and the location on a work order. An asset can be set up to inherit the meter readings of its parent asset or its location.
- [Duplicating meters](#)  
The quickest way to create a meter is to duplicate an existing one, and then modify it as needed. When you duplicate a meter, all the information from the existing meter is copied to the new meter.

- [Deleting meters](#)

You use the Meters application of the Assets module to delete meters that you have defined.

---

## Creating meters

You use the Meters application of the Assets module to add or to modify meter definitions, including the names for the meters and the sets of attributes that describe the meters.

### About this task

---

Define the meters whose readings you can use to track the performance of an asset or a location. An asset or a location can have multiple meters associated with it.

### Procedure

---

1. On the toolbar for the Meters application, click New Meter.
2. In the Meter field, type a meter name.
3. In the Meter Description field, type a description.
4. In the Meter Type field, specify the type of meter, as follows:
  - a. If the meter type is characteristic, specify a domain in the Domain field. Only the value associated with this domain is available when this meter is attached to an asset, to a preventive maintenance location, or to a condition monitoring point.
  - b. If the meter type is continuous, specify a reading type in the Reading Type field.
5. Complete the other fields as needed, and click Save Meter.

---

## Specifying meter readings on work orders

You can enter meter readings for the asset and the location on a work order. An asset can be set up to inherit the meter readings of its parent asset or its location.

### About this task

---

To find out if an asset is inheriting meter readings, go to the asset record and check the value in the Accept Rolldown From field.

### Procedure

---

1. Display the record for which you want to enter a reading.
2. From the Select Action menu, select Enter Meter Readings.
3. To enter a meter reading, select either of the following options:
  - To enter a meter reading for the asset, click the Asset Meter Readings tab.
  - To enter a meter reading for the location, click the Location Meter Readings tab. If the asset and location have meters, and the asset inherits the meter reading for the location, enter a reading for either the asset or the location. If the asset has child records that inherit meter readings, the meter readings for the child records are updated. If the location has assets that inherit meter readings for the location, the readings for the assets in that location are updated.
4. In the New Reading field, enter a value, or click Select Value. The system date and time display in the New Reading Date field. The log in name for the user displays in the Inspector field.
5. To change the inspector, specify a value, or click Detail Menu to retrieve a value.
6. To enter the reading and return to the record, click OK.

---

## Duplicating meters

The quickest way to create a meter is to duplicate an existing one, and then modify it as needed. When you duplicate a meter, all the information from the existing meter is copied to the new meter.

### Procedure

---

1. Display the meter you want to duplicate.
2. Select the Duplicate Meter action.
3. Type a value in the Meter field.
4. Modify the meter as necessary, and click Save Meter.

---

## Deleting meters

You use the Meters application of the Assets module to delete meters that you have defined.

## About this task

---

You cannot delete a meter if it is attached to any of the following types of records:

- Asset
- Location
- Item
- Condition monitoring
- Preventive maintenance (applies to master preventive maintenance records only)
- Meter group
- Job plan

## Procedure

---

1. Display the meter record that you want to delete.
2. Select the Delete Meter action.

## Relationships

---

A relationship uses basic terms to describe the dependency or connectivity between configuration items. The basic terms include runs on, installed on, contained, and so forth.

You define and work with relationships in these ways:

- In the Relationships application, you create the formal definitions and accompanying rules for relationships.
- In the Configuration Items application, you associate configuration items with each other using the relationships that you define in the Relationships application.

When you create relationships you specify several properties and rules, including these properties:

- **Directionality** - The directionality of a relationship affects what is found when a user searches for configuration items that are based on relationships. Relationships can be unidirectional, such as installed on or bidirectional.
- **Complementarity** - If a relationship is complementary, one relationship implies another relationship. For example, the relationship of operating system A to computer B is installed on. This relationship implies that the relationship of computer B to operating system A is installed with.
- **Cardinality** - This property specifies whether you can have multiple configuration items as the source and the target. For example, an operating system can be installed on many computers, which is a one-to-many relationship. In addition, a computer can have a one-to-one relationship, which means that the computer runs one operating system.
- **Containment** - This property specifies whether there is a parent-child relationship between configuration items.
- [Relationships overview](#)  
A relationship describes the dependency or connectivity between configuration items. A relationship can be unidirectional or bidirectional. Rules exist for changing or deleting relationships.
- [Creating relationships](#)  
You create relationships to define rules that determine how assets or configuration items relate to each other. These rules affect how you deploy, manage, and search for assets and configuration items.
- [Defining asset relationship rules](#)  
You can apply rules to relationships by classification and attribute.

## Relationships overview

---

A relationship describes the dependency or connectivity between configuration items. A relationship can be unidirectional or bidirectional. Rules exist for changing or deleting relationships.

- [Unidirectional and bidirectional relationships](#)  
A relationship describes the dependency or connectivity between configuration items. A relationship can be either unidirectional or bidirectional. The results of a search are affected when relationships are bidirectional or unidirectional.
- [Asset-based relationships](#)  
A relationship describes the dependency or connectivity between assets. You can define relationships, such as `installed on` or `terminates`, and then apply them to relevant assets.
- [Relationship cardinality](#)  
Cardinality is when you define a relationship, and you specify whether one or more configuration items can be in the source classification and target classification.
- [Relationship change rules](#)  
You can change relationships to fit your business needs.
- [Deletion rules for relationships](#)  
You can delete relationships as your business needs change.

## Unidirectional and bidirectional relationships

---

A relationship describes the dependency or connectivity between configuration items. A relationship can be either unidirectional or bidirectional. The results of a search are affected when relationships are bidirectional or unidirectional.

## Unidirectional relationships

A unidirectional relationship is valid in only one direction. The following phrases are examples of unidirectional relationships: installed on, installed with, contains, member of, starts from, resides on, succeeded by, and preceded by.

For example, an operating system is installed on a computer. A computer is not installed on an operating system. However, in another type of unidirectional relationship, you can specify that a computer contains an operating system.

## Bidirectional relationships

A bidirectional relationship is valid in both directions. Intersects is an example of a bidirectional relationship.

## Search results

The distinction between unidirectional relationships and bidirectional relationships is important when you search configuration items based on relationships.

Relationship	Search results
Bidirectional	<ul style="list-style-type: none"><li>A user searches for all configuration items with an interfaces with relationship to application Z. Since interfaces with is a bidirectional relationship, the search program searches for these occurrences:<ul style="list-style-type: none"><li>The source configuration item is application Z and the relationship is interfaces with.</li><li>The target configuration item is application Z and the relationship is interfaces with.</li></ul></li></ul>
Unidirectional	<ul style="list-style-type: none"><li>For unidirectional relationships, the search program searches for one combination. For example, a user searches for all configuration items with a member of relationship to an EMAIL SERVICE application, where EMAIL SERVICE is the target configuration item. The search program searches for the following occurrence: the target configuration item is EMAIL SERVICE and the relationship is member of.</li><li>You can define one unidirectional relationship to be complementary to another unidirectional relationship. For example, in your relationship definition, you specify that installed on is complementary to installed with. A user wants to find all configuration items that are installed on AppServer K. The search program searches for these occurrences:<ul style="list-style-type: none"><li>The target configuration item is AppServer K and the relationship is installed on.</li><li>The source configuration item is AppServer K and the relationship is installed with.</li></ul></li></ul>

## Asset-based relationships

A relationship describes the dependency or connectivity between assets. You can define relationships, such as `installed on` or `terminates`, and then apply them to relevant assets.

In the Relationships application, you create the formal definitions and accompanying rules for relationships.

In the Assets application, you associate assets with each other by using the relationships.

When creating a relationship between assets, you can define rules to validate that certain conditions are met. A relationship identifies a dependency or connectivity between two assets and the relationship rules validate the following criteria:

- Asset classifications, to ensure that only valid types of assets are related.
- Asset attributes, to ensure that certain values or conditions are met within a classification.

To accommodate complex validations, within a relationship definition multiple rules can be created, related, and grouped.

A relationship can contain none, one, or many validation rules. Each relationship rule consists of the following criteria:

- The classification requirement of the source asset.
- An attribute, a value, and a condition (equal to, less than, and so on) within the source asset classification.
- The classification requirement of the target asset.
- An attribute, a value, and a condition (equal to, less than, and so on) within the target asset classification.

Two or more relationship rules can be grouped together. Within a group, the validation requirement for the combination of rules is determined by the Within Group setting. This value determines whether all conditions must be met, or any one of them.

Similarly, there can be multiple groups of rules. Across all groups, at least one rule group validation condition must be met.

## Linear asset relationships

Asset relationships can be applied to point or linear assets. Linear assets can be defined as segments or layers, where you define an asset's location and how it relates to another.

Linear Asset Manager provides additional features for managing linear assets and is enabled under a separate license key. You must install a Linear Asset Manager license to use linear asset features.

When you are working with a linear asset in the Assets application, under the Relationships tab, you can enter additional linear data for an asset relationship, identifying the start and end measures for source and target assets.

Alternatively, you can select from a list of reference points for the source and target measures. Reference points are enabled by the Use as Reference check box and automatically populate the measures on subsequent reference point selections.

---

## Relationship cardinality

Cardinality is when you define a relationship, and you specify whether one or more configuration items can be in the source classification and target classification.

The following list describes the possible values of cardinality are:

- 1:n - one to many
- 1:1 - one to one
- n:n - many to many

The following table describes the cardinality values:

Cardinality	Relationship rules
1:n	<ul style="list-style-type: none"><li>• A configuration item that belongs to the source classification can have the relationship with multiple configuration items that belong to the target classification.</li><li>• A configuration item that belongs to the target classification can have the relationship with only one configuration item that belongs to the source classification.</li><li>• For example, you specify a 1:n cardinality for an installed with relationship between computer systems and operating systems. Therefore, a computer system instance can be installed with many operating system instances. This 1:n value also implies that an operating system instance can have an installed with relationship with only one computer system instance.</li></ul>
1:1	<ul style="list-style-type: none"><li>• A configuration item that belongs to the source classification can have the relationship with only one configuration item that belongs to the target classification.</li><li>• A configuration item that belongs to the target classification can have the relationship with only one configuration item that belongs to the source classification.</li><li>• For example, you specify a 1:1 cardinality for a runs on relationship between operating systems and computer systems. Therefore, an operating system instance can run on only one computer system instance.</li></ul>
n:1	<ul style="list-style-type: none"><li>• Multiple configuration items that belong to the source classification can have the relationship with only one configuration item that belongs to the target classification.</li><li>• A configuration item that belongs to the target classification can have the relationship with multiple configuration items that belong to the source classification.</li><li>• For example, you specify an n:1 cardinality for an installed on relationship between operating systems and computer systems. Therefore, multiple operating system instances can be installed on one computer system instance. This n:1 value also implies that an operating system instance can be installed on only one computer system instance.</li></ul>
n:n	<ul style="list-style-type: none"><li>• Multiple configuration items that belong to the source classification can have the relationship with multiple configuration items that belong to the target classification.</li></ul>

---

## Relationship change rules

You can change relationships to fit your business needs.

The following list describes the rules regarding changing relationships:

- You cannot change rules that are part of the common data model.
- You cannot delete the rule if any configuration items use the rule.
- You cannot change the containment flag if any configuration items use the rule.
- You cannot change the Is Target Parent setting if any configuration items use the rule.

You can change the cardinality in these ways:

- If 1:1, you can change the cardinality to 1:n, n:1, and n:n.
- If 1:n, you can change the cardinality to n:n.
- If n:1, you can change the cardinality to n:n.

If n:n, you cannot change the cardinality.

---

## Deletion rules for relationships

You can delete relationships as your business needs change.

You cannot delete a relationship when a relationship meets one of these conditions:

- The relationship is used to associate any configuration items.
- The relationship or relationship rule is imported.

---

## Creating relationships

You create relationships to define rules that determine how assets or configuration items relate to each other. These rules affect how you deploy, manage, and search for assets and configuration items.

### Procedure

---

1. In the Relationships application, click the New Relationship icon.
2. Select the type of relationship. Type defines the relationship as either **BIDIRECTIONAL** or **UNIDIRECTIONAL**.
3. In the Use With field, enter or select **ASSET**, for asset relationships, or **CI**, for configuration item relationships.
4. Optional: If the linear asset features are available, specify these options:
  - To use the relationship with linear assets, select **Linear**.
  - To use the relationship as a reference point in linear assets, select **Is Reference Point**.
5. Optional: Specify a complementary relationship.  
Including a complementary relationship allows search programs to find instances of a configuration item when it is a source and when it is a target.
6. Optional: Define asset or CI relationship rules.
7. Save the new relationship.

---

## Defining asset relationship rules

You can apply rules to relationships by classification and attribute.

### Before you begin

---

Ensure that classifications and attributes are defined and understand the relationship rule and group structure for validation purposes.

### Procedure

---

1. In the Relationships application, select a relationship with Use With set to **ASSET**.
2. In the Asset Relationship Rules table, click New Row.
3. Select a source and target classification pair.
4. For grouped rule validation purposes, select the Within Group condition; where **AND** indicates that all rules must be met and **OR** indicates that any one must be met.
5. Optional: For the Source Classification and Target Classification definitions, enter or select a Source Attribute value.
6. Optional: For the Source Classification and Target Classification, enter or select the source attribute Condition value, where:

Option	Description
<b>EQUALS</b>	True if the attribute data equals the value.
<b>NOTEQUAL</b>	True if the attribute data does not equal the value.
<b>GREATER</b>	True if the attribute data is greater than the value.
<b>GREATEROREQUAL</b>	True if the attribute data is greater than or equal to the value.
<b>LESS</b>	True if the attribute data is less than the value.
<b>LESSOREQUAL</b>	True if the attribute data is less than or equal to the value.
<b>LIKE</b>	True if the attribute data contains the text entered in the value. Use for searching text.
<b>NOTLIKE</b>	True if the text entered in the value is not contained within the attribute data. Use for searching text.

7. Optional: For the Source Classification and Target Classification, enter the corresponding Value for the selected Condition.
8. Optional: Add additional lines by using New Row and new groups by changing the Group number.
9. Save your relationship rules.

---

## Meter Groups

You use the Meter Groups application to define a logical grouping of meters that comprise a meter group. Meter groups represent a collection of meters that are used together numerous times.

By creating a meter group, you can add multiple meters to an asset or to a location at the same time. Once meter groups are defined, you can add meters to a group and remove meters from a group. Meter groups can be applied to assets, to locations, and to rotating items using the Inventory Control application to designate the meters associated with a rotating item.

Meter group information is copied to a record under the following conditions:

- An item assembly structure containing rotating items that have meter groups is applied to an asset or to a location record.
- The asset or the location record includes a rotating item number that has a meter group.
- A non-rotating asset or location record is created and a meter group is specified on the Asset tab of the Assets application.

- **Creating meter groups**

You use the Meter Groups application to define a logical grouping of meters. Meter groups represent a collection of meters that are used together multiple times. For example, you can add multiple meters to an asset, to a location, or to a rotating asset at the same time.

---

## Creating meter groups

You use the Meter Groups application to define a logical grouping of meters. Meter groups represent a collection of meters that are used together multiple times. For example, you can add multiple meters to an asset, to a location, or to a rotating asset at the same time.

### Before you begin

---

Meters must be defined in the Meters application before they can be added to a meter group or used in other applications.

### About this task

---

You cannot add multiple meters with the same name to a group. To track readings for multiple meters of the same type for an asset, create unique meter names for each meter.

### Procedure

---

1. On the toolbar, click New Meter Group.
2. In the Meter Group field, specify a unique name for the meter group, and type a description.
3. Select the Apply New Meters Where Group Is Used check box if you want to add the meter to existing assets. If you select this option, the value defaults to the detail section of the record. You can edit this value. If you leave this box unchecked, the meter is added to assets that use this meter group in the future.
4. Click New Row to add meters to the group.
5. Specify the name of the meter you want to add.
6. Complete the remaining required fields.
7. Click Save Meter Group.

- [Duplicating meter groups](#)

A quick way to create a meter group is to duplicate an existing meter group, and then modify it. When you duplicate a meter group, all the information from the existing meter group is copied to the new meter group.

---

## Duplicating meter groups

A quick way to create a meter group is to duplicate an existing meter group, and then modify it. When you duplicate a meter group, all the information from the existing meter group is copied to the new meter group.

### Procedure

---

1. Display the meter group that you want to duplicate.
2. Select the Duplicate Meter Group action.
3. Specify a value in the Meter Group field.
4. Modify the meter group by changing the meter group description and by adding or by deleting meters.
5. Click Save Meter Group.

---

## Condition Monitoring

You use the Condition Monitoring application to create and to view measurement point records for assets and for locations. A measurement point record defines the limits of acceptable meter readings for a characteristic meter or for a gauge meter on an asset or at a location.

In this application, you can generate preventive maintenance work orders. You can also generate work orders with a specific job plan for assets or for locations with meter readings that are outside the defined limits.

- [Condition monitoring overview](#)

Condition monitoring involves using measurement points to define acceptable ranges for meters on an asset or location. When the meter readings exceed the acceptable range, then you can generate work orders to address the situation.

- [Working with condition monitoring](#)

Measurement point records define acceptable condition and performance measurements for a meter on an asset or a location where this type of data is collected. When condition monitoring detects measurements outside of the acceptable range, then you can generate work orders to correct the problem.

---

## Condition monitoring overview

Condition monitoring involves using measurement points to define acceptable ranges for meters on an asset or location. When the meter readings exceed the acceptable range, then you can generate work orders to address the situation.

- [Measurement points](#)

When you inspect an asset or a location, you can record and view the meter readings that correspond to measurement points in the job plan of the associated work order. If the point on the asset or the location on the work order correspond to the meter on the job plan that you are adding to the work

order, the point identifier is inserted in the Measurement Point field on the plan. If a measurement point identifier is used on the work plan of a work order, you cannot delete the corresponding measurement point record.

- [Work orders](#)  
You use the Condition Monitoring application to create work orders that will correct alarm conditions.
- [Work order history](#)

You use the History table on the Condition Monitoring tab in the Assets application to view information about work orders that you generated. Work orders listed in this table were generated using the Condition Monitoring application only, and are listed in order by effective date. You can modify the effective date when you use the Generate Work Order option. The effective date in the History table may not be the date and time the work order was generated. If the preventive maintenance in the PM field of the Condition Monitoring tab was part of a preventive maintenance hierarchy when you used the Generate Work Order option, you generated work orders for the entire hierarchy. Only the work order generated for the preventive maintenance in the PM field displays in the History table.

---

## Measurement points

When you inspect an asset or a location, you can record and view the meter readings that correspond to measurement points in the job plan of the associated work order. If the point on the asset or the location on the work order correspond to the meter on the job plan that you are adding to the work order, the point identifier is inserted in the Measurement Point field on the plan. If a measurement point identifier is used on the work plan of a work order, you cannot delete the corresponding measurement point record.

---

## Work orders

You use the Condition Monitoring application to create work orders that will correct alarm conditions.

When you generate a work order, one of the following actions may occur:

- A work order hierarchy may be created.
- The default safety plans are copied to the work orders.
- The measurement point number may be copied to a work plan operation.

---

## Preventive maintenance work orders

If the preventive maintenance record displayed on the Condition Monitoring tab is part of a hierarchy, generate work orders for the entire preventive maintenance hierarchy when you initiate the work order generation process. Generate work orders for preventive maintenance records above and below the preventive maintenance in the hierarchy. The work order listed in the History table is the one generated for the preventive maintenance in the PM field when you use the Generate Work Order option.

Default safety plans are copied to work orders depending on the asset and on the location shown on the Condition Monitoring tab. Default safety plans are also copied to the job plan associated with the preventive maintenance work orders on the Condition Monitoring tab.

Meter readings are copied to the work plans for the work order, under certain circumstances. When you generate preventive maintenance work orders using the Condition Monitoring tab, the same fields are updated in the preventive maintenance record as are updated when you generate work orders from within the Preventive Maintenance application.

---

## Work order history

You use the History table on the Condition Monitoring tab in the Assets application to view information about work orders that you generated. Work orders listed in this table were generated using the Condition Monitoring application only, and are listed in order by effective date. You can modify the effective date when you use the Generate Work Order option. The effective date in the History table may not be the date and time the work order was generated. If the preventive maintenance in the PM field of the Condition Monitoring tab was part of a preventive maintenance hierarchy when you used the Generate Work Order option, you generated work orders for the entire hierarchy. Only the work order generated for the preventive maintenance in the PM field displays in the History table.

---

## Working with condition monitoring

Measurement point records define acceptable condition and performance measurements for a meter on an asset or a location where this type of data is collected. When condition monitoring detects measurements outside of the acceptable range, then you can generate work orders to correct the problem.

- [Creating measurement point records](#)  
You use the Condition Monitoring application to create measurement point records and associate the records with your assets and locations.
- [Specifying point measurements](#)  
You use the Condition Monitoring application to specify and to view meter readings for your equipment or location measurement points. The Measurements table on the Condition Monitoring tab shows the date, the time, and the value of the measurement.
- [Deleting measurement points](#)  
You use the Condition Monitoring application to delete a measurement point. You can delete measurement points as long as they are not referenced by work orders.
- [Generating work orders to address specific problems](#)  
When the meter reading of an asset or a location is outside of specified limits, you can generate work orders to address the problem.

---

## Creating measurement point records

You use the Condition Monitoring application to create measurement point records and associate the records with your assets and locations.

### Procedure

---

1. From the Condition Monitoring tab of the Condition Monitoring application, click New Measure Point, and type a value in the Point field, if needed.
2. In the Meter field, specify the meter name or click Detail Menu to select a meter for this measurement point.
3. In the Asset or the Location field, type the identifier. If you choose an asset that is associated with a location, the location identifier displays in the Location field.
4. If the meter is of a continuous type, specify the upper and lower warning limits and action limits. In the Upper Warning Limit field and in the Lower Warning Limit field, type the values for the meter readings that define the upper warning limit and the lower warning limit.
5. In the Upper Action Limit field and in the Lower Action Limits field, specify the values for the meter readings that define the upper action limit and the lower action limit. If these limits are reached, these values cause a preventive maintenance or a job plan to be generated when you select the Generate Work Orders action. Measurements at or beyond the warning limits indicate that you must monitor this point carefully. Measurements at or beyond the action limits alert you that the asset or the location may require maintenance or repair.
6. In the Upper Limit PM field or in the Upper Limit Job Plan field, type the identifier of the preventive maintenance record or the job plan record to use on all work orders that you generate for a higher than acceptable reading on this measurement point. The preventive maintenance record or the job plan record must already be associated with the asset or the location, and cannot be a master preventive maintenance record.
7. In the Lower Limit PM field or in the Lower Limit Job Plan field, type the identifier of the preventive maintenance record or the job plan record to use on all work orders that you generate for a lower than acceptable reading on this measurement point. The preventive maintenance record or the job plan record must already be associated with the asset or the location, and cannot be a master preventive maintenance record.
8. In the Upper Limit Priority field, type a value to use when scheduling the upper limit work order.
9. In the Lower Limit Priority field, type a value to use when scheduling the lower limit work order.
10. If the meter type is characteristic, complete the characteristic action values. These are observational readings that result in the initiation of a preventive maintenance or a job plan. Under the Characteristic Action Value table, click New Row.
11. In the Value field, specify a value, or click Detail Menu to select a value for this characteristic action value. You can enter one action value for each type of observation for a given characteristic meter. For example, if a meter has possible values of high, medium, and low, specify one preventive maintenance or one job plan to use if the value is high; one to use if the value is medium; and a third one to use if the value is low.
12. Click Save Measure Point.

---

## Specifying point measurements

You use the Condition Monitoring application to specify and to view meter readings for your equipment or location measurement points. The Measurements table on the Condition Monitoring tab shows the date, the time, and the value of the measurement.

### Procedure

---

1. From the Condition Monitoring tab of the Condition Monitoring application, and under the Measurements table, click New Row.
2. In the Date/Time field, type a date, or click Select Date and Time and select a date on the calendar.
3. Depending on the type of meter, specify the measurement reading in the Measurement field, or click Select Value in the Observation field.

### What to do next

---

Repeat steps 1 to 3 for each reading you want to enter, click Done and then click Save Record.

---

## Deleting measurement points

You use the Condition Monitoring application to delete a measurement point. You can delete measurement points as long as they are not referenced by work orders.

### Procedure

---

1. From the Condition Monitoring tab of the Condition Monitoring application, find the measure point you want to delete.
2. Select the Delete Measure Point action.

---

## Generating work orders to address specific problems

When the meter reading of an asset or a location is outside of specified limits, you can generate work orders to address the problem.

### Procedure

---

1. From the List tab of the Condition Monitoring application, select the records for which you want to generate work orders.

2. Select the Generate Work Orders action.
3. In the Effective Date field, specify the effective date. You can modify this field until you generate the work orders.
4. Optional: In the Memo field, type a short description of the work orders. This field is used only in the Condition Monitoring application. The description is not copied to the Description field of a work order.
5. Optional: If you want to use the action limits of the measurement point as the criteria for generating work orders for an asset, select the Use Action Limits as Work Order Generation Criteria box. When you use the action limits as criteria, you can generate work orders only when meter readings are outside the upper limits or outside the lower action limits.
6. Click OK.

---

## Failure Codes

You use the Failure Codes application to build and to display failure hierarchies. Hierarchies help you construct accurate histories of the failures that affect your assets and operating locations. After reporting and analyzing failure trends, you can take preventive measures. The identifier of a failure hierarchy is the failure class.

- [Failure codes overview](#)  
Failure codes are specified on asset records and on location records. Failure codes are linked in parent-child relationships to form a failure hierarchy.
- [Working with failure codes](#)  
You can build a failure code hierarchy, navigate a failure code hierarchy, copy a failure hierarchy, and copy failure codes.

---

## Failure codes overview

Failure codes are specified on asset records and on location records. Failure codes are linked in parent-child relationships to form a failure hierarchy.

- [Failure hierarchies](#)  
A failure hierarchy is a set of data on the problems, the causes, and the remedies for asset failures and for operating location failures. A failure hierarchy is identified by its failure class. A failure hierarchy resembles other hierarchies. There is a top-level category with one or more levels of failure codes below it. Each failure code can have one or more child failure codes.
- [Failure analysis](#)  
After you have built failure hierarchies, you can record, report and analyze asset and location failures.

---

## Failure hierarchies

A failure hierarchy is a set of data on the problems, the causes, and the remedies for asset failures and for operating location failures. A failure hierarchy is identified by its failure class. A failure hierarchy resembles other hierarchies. There is a top-level category with one or more levels of failure codes below it. Each failure code can have one or more child failure codes.

---

## Failure analysis

After you have built failure hierarchies, you can record, report and analyze asset and location failures.

You can use the Quick Reporting application or the Work Order Tracking application to record asset failures and location failures on work orders. To record failures for a work asset, report failures on work orders for the asset by choosing the appropriate failure codes from the failure hierarchy. If you associate the failure class of an existing failure hierarchy with the asset in the Assets application or the Locations application, then the value is the default value for the failure class on the work order. You can change this default value. If you have not previously associated the failure class of an existing failure hierarchy with the asset in the Assets application or the Locations application, then there is no default value for the failure class. You can select a failure class when you create a work order.

You can use reports to view failure histories of your work assets. Conduct failure analyses to review histories of asset failures and of location failures over time. Look for issues such as breakdown trends or mean time between failures on printed reports. You can correlate this failure information with other data such as preventive maintenance (PM) schedules to develop ways to reduce or limit asset failures in the future.

---

## Working with failure codes

You can build a failure code hierarchy, navigate a failure code hierarchy, copy a failure hierarchy, and copy failure codes.

- [Building failure hierarchies](#)  
You use the Failure Codes application to build failure hierarchies.
- [Navigating failure hierarchies](#)  
A failure hierarchy consists of a top-level failure class and several lower levels of failure codes.
- [Copying failure hierarchies](#)  
You use the Failure Codes application to copy a failure with its causes and remedies from an existing failure hierarchy into a new hierarchy or into a hierarchy that you are modifying.
- [Duplicating failure codes](#)  
You use the Failure Codes application to copy failure codes from an existing failure hierarchy into a new hierarchy or into a hierarchy that you are modifying.

---

## Building failure hierarchies

You use the Failure Codes application to build failure hierarchies.

### About this task

---

A failure hierarchy is a tree type of structure that shows relationships between identified problems, causes, and remedies for asset failures and for operating location failures. Failure hierarchies are built from the top-level of the hierarchy down to the bottom level of the hierarchy.

### Procedure

---

1. Perform the following steps to create the first level of the hierarchy:
  - a. Click New Failure Code.
  - b. In the Failure Class field, type a value.
  - c. In the Failure Class Description field, type a description.
  - d. Under the Problems table, click New Row.
  - e. In the Problem field, type a value, and type a description.
  - f. Repeat steps 3 to 5 for each problem in the hierarchy.
  - g. Click Done and click Save Failure Code.
2. Perform the following steps to create the second level of the hierarchy:
  - a. In the Problem table, select the failure code to which you want to add a cause or a child.
  - b. Under the Causes table, click New Row.
  - c. In the Cause field, type a value.
  - d. In the Description field, type a description.
  - e. Repeat steps 2 to 4 for each cause that you want to add to the selected problem in the hierarchy.
  - f. Click Done and click Save Failure Code.
3. Perform the following steps to create the third level of the hierarchy:
  - a. In the Causes table, select the failure code to which you want to add a remedy or a child.
  - b. Under the Remedies table, click New Row.
  - c. In the Remedy field, specify a value.
  - d. In the Description field, type a description.
  - e. Repeat steps 2 to 4 for each remedy you want to add to the selected cause in the hierarchy.
  - f. Click Done and click Save Failure Code.

---

## Navigating failure hierarchies

A failure hierarchy consists of a top-level failure class and several lower levels of failure codes.

### About this task

---

Typical failure codes are Problem, Cause, and Remedy. Each cause in a hierarchy can have multiple problems. Each problem can have multiple remedies. Navigating the failure hierarchy lets you view the problems that are associated with certain causes, and which causes are associated with specific remedies within a hierarchy. Navigating the hierarchy also lets you identify the problem for which you want to add a cause or a remedy.

### Procedure

---

1. Display the failure code record.
2. In the Problems table, click the row containing the failure code with the children that you want to view. If the failure code has children, the children are displayed in the Causes table.
3. In the Causes table, click the row containing the failure code with the children that you want to view. If the failure code has children, the children are displayed in the Remedies table.

---

## Copying failure hierarchies

You use the Failure Codes application to copy a failure with its causes and remedies from an existing failure hierarchy into a new hierarchy or into a hierarchy that you are modifying.

### Procedure

---

1. Display the record to which you want to copy a failure hierarchy.
2. In the Failure Class field, specify a value.
3. Select the Copy Failure Hierarchy action.
4. Select the check box for the failure class and the problem that you want to copy.
5. Click OK and click Save Failure Code.

---

## Duplicating failure codes

You use the Failure Codes application to copy failure codes from an existing failure hierarchy into a new hierarchy or into a hierarchy that you are modifying.

### About this task

---

Duplicating a failure code is useful when you have an asset, such as a motor, that can be expected to have the same failure class as an existing motor. When you duplicate the failure codes for the existing motor, all of the problems, causes, and remedies associated with that motor are copied to the failure hierarchy for the new motor.

### Procedure

---

1. Display the failure code record that you want to duplicate.
2. Select the Duplicate Failure Code action.
3. In the Failure Class field, specify a value for the new failure class.
4. In the Description field, type a description.
5. Click Save Failure Code.

---

## Building Information Models (BIM) module

You use the applications in the Building Information Models (BIM) module to import building model data in Construction-Operations Building information exchange (COBie) format and then manage and view building models in 3D. You can inspect assets and locations of the building, create work orders and service requests, and search for and create systems from the model.

- [BIM Projects](#)  
You used the BIM Projects application to import building model data in Construction-Operations Building information exchange (COBie) format. You can also define filters, map COBie attributes to existing Manage attributes that include custom attributes, create projects at a site level, and configure global settings for each project. You can import COBie data by using validate, import, update, and merge sessions for the project.
- [Manage BIM Viewer](#)  
You use the Manage BIM Viewer application to view imported building model data in the assets and locations of the buildings and also view the import session details. You can also use a building model viewer to view a 3D version of the building.

---

## BIM Projects

You used the BIM Projects application to import building model data in Construction-Operations Building information exchange (COBie) format. You can also define filters, map COBie attributes to existing Manage attributes that include custom attributes, create projects at a site level, and configure global settings for each project. You can import COBie data by using validate, import, update, and merge sessions for the project.

---

## Manage BIM Viewer

You use the Manage BIM Viewer application to view imported building model data in the assets and locations of the buildings and also view the import session details. You can also use a building model viewer to view a 3D version of the building.

---

## Change module

You use the Activities and Tasks application, located in the Change module, to plan, to review, and to manage activities and tasks.

When you create an activity, you initiate the work process and create a historical record of the work being performed.

- [Changes application](#)  
You use the Changes application to plan, review, and report actuals for implementing changes or deploying new, standard configurations to existing assets. You also can create changes in other applications. A change is a type of work record. Other types of work records are work orders, releases, and activities.
- [Activities and Tasks](#)  
You use the Activities and Tasks application to plan, to review, and to manage activities and tasks. An activity initiates the work process and creates a historical record of the work being performed. Activities are created in the Incidents and Problems applications. A task is a specific unit of work on a work order.

---

## Changes application

You use the Changes application to plan, review, and report actuals for implementing changes or deploying new, standard configurations to existing assets. You also can create changes in other applications. A change is a type of work record. Other types of work records are work orders, releases, and activities.

## The change management process

---

A change typically begins when someone submits a service request to upgrade an original asset. For example, to upgrade a pump with a larger motor. In effect, that person is requesting to change the configuration of that pump. The upgraded pump will have more horsepower, a higher gallon-per-minute rate, and so on, than the original pump asset.

After the service request is approved, a Change is created. The change is written up against the Asset number or CI number of that pump. The configuration of that pump changes from a smaller motor to a larger motor.

Sometimes, a change involves a more complex process such as requiring high-level approvals, in-depth testing, and validation. The process might also include notifying anyone who uses that asset about the pending change and obtaining their approval regarding when the change can occur, and identifying what else the change might affect.

You use the Changes application to define, plan, and schedule the work required to implement a change. You also can use it to assign an owner to the change, categorize the change, and update its status as it moves towards completion. You can relate other records to the change to simplify management of multiple, similar records, and you can create follow-up records directly from the change.

When the change work is completed, you — or the owner of the change — can open the change record and report actual start and finish times, labor hours and costs, material quantities, locations, and costs, and tool quantities, hours, and costs.

- [Changes overview](#)  
A change specifies a particular task, and the labor, materials, services, and tools needed to complete the task.
- [Working with changes](#)  
When you create a change, you specify information about the work that must be performed for an asset, location, or configuration item. You can add work plans or job plans. You can also record actuals as the work progresses.

---

## Changes overview

A change specifies a particular task, and the labor, materials, services, and tools needed to complete the task.

- [Change management plans](#)  
After you create a change, you can use the Plans tab to specify estimates for labor, craft, materials, services, and tools. you also can add child changes and create tasks for the change.
- [Changes](#)  
A change specifies the asset, location, and the work required. You can apply service level agreements and assign ownership. The status of the change is modified as it moves through processing cycle. Duplicating a change can save time when you need to create a change with similar information.
- [Work packages](#)  
When you create a work package, you group existing change under a new parent change. A work package can be useful, for example, when you have a change with 100 separate tasks and 90 of the tasks have been completed. You can group the remaining 10 tasks into a work package with a new parent change. The 10 tasks become tasks under the new change, and any change that are not tasks become children of the new change.
- [Actuals on changes](#)  
As work progresses on the change, you can report the actual labor hours, materials, and tools used.
- [Record relationships](#)  
Relationships between records, such as tickets and work orders, help simplify record management. You can create record relationships manually, or relationships might be created automatically when you take certain actions.
- [Measurement points for work assets on changes](#)  
Work assets on a change can have measurement points, which allow you to track the usage of your assets. You can add measurement points to a change until the change is closed.
- [Preventive maintenance work alerts](#)  
To help reduce the downtime of an asset, you can use PM Alerts to be notified of pending preventive maintenance work that is due near the time that an asset is being repaired or a work order (a change, release, activity, or work order) is generated against a location. With the help of PM Alerts, you can save time and money by performing upcoming routine maintenance while performing non-routine repairs.
- [Work record approval](#)  
When work records, such as work orders, changes, and releases, have a status of Waiting on Approval, you can change the status to Approved.
- [Linear segment details](#)  
You use the Linear Segment Details section to locate a linear segment or point on a linear asset. The Linear Segment Details section, which displays on tabs in several applications, appears only if you are working with a linear asset.
- [Rules for modifying archived changes](#)  
Closed and canceled changes are archived, and become historical records. You might be able to add additional information to a historical record by using the Edit History Change action.
- [Deletion rules for changes](#)  
For auditing purposes, you cannot always delete changes. If you cannot delete a specific change, you can stop all action on a change by changing the status to canceled.

---

## Change management plans

After you create a change, you can use the Plans tab to specify estimates for labor, craft, materials, services, and tools. you also can add child changes and create tasks for the change.

## Job plans

---

An easy way to add a work plan to a change is to associate a job plan with the change. When you insert an identifier in the Job Plan field, the system copies the job plan, called a work plan, to the change. You can also add a job plan by using another application to generate a change that already has a job plan

## Tasks

---

You can insert or edit work plan tasks on the Plans tab. You can also add inspection data for the work asset.

If a current work plan is based on a job plan, the system copies all task and plan data from the job plan. The job plan serves as a template for the work plan. Changes you make to the work plan on the change do not affect the original job plan.

You can add or edit plan tasks until the change is closed. You cannot delete tasks if the change is approved or has actuals reported for the task.

After you close the change, you can use the Edit History Change action to add or modify tasks.

- [Work plan removal](#)  
Under certain circumstances, you can remove a work plan from a change by using the Remove Work Plan action.

---

## Work plan removal

Under certain circumstances, you can remove a work plan from a change by using the Remove Work Plan action.

When you remove a work plan, all information in the Plans tab, except for non-task children, is removed. Also, if the work plan has a job plan, the job plan identifier is removed.

If any task in the work plan cannot be removed based on the deletion rules for changes, you cannot use the Remove Work Plan action. You can still delete labor, material, services, and tools information, as well as any tasks that do meet the deletion rules.

---

## Changes

A change specifies the asset, location, and the work required. You can apply service level agreements and assign ownership. The status of the change is modified as it moves through processing cycle. Duplicating a change can save time when you need to create a change with similar information.

- [Service level agreements](#)  
A service level agreement (SLA) typically is a written agreement that outlines the commitment between a service provider and its customers. A commitment is a service level that all parties have agreed to, such as asset reliability or availability.
- [Ownership of changes](#)  
You can designate an individual or a group as the owner of a change or ticket. Ownership means that the person or group has administration responsibility for that record. Assigning ownership does not change that person or group's availability to work or to have ownership of additional records.
- [Change statuses](#)  
The status of a change indicates its position in the processing cycle. The status determines which actions can be performed on the change. For example, if the change is approved (APPR), then the tasks can start.
- [Duplication of changes](#)  
To save time, you can create a copy of a change that includes information from the original change. You can duplicate a change with its tasks, without its tasks, or with its hierarchy. When you duplicate the change hierarchy, the child tasks are also duplicated.

---

## Service level agreements

A service level agreement (SLA) typically is a written agreement that outlines the commitment between a service provider and its customers. A commitment is a service level that all parties have agreed to, such as asset reliability or availability.

The SLA describes one or more commitments and the escalation actions or notifications associated with each commitment. Escalation actions or notifications might be associated with an SLA to ensure that commitments are met. An escalation process can monitor all activities and send notifications or perform other activities to ensure that commitments are met.

The types of records to which service level agreements can be applied include tickets, such as service requests, and work-based records, such as work orders. Before you can apply an SLA to a record, the record must have a site defined.

A service level agreement can be associated with a record in several ways:

- An SLA might automatically be applied to a record from within a workflow or escalation process, or from another SLA.
- You can select an action to apply an SLA, which applies the best match automatically.
- You can view SLAs and select an action to select or clear the SLAs that you want to manually apply to the record.

When you apply a service level agreement to a record, the following events occur:

- The SLA Applied check box on the main tab of the record is selected to document the action.
- Any escalations that are associated with the SLA are activated.
- The Target Start, Target Finish, and Contact values for the record might be calculated automatically as follows:

Automatically calculated values
When an SLA is applied that includes a response commitment, the response commitment date populates the Target Start date field of the record.
When an SLA is applied that includes a resolution commitment, the resolution commitment date populates the Target Finish date field of the record.
When an SLA is applied that includes a contact commitment, the contact commitment date populates the Target Contact date field of the record.

## Ownership of changes

You can designate an individual or a group as the owner of a change or ticket. Ownership means that the person or group has administration responsibility for that record. Assigning ownership does not change that person or group's availability to work or to have ownership of additional records.

Ownership can change hands throughout the course of the record life cycle. You can change ownership until the record has a status of CLOSE.

You use the View History action to see the ownership and status history of a record. Record ownership is not required for a change or ticket.

You can assign ownership in the following ways:

- Use the Select Owner action to choose a person or owner.
- Use the Take Ownership action if you want to be responsible for that record.

## Change statuses

The status of a change indicates its position in the processing cycle. The status determines which actions can be performed on the change. For example, if the change is approved (APPR), then the tasks can start.

When you change the status of a record, the status of applicable child records that use the inherit status changes option also are changed. If you change the status of global records, the same status change is automatically applied to all globally related records. In addition, the status of a record can be automatically changed. For example, after you assign an owner to a record, the status of that record automatically changes to queued.

A follow-up record can change the status of the originating record, which results in automatic routing or notification of the status change.

### WAPPR

The change is waiting for approval. WAPPR is the default status for records created in the Work Order Tracking, Changes, Releases, and Activities and Tasks applications.

### APPR

The change is approved and the work can begin. Work plan items on an approved change are reserved in inventory, and records cost and rate data. Rates can be changed in the Inventory application, Labor application, or Tools application. If the rates are changed in any application, the work plan reflects the rates in effect when the change was approved.

### WSCH

The change is waiting to be scheduled. WSCH is the default status for records created in the Preventive Maintenance application.

### WMATL

Materials must arrive before the work can be performed.

### WPCOND

The work can be performed only when the condition of the plant is suitable. For example, certain work might require the shutdown of the plant.

### INPRG

The work is in progress. INPRG is the default status for records created in the Quick Reporting application.

### COMP

The physical work is completed. If you want to move or change an asset on a change, the move or change occurs when the status is changed to complete.

### CLOSE

The change is closed. Inventory reservations for items not used in the change are removed and the change is made into a history record.

### CAN

The work is canceled. You cannot cancel a change if the work has already been initiated or if actuals have already been reported. You can use this status when you want to delete a change and deleting is not allowed.

## Duplication of changes

To save time, you can create a copy of a change that includes information from the original change. You can duplicate a change with its tasks, without its tasks, or with its hierarchy. When you duplicate the change hierarchy, the child tasks are also duplicated.

To duplicate a change, use the Duplicate Change action. If the change that you are duplicating has a job plan, the plan is copied to the duplicate change. Work actuals, planned moves or modifications are not copied to the duplicate change.

## Work packages

When you create a work package, you group existing change under a new parent change. A work package can be useful, for example, when you have a change with 100 separate tasks and 90 of the tasks have been completed. You can group the remaining 10 tasks into a work package with a new parent change. The 10 tasks become tasks under the new change, and any change that are not tasks become children of the new change.

To create work packages, select the change, then use the Create Work Package action.

---

## Actuals on changes

As work progresses on the change, you can report the actual labor hours, materials, and tools used.

- **[Actual labor hours for changes](#)**  
To track the actual labor hours that were required to complete the work, you use the Labor subtab on the Actuals tab in the Changes application.
- **[Actual material use for changes](#)**  
To track the actual quantities, locations, and costs for items used on an approved change, you use the Materials subtab on the Actuals tab in the Changes application. You can copy data from an existing plan, modify this data to reflect actual events, or insert new data.
- **[Actual tool use for changes](#)**  
To track the actual quantities, hours, and rates for tools used on an approved change, you use the Tools subtab on the Actuals tab in the Changes application.
- **[Costs on tickets and work orders](#)**  
You can view the estimated and actual costs for a single work order or ticket, including costs for labor, material, tools, and services. You can also view total costs for the current record and all the records below it in its hierarchy.

---

## Actual labor hours for changes

To track the actual labor hours that were required to complete the work, you use the Labor subtab on the Actuals tab in the Changes application.

You can specify and change actual hours for labor only on an approved change. You can copy data from an existing plan, and delete from, add to, or change this data to reflect actual events. You can report labor and crafts until you close the change; however, you can change information only until you save the change.

You can report actual labor hours in the following ways:

- Report hours for multiple types of labor at once.
- Copy labor from the work plan.
- Report labor individually.
- Select planned labor.

---

## Actual material use for changes

To track the actual quantities, locations, and costs for items used on an approved change, you use the Materials subtab on the Actuals tab in the Changes application. You can copy data from an existing plan, modify this data to reflect actual events, or insert new data.

When you issue an item to a change and it is not currently a spare part of the asset on the change, the system may automatically add it to the spare parts list of the asset. You can insert new rows until you close the record, but can edit information only until you save the record.

You can report actual material use in the following ways:

- Select multiple items at once.
- Select items reserved in the inventory, based on the work plan.
- Select spare parts for the asset.
- Report materials individually.

---

## Actual tool use for changes

To track the actual quantities, hours, and rates for tools used on an approved change, you use the Tools subtab on the Actuals tab in the Changes application.

You can copy data from an existing plan, and delete from, add to, or change this data to reflect actual events. Changes must be approved before you can report actuals. You can insert new rows until you close the record, but can edit information only before you save the record.

You can report actual tool use in the following ways:

- Select tools from the database.
- Copy tool data from the work plan.
- Select tools that were issued to the change.
- Report individual tool use.

---

## Costs on tickets and work orders

You can view the estimated and actual costs for a single work order or ticket, including costs for labor, material, tools, and services. You can also view total costs for the current record and all the records below it in its hierarchy.

When you view the costs of a ticket or work order, the data is displayed in two tables:

- The Totals table displays the costs for a single ticket or work order.
- The View Hierarchy Grand Totals table displays the costs for the current ticket or work order and all records under its hierarchy.

Each table presents the same information, which is shown in the following table.

Column	Explanation
Current Estimate	Displays read-only calculated values for the current totals from the Labor, Materials, Standard Services, and Tools tabs of the Plans tab for the ticket or work order.
Estimate at Approval	Is set to zero until the work order is approved, then the values are copied from the Current Estimate column and are read-only. If the work order status changes from approved to unapproved, then these fields are cleared. The estimated costs at approval are not affected by the change in status from in progress to completed or closed.
Actual	Displays the read-only values from the Labor (for approved labor only), Materials, and Tools tabs of the Actuals tab. If the status of the record changes from approved, then these fields are not cleared.

## Rolling up maintenance costs

After you close a work order that is associated with an asset, you can calculate your maintenance costs by rolling up costs that you incur for labor, materials, tools, and services to the top-level asset in the hierarchy that the asset belongs to.

Costs can be rolled up manually or automatically. By default, cost rollups are manual. If you want costs to be calculated and rolled up automatically when a work order is closed, you must set the `mxe.workorder.rollupMaintenanceCosts` system property to 1. After you configure the system property for automatic rollups, all subsequent costs that are associated with work orders are rolled up automatically. However, any unprocessed maintenance costs that existed before the configuration are not automatically rolled up. You must roll up any preexisting, unprocessed maintenance costs manually.

To calculate the maintenance cost of your assets, use the Roll Up Maintenance Costs action in the Assets application.

If you upgrade to Maximo® Manage 8.5, run the Asset Cost Rollup Report to roll up pending maintenance costs before the upgrade.

## Record relationships

Relationships between records, such as tickets and work orders, help simplify record management. You can create record relationships manually, or relationships might be created automatically when you take certain actions.

The types of relationships that can exist between records include:

- Related relationship, which is an informal association of tickets that is used for informational purposes.
- Originator and Follow-up, which keep costs hierarchies separate while still creating a relationship between the tickets.
- Related to Global, which creates a relationship in which the tickets are related to a global issue, which affects many users.

## Related records

Using any ticket or work-based application, you can view similar records and relate tickets and work orders to the current record. A related relationship between records is an informal relationship that is for informational purposes only.

A related relationship does not affect status inheritance, affect workflow, or follow a set of business rules. Related relationships can be many-to-many, and do not represent record hierarchies. By relating records informally, you can navigate to related records, view related information for similar records, and view open tickets that are associated with a field. You can create an informal record relationship in the following ways:

- Use the Related Records tab of the application. This tab provides an easy way to create relationships and to view and navigate among informally related records.
- Use the Show Similar Tickets action in any ticket application. The similar ticket search results only include the service requests, incidents, and problems that have the same classification as the current ticket. Global records and history records are not included in the results. Your system administrator might add more restrictions to the search results.

## Originator and follow-up tickets and work orders

You can relate tickets and work orders to a record more directly when you create a follow-up record from the ticket using one of the Create actions on the ticket. The ticket you create the follow-up record from is the originator. A follow-up record can be a ticket or a work order. In some cases, a follow-up ticket or work order might be able to change the status of its originating ticket. An originating ticket cannot change the status of a follow-up work order, nor can a follow-up ticket change the status of the originator if there is more than one follow-up. These options are configured by the system administrator.

## Globally related tickets

A global ticket is an incident or problem relating to an issue that affects many users. You can relate tickets, including service requests, to a global ticket, which creates a RELATEDTOGLOBAL relationship. This relationship lets you manage the tickets by using the global ticket. When you change the status of the global ticket, the system changes the status of all globally related tickets.

If your administrator has set up automated notifications of status changes, the system changes the status of the tickets related to the global issue. For example, all the initial requestors reporting the same issue are notified of its resolution. On the global ticket, you can also view a list of related records and view the work and

communication logs for all related records.

- **[Deletion of record relationships](#)**

On the Related Records tab, you can delete the relationship between a change and any related work orders or tickets.

- **[Global records](#)**

A global record is a ticket that is a root cause of other issues or that affects many users, such as computer network failures or flooding in a building. After you mark a record as global, you can relate multiple tickets and then manage all tickets using the global record.

---

## Deletion of record relationships

On the Related Records tab, you can delete the relationship between a change and any related work orders or tickets.

You can delete relationships if the change has a relationship type of RELATED. To delete relationships with work orders that have other relationship types, such as FOLLOWUP or ORIGINATOR, you must delete the work order. To delete relationships with tickets to other relationship types, you must go to the tickets applications.

---

## Measurement points for work assets on changes

Work assets on a change can have measurement points, which allow you to track the usage of your assets. You can add measurement points to a change until the change is closed.

Measurement points are copied to work plans when the following items are matched:

- The measurement point name on the job plan that is listed on the change
- The measurement point name on the asset that is listed on the change
- A measurement point number for the measurement point name

If you add a value for a measurement point, the new measurement and measurement date are copied to the measurement database table. If you add a measurement without adding a value for the measurement point, the measurement data is saved with the change. When you save change with measurement point data, the Measurement Point field becomes read-only.

---

## Preventive maintenance work alerts

To help reduce the downtime of an asset, you can use PM Alerts to be notified of pending preventive maintenance work that is due near the time that an asset is being repaired or a work order (a change, release, activity, or work order) is generated against a location. With the help of PM Alerts, you can save time and money by performing upcoming routine maintenance while performing non-routine repairs.

The following conditions apply to using the PM Alert feature:

For the PM Alert message to display, the preventive maintenance record must have its Alert check box selected and the site listed on the record must be set up to display alerts.

When a corrective maintenance work order reaches the status that is specified in PM Options in the Organizations application, and an active PM exists for the asset and/or location on the work order, the system displays the PM Alert dialog box when either of the following criteria is met:

- The system date is on or after the Estimated Next Due Date minus the PM Alert Lead. For example, if the system date is May 25, and the Estimated Next Due Date is June 1 and the Alert Lead is 10 days, the system will display the PM Alert message. The message would be displayed from May 23 through June 1.
- The current meter reading for the asset or location is greater than the Next Meter Reading projection minus the PM Alert Lead. For example, if the asset's last meter reading was 975 units, and the Next Meter Reading is 1,000 units and the PM Alert Lead is 50 units, the system displays the PM Alert message. The message would be displayed when the asset's reading is at least 950.

The PM Alert dialog box displays the alerts for PMs that are due soon for the asset or location, the descriptions of the PMs, the Estimated Next PM Date, and a check box indicating whether the PM is part of a hierarchy. If the PM is part of a hierarchy, the system checks the other PMs in the hierarchy to see if any of those PMs also are due soon.

To generate a work order from the PM Alert dialog box, click the Generate Work Order check box. The system generates a work order for each PM.

---

## Work record approval

When work records, such as work orders, changes, and releases, have a status of Waiting on Approval, you can change the status to Approved.

Keep in mind the following system behavior that pertains to work record approval:

- When you approve a work record, the system reserves the work plan items in Inventory and records cost and rate data. If rates change in Inventory, Labor, or Tools, the work plan reflects the rates in effect when the change was approved.
- An approved record cannot be deleted.
- When you approve a work record, the tasks on the record are also approved.
- If you approve a work record that has child work orders with their Inherit Status Changes? check box selected, the applicable child work orders are also approved.

- You can change the status of multiple work orders at the same time using the Select Records checkbox on the List tab to select the records, or you can change the status of a displayed record.

---

## Linear segment details

You use the Linear Segment Details section to locate a linear segment or point on a linear asset. The Linear Segment Details section, which displays on tabs in several applications, appears only if you are working with a linear asset.

For example, if you specify a linear asset in the Asset field on a preventive maintenance record, the PM tab displays a Linear Segment Details section. If you enter a point asset, the PM tab does not display this section. The Linear Segment Details section includes fields for both the start point and the end point. If you locate a point, such as a stop sign, the start and the end points are the same.

The following terms are associated with linear segments:

### Measure

The absolute distance from the start of a linear asset. You can specify a measure manually. The measure is calculated for you if you enter a reference point and a reference point offset. In the example, using Mile Post 27 and an offset of -528, the calculated measure is 26.9 miles (528 feet = .1 mile).

### Offset

A measure from a previously defined reference point. The possible kinds of offsets are the following:

#### Reference Point Offset

The distance before or after the reference point. Specify an offset value if the segment start or end is before or after the reference point. The value can be negative (before) or positive (after). For example, if the start of the segment is 528 feet before Mile Post 27, type -528.

You cannot specify an offset that, when combined with the reference point, yields a measure that is outside the boundaries of the linear asset. For example, if reference point Mile Post 1 is at 1.0 miles on a linear asset that begins at 0.0 miles, you cannot enter an offset of -2 miles.

#### Y-Offset

A distance perpendicular to the direction of the linear asset. For example, a speed limit sign is located 10 feet from the right edge of the road. "Right" is positive and "left" is negative. Therefore, the Y offset is 10.

#### Z-Offset

A distance above a linear asset or below a linear asset. For example, an exit sign is located 18 feet above the surface of the road, and a culvert is 4 feet below the surface of the road. The Z offset for the sign is 18, and the Z Offset for the culvert is -4.

### Reference point

A feature instance that you can use as a starting point or as an ending point for a linear segment. A reference point is a means of communicating a work location. For example, it can be more useful to workers to say that roadside plowing on Route 96 begins at the intersection of Routes 96 and 75, and ends at Exit 34. It would be less useful to say the work begins at Mile 27.85 and ends at Mile 33.8.

The use of reference points varies according to department practices and to individual variation among linear assets. Some roads might have accurate and persistent mile post markers and workers can rely on them to locate work. Other roads might have few markers or no accurate markers, and users can rely on reference points. Use labels that maintenance workers in the field can easily identify.

Click Select Value to select the reference point.

### Y Reference

The point from which the Y Offset is measured.

The system administrator creates the set of Y Reference values by creating a domain in the Domains application. For roads, some common examples include midline, outer pavement edge, and inner pavement edge. For example, a stop sign is located not just 20 feet from a road, but 20 feet from the midline of a road.

### Z Reference

The point from which the Z Offset is measured.

The system administrator creates the set of Z Reference values by creating a domain in the Domains application. For roads, some common examples include road surface and road bed. For example, an exit sign is located 18 feet above the road surface, or a culvert is 12 feet below the road bed.

---

## Rules for modifying archived changes

Closed and canceled changes are archived, and become historical records. You might be able to add additional information to a historical record by using the Edit History Change action.

When you modify an archived change, the following rules apply:

- New costs that were incurred during the edit history must be added to the inventory cost, if it is charge to store.
- You can add actual labor, but you cannot change approved transactions.
- You can add actual materials and actual tools, but you cannot change them.
- You can add or delete child records, whether the child records are tasks.
- You can attach documents.
- You cannot change planned labor, materials, and tools.
- You cannot change information in the following fields:
  - Asset.
  - Location.
  - GL Account.
  - Charge to Store.
  - Status.

---

## Deletion rules for changes

For auditing purposes, you cannot always delete changes. If you cannot delete a specific change, you can stop all action on a change by changing the status to canceled.

The change and its children must meet the following criteria to be deleted:

- Have a status of waiting for approval
- Not have any transactions registered against it, except for status changes
- Not have any actuals reported against it
- Not have any labor assignments associated with it
- Not have been generated for a purchase order or receipt
- Not be in a workflow or have ever been in a workflow
- Not have any measurements or meter readings taken against it
- Cannot be follow-up work or have follow-up work

To delete a change, use the Delete\_>Change action.

---

## Working with changes

When you create a change, you specify information about the work that must be performed for an asset, location, or configuration item. You can add work plans or job plans. You can also record actuals as the work progresses.

- [Creating changes](#)  
You create a change to implement a change to, or deploy new standard configurations to, existing assets.
- [Reporting actuals for work orders](#)  
As work progresses on an approved work order, you can report the actual labor hours, materials, services, and tools used.
- [Specifying meter readings on work orders](#)  
You can enter meter readings for the asset and the location on a work order. An asset can be set up to inherit the meter readings of its parent asset or its location.
- [Reporting downtime for assets](#)  
You can report the start time and the end time of the downtime for an asset after it has occurred.
- [Swapping assets](#)  
You can swap assets associated with a work order. The swap action applies to the work order and all of the assets, locations, and configuration items on its child work orders. The term "work order" can refer to a work order, change, release, or activity record.
- [Creating related records](#)  
To save time and simplify record management, you can create new records and relate them to your change. New records can be changes, incidents, problems, releases, service requests, and work orders. You can view related records on the Related Records tab.
- [Categorizing changes with classifications and attributes](#)  
To simplify the process of finding and managing records, you can categorize changes. Classifications identify changes as involving a type of item, such as a notebook. Attributes further identify the item by providing more details. For example, a notebook can have the attributes memory, speed, and disk space.
- [Setting up work process flows](#)  
Work process flows use relationships between work orders and tasks to automate the flow of status changes. You set relationships between work orders and tasks so that when a task is completed, the next task in the flow can be initiated.
- [Changing the status of a list of records](#)  
You can change the status of multiple records in applications.

---

## Creating changes

You create a change to implement a change to, or deploy new standard configurations to, existing assets.

---

### Procedure

1. In the Changes application, click the New Change icon.  
A new record appears with a unique ID in the Change field and many fields are completed by the system. The new change is given a status of Waiting on Approval (WAPPR).
2. Complete all the required fields (\*) and the remaining fields, as needed. Typically, you need to complete the following fields on the main tab of the application.

Field	Description
Priority	Specify a priority for the change if you plan to schedule the work.
Location, Asset, Configuration Item, or GL Account	You can create the change for either a location, an asset, a configuration item, or a GL account.
Release Type	Specify the type of the change, such as major, minor, or significant.

Field	Description
Multi Assets, Locations and CIs	After specifying the primary affected asset, location, and configuration item in the designated fields, you can specify multiple related assets, locations, and configuration items in the Multi Assets, Locations, and CIs table window. For example, if you are creating a record to upgrade graphic software on all Product Managers' notebooks, you can define the primary (targeted CI) as Product Managers' Notebooks. Using the Multiple Assets, Locations, and CIs table window, you — or another user — can eventually refine this into the actual list of Product Manager notebooks.

- Save the record.
- Optional: Use the additional tabs in the Changes application to add or modify information for this record, as needed. For example, to apply a job plan to the record, or define hierarchy information, use the Plans tab. Save the record after making additions or changes.

- [Creating work plans for changes](#)

You can create a work plan for a change. A work plan describes the labor, materials, tools, services, and tasks that are needed to complete a change.

- [Applying service level agreements to records](#)

You can apply a service level agreement (SLA) to a record to define the agreement and formal commitments between a service provider and a customer. The agreement documents the service to be provided or received, the agreed upon service levels for the service, and the means of measuring or quantifying the level of service.

- [Applying routes to work orders](#)

You can apply a route to a work order to define a list of related work assets. For example, you can define assets, locations, or a combination of both; each of which is considered to be a stop along the route. The work assets can be related by location, such as all pumps and motors in a room. Or they can be related by the type of asset, such as all fire extinguishers at a site.

- [Creating records from existing records](#)

To create a relationship between two records, you can create a record from an existing record. The record from which you create a change has a relationship type of ORIGINATOR, and the new record has a relationship type of FOLLOWUP.

## Creating work plans for changes

You can create a work plan for a change. A work plan describes the labor, materials, tools, services, and tasks that are needed to complete a change.

### Procedure

- Select the change for which you want to create a work plan.
- On the Plans tab, provide the following information:

Option	Description
<b>Work plan task information</b>	In the Tasks for Change section, add work plan information.
<b>Labor information</b>	On the Labor subtab, select existing labor or add labor.
<b>Planned materials information</b>	On the Materials subtab, provide information for planned materials or items for the change.
<b>Services information</b>	On the Services subtab, select standard services or add services.
<b>Tools information</b>	On the Tools subtab, select tools or add tools.

- Save the work plan.

- [Associating work plans with changes](#)

You can associate an existing work plan with a change. A work plan describes the labor, materials, tools, services, and tasks that are needed to complete a change. Modifications made to the associated work plan do not affect the original job plan.

- [Adding work plan tasks to changes](#)

You can add or change work plan tasks until the change is closed. However, you cannot delete work plan tasks from an approved change or from a change that has actuals reported for the work plan task.

- [Selecting job plans](#)

You can select a job plan for a work order, instead of building a work plan from scratch. The job plan you select becomes the work plan. You can choose a job plan from a list of job plans that are associated with the assets identified on the work order.

- [Creating job plans from work plans](#)

You can create a job plan from the work plan instead of recreating the work plan each time that you need it. When you create a job plan from a work plan, the asset management system uses the current work order and its tasks, planned labor, materials, tools, and services to create the job plan.

## Associating work plans with changes

You can associate an existing work plan with a change. A work plan describes the labor, materials, tools, services, and tasks that are needed to complete a change. Modifications made to the associated work plan do not affect the original job plan.

### Procedure

- Select the change with which you want to associate a work plan.
- In the Job Plan field of the Plans tab, specify the plan that you want to associate.
- Save the change.

## Adding work plan tasks to changes

You can add or change work plan tasks until the change is closed. However, you cannot delete work plan tasks from an approved change or from a change that has actuals reported for the work plan task.

---

## Procedure

1. Select the change to which you want to add work plan tasks.
2. On the Plans tab, in the Tasks for Change section, add a new row.
3. Specify the details of the task.
4. Save the change.

---

## Selecting job plans

You can select a job plan for a work order, instead of building a work plan from scratch. The job plan you select becomes the work plan. You can choose a job plan from a list of job plans that are associated with the assets identified on the work order.

---

## Before you begin

You can only select a job plan for a work order if the work order has no plans. If there are any labor, materials, services, or tools planned, the Job Plan field is read-only.

---

## About this task

When you associate a job plan with a work order, if the job plan has a default safety plan for the selected work asset, the safety plan is also copied to the work order.

---

## Procedure

1. Display the work order for which you want to select a job plan.
2. In the Job Plan field, click Detail Menu, and choose Select Value.
3. Select the Show Job Plans for the Work Order's Asset and Location Only check box. This check box limits the list of job plans displayed to the job plans associated with the asset or location that appear on the work order. To view a list of all job plans, clear the check box, and click Refresh.
4. Click the row containing the job plan to select it and return to the work order.

---

## Creating job plans from work plans

You can create a job plan from the work plan instead of recreating the work plan each time that you need it. When you create a job plan from a work plan, the asset management system uses the current work order and its tasks, planned labor, materials, tools, and services to create the job plan.

---

## About this task

The asset management system does not copy child work orders, if any, to the job plan. If the work assets on the work order have an associated safety plan, the asset management system does not copy the safety plan to the job plan.

---

## Procedure

1. In the Work Order Tracking application, display the work order that contains the plan that you want to use to create a job plan.
2. Select the Create Job Plan from Work Plan action.
3. If the Job Plan field is empty, enter a value, or click Autonumber to have the asset management system assign a number to the job plan.
4. Click OK.

---

## Results

The asset management system creates a job plan record that you can now access in the Job Plans application.

---

## Applying service level agreements to records

You can apply a service level agreement (SLA) to a record to define the agreement and formal commitments between a service provider and a customer. The agreement documents the service to be provided or received, the agreed upon service levels for the service, and the means of measuring or quantifying the level of service.

---

## About this task

When you apply an service level agreement to work orders, the SLA is applied only to the work order, not to its tasks. If you want to apply a service level agreement to a task, you must display the task as the current record and then apply the SLA.

You can apply service level agreements to tickets and work orders.

---

## Procedure

1. Open an application and display the record that you want to update.
2. Select the Apply SLA action.
3. Click OK.

---

## Results

The SLA Applied check box on the main tab of the selected application is selected. The target start, target finish, and contact values are calculated for the selected record.

---

## Removing service level agreements from records

To maintain accurate records, it might be necessary to remove an invalid or erroneous service level agreement to disassociate it from the record.

---

## Procedure

1. Display the record for which you want to remove a service level agreement.
2. Select the Select/Deselect SLA action.
3. Click Mark Row for Delete for each service level agreement that you want to remove from the record.
4. Click OK.
5. Save the record.

---

## Applying routes to work orders

You can apply a route to a work order to define a list of related work assets. For example, you can define assets, locations, or a combination of both; each of which is considered to be a stop along the route. The work assets can be related by location, such as all pumps and motors in a room. Or they can be related by the type of asset, such as all fire extinguishers at a site.

---

## About this task

Each route stop can have its own job plan, which the system copies to the child work order. You can apply a route to a work order in the Work Order Tracking and Quick Reporting applications.

---

## Procedure

1. Open an application and display the work order record that you want to update.
2. Select the Apply Route action.
3. Select the route that you want to apply to the work order.  
A message box opens and displays a list of child work orders that are created from the route.
4. Click Save Work Order.

---

## Results

The created child work orders display as route stops on the Plans tab in the Work Order Tracking application.

---

## Creating records from existing records

To create a relationship between two records, you can create a record from an existing record. The record from which you create a change has a relationship type of ORIGINATOR, and the new record has a relationship type of FOLLOWUP.

---

## Procedure

1. Display the record from which you want to create the related record.
2. Select the Create *Record Type* action where *Record Type* is the type of related record you want to create.
3. Save the record.

---

## Reporting actuals for work orders

As work progresses on an approved work order, you can report the actual labor hours, materials, services, and tools used.

### Procedure

---

1. Display the work order for which you want to report actuals.
2. On the Actuals tab, enter the details on the following subtabs:

Option	Description
<b>Labor</b>	Report hours for labor, copy labor from the work plan, or select planned labor.
<b>Materials</b>	Select materials, select reserved items, and select spare parts.
<b>Services</b>	Select services or standard services.
<b>Tools</b>	Select tools, copy tool data from the work plan, or select tools that were issued to the work order.

3. Save the record.

---

## Specifying meter readings on work orders

You can enter meter readings for the asset and the location on a work order. An asset can be set up to inherit the meter readings of its parent asset or its location.

### About this task

---

To find out if an asset is inheriting meter readings, go to the asset record and check the value in the Accept Rolldown From field.

### Procedure

---

1. Display the record for which you want to enter a reading.
2. From the Select Action menu, select Enter Meter Readings.
3. To enter a meter reading, select either of the following options:
  - To enter a meter reading for the asset, click the Asset Meter Readings tab.
  - To enter a meter reading for the location, click the Location Meter Readings tab. If the asset and location have meters, and the asset inherits the meter reading for the location, enter a reading for either the asset or the location. If the asset has child records that inherit meter readings, the meter readings for the child records are updated. If the location has assets that inherit meter readings for the location, the readings for the assets in that location are updated.
4. In the New Reading field, enter a value, or click Select Value. The system date and time display in the New Reading Date field. The log in name for the user displays in the Inspector field.
5. To change the inspector, specify a value, or click Detail Menu to retrieve a value.
6. To enter the reading and return to the record, click OK.

---

## Reporting downtime for assets

You can report the start time and the end time of the downtime for an asset after it has occurred.

### About this task

---

You can create multiple downtime reports for a single work order.

### Procedure

---

1. Display the record with the asset for which you want to report downtime.
2. Select the Report Downtime action.
3. In the Downtime Report section, select the Report Downtime option.
4. Specify the date the downtime began, or select one of the following options in the Start Date Default section:
  - Reported Date - the date and time the downtime for the asset was reported on the work order.
  - Actual Start Date - the date and time the downtime for the asset actually began.
  - None - no default start date and time.
5. Enter a date the downtime ended or will end.
6. In the Hours field, the system calculates the total downtime hours based upon the start date and the end date. This calculation considers the calendar for the asset. The calculation also considers the elapsed time between the start of downtime, and the end of downtime.
7. In the Downtime Code field, click Select Value to select a code.
8. In the Downtime Type section, select either of the following options:
  - Operational - if the down time occurred when the asset is normally in use
  - Non-Operational - if the down time occurred when the asset is normally not in use.
9. Click OK to report the downtime and return to the record.

---

## Swapping assets

You can swap assets associated with a work order. The swap action applies to the work order and all of the assets, locations, and configuration items on its child work orders. The term "work order" can refer to a work order, change, release, or activity record.

### Before you begin

---

You can execute the swap immediately, or you can save the swap as a plan. If you save the swap as a plan, the changes will apply when the status for the work order is COMP (Complete). When the status of a work order is COMP, you swap assets only using the Execute Now option. When you select Execute Now on any tab, the system executes the changes on all tabs.

When you duplicate a work order that has a planned swap to its assets or locations, the planned action does not get copied to the duplicate work order. Also, when you create a release, or change, or work order from a record using the Select Action menu option, the planned action is not copied to the follow-up record.

### Procedure

---

1. Select the Move/Swap/Modify action.
2. Click the Move/Swap tab.
3. Select the Is this an Asset Swap checkbox.
4. In the Swap Assets section, select the row for the asset you want to swap.
5. To move the asset to a parent or location, type a value in the appropriate field, or click Select Value to retrieve a value.
6. In the Replacement Asset field, specify an asset, or click Select Value to retrieve a value.
7. Perform one of the following actions:
  - To swap the assets immediately, click Execute Now.
  - To swap the assets when the status for the work order is COMP (Complete), click Save as Plan.

---

## Creating related records

To save time and simplify record management, you can create new records and relate them to your change. New records can be changes, incidents, problems, releases, service requests, and work orders. You can view related records on the Related Records tab.

### Procedure

---

1. Select the change for which you want to create related records.
2. From the Select Action menu, select Create > RecordType where RecordType is one of the following types:
  - Work Order
  - Service Request
  - Incident
  - Problem
  - Change
  - Release
  - Communication
- [Assigning a parent to a work order](#)  
You can assign a parent to a work order and assign tasks to that parent. When you assign work order records to a parent, they become child work orders records of the parent record.

---

## Assigning a parent to a work order

You can assign a parent to a work order and assign tasks to that parent. When you assign work order records to a parent, they become child work orders records of the parent record.

### About this task

---

You cannot assign parent records to closed work order records. If the parent has a value in the Priority field, and the child or children work order records do not, the child or children work order records inherit the parent priority value.

### Procedure

---

1. Open an application and display the work order record that you want to update.
2. On the List tab, select the task that you want to update.
3. Select the Assign To New Parent action.
4. Select the work order record that you want as the new parent.  
The asset management system displays the parent work order number in the Parent WO field.
5. Click Save record.

---

## Categorizing changes with classifications and attributes

To simplify the process of finding and managing records, you can categorize changes. Classifications identify changes as involving a type of item, such as a notebook. Attributes further identify the item by providing more details. For example, a notebook can have the attributes memory, speed, and disk space.

### Procedure

---

1. Display the change that you want to categorize.
2. On the Specifications tab, specify a classification.
3. Select the attributes.
4. Save your changes.

- [Categorizing tasks on changes with classifications and attributes](#)

To simplify the process of finding and managing records, you can categorize tasks on changes. Categorizing tasks involves classifying and adding and changing attributes to further group the classification.

---

## Categorizing tasks on changes with classifications and attributes

To simplify the process of finding and managing records, you can categorize tasks on changes. Categorizing tasks involves classifying and adding and changing attributes to further group the classification.

### Procedure

---

1. Display the change with the task that you want to categorize.
2. In the Job Details section of the Plans tab, select the task that you want to categorize.
3. Specify the classification.
4. Optional: You can add attributes, delete attributes, and change the values of the attributes in the row details.
5. Save the change.

### Example

---

A task involves the classification of a notebook. The notebook classification has the attributes of memory, speed, and disk space, which are copied to the change upon classification. As needed, you can add attributes such as operating system and power, change the attribute values, and remove attributes associated with the change.

---

## Setting up work process flows

Work process flows use relationships between work orders and tasks to automate the flow of status changes. You set relationships between work orders and tasks so that when a task is completed, the next task in the flow can be initiated.

### Before you begin

---

To set the process flow for individual tasks, you must select Under Flow Control at the header level for the work order.

### About this task

---

The best practice for consistently using the flow feature is to set up the process flow as a work template at the job plan level.

### Procedure

---

1. Open the work order.
2. Select Under Flow Control.
3. On the Plans tab, display the details for the task.
4. In the Scheduling Information section, next to the Predecessors field, click the Detail Menu icon.
5. Select the tasks that must be completed before this task is initiated.
6. Save the work order.

- [Defining flow actions](#)

A flow action is used in a work process flow to define certain actions that should occur while work is being done. Actions or action groups can be applied to any work order, task, or job plan task.

- [Removing work process flow from work orders or job plans](#)

You can remove work process flow for a work order, a job plan, or task records that have it defined. You can do this at the header level, which will remove it for all the associated tasks as well, or you can remove it at the task level.

- [Suspending work process flows](#)

You can suspend the work process flow for work order or task records that have it defined. For example, if you want to start a work order or task manually,

you could suspend the flow control on that record. The flow remains suspended until you remove the suspension.

- [Stopping workflow processes](#)  
You can stop a workflow process for a record. You use the Workflow Administration application to view and stop workflow processes.

---

## Defining flow actions

A flow action is used in a work process flow to define certain actions that should occur while work is being done. Actions or action groups can be applied to any work order, task, or job plan task.

---

### About this task

You can determine whether the action takes place automatically, or if the action only takes place when it is initiated manually. When automatic, the action takes place as soon as the work order or task status is changed to an in progress (INPRG) status value by work process flow. When manual, you must initiate the flow action by running the automation or processing scripts or placing an action button on the target application. Actions and action groups are defined in the Actions application.

---

### Procedure

1. In an application that supports flow action, display the record for which you want to define a flow action.
2. Perform one of the following actions:
  - For a work order, change, release, or job plan record, enter a value in the Flow Action field on the application tab.
  - For a work order or job plan task, enter a value in the Flow Action field in the Task table window. The Tasks table window is found on the main tab of the Job Plans application, or the Plans tab of the Work Order Tracking, Changes, and Releases applications.

The defined action runs when the work order or task status value is changed to INPRG.

3. Specify whether you want the flow action to be automatically run:

Option	Flow Action Assist
Automatically run the flow action	Cleared
Manually run the flow action	Selected

4. Click Save record.

---

## Removing work process flow from work orders or job plans

You can remove work process flow for a work order, a job plan, or task records that have it defined. You can do this at the header level, which will remove it for all the associated tasks as well, or you can remove it at the task level.

---

### About this task

If work process flow is removed at the header level, it will automatically be removed on individual tasks on the record. You cannot retain work process flow for a task that does not have it set at the header level.

---

### Procedure

1. In an application that supports flow action, display the record that you want to remove from work process flow.
2. On the main application tab, clear the Flow Controlled check box. The system removes the work order or the job plan, and all of its tasks from work process flow.
3. Click Save Record.

---

## Suspending work process flows

You can suspend the work process flow for work order or task records that have it defined. For example, if you want to start a work order or task manually, you could suspend the flow control on that record. The flow remains suspended until you remove the suspension.

---

### Before you begin

Removing the suspension restarts the flow. Any successor work orders or tasks with completed predecessors continue the process. Work orders and tasks without predecessors continue the process at the same time as the parent record. The last completed child under a parent rolls its completion up to the parent.

---

### Procedure

1. In an application that supports flow action, display the record on which you want to suspend flow control.
2. On the main application tab, at the header level, select the Suspend Flow Control check box. The system suspends the work process flow on the work order and on all of its tasks.
3. To retain flow control for individual tasks, display the tasks in the Tasks table window, and clear the Suspend Flow Control check box at the task level. Flow control remains in place at the task level. This action does not affect the suspension at the work order header level. You can find the Tasks table window on

- the Plans tab.
4. Click Save Record.

---

## Example

You generally suspend a set of tasks, often under the same parent. For example, you can delay the automatic starting of one whole phase of work until a certain condition has been met. You can also delay starting a phase of work to make changes to the tasks, such as inserting tasks, deleting tasks, and changing the precedence logic.

---

## Stopping workflow processes

You can stop a workflow process for a record. You use the Workflow Administration application to view and stop workflow processes.

---

### Before you begin

The application associated with the workflow process record must be enabled for workflow.

---

### Procedure

1. To stop a workflow process, complete one of the following steps:
  - In a Workflow-enabled application, display the record you want to remove from Workflow. Select the Stop Workflow action.
  - In the Workflow Administration application, select the active process that you want to stop. Click Stop Process on the assignment line.
2. Optional: Create an e-mail notification. The system defaults to the WFSTOP communication template. You can use the WFSTOP communication template to create the notification. You can also manually specify the subject, message, and role recipients.
3. Click OK. The system stops the workflow process. The system also sends any notifications.

---

## Changing the status of a list of records

You can change the status of multiple records in applications.

---

### Procedure

1. In the Work Order application, on the List tab of an application, filter the records so that less than 200 records are displayed.
2. Scroll down the bottom of the screen and select the Select Records check box.  
The screen refreshes and each row now has a check box.
3. Select the check boxes for the work orders whose status you want to change.
4. Click the Change Status action and enter the information in the dialog box.
5. Click OK to close the Change Status window.

---

## Activities and Tasks

You use the Activities and Tasks application to plan, to review, and to manage activities and tasks. An activity initiates the work process and creates a historical record of the work being performed. Activities are created in the Incidents and Problems applications. A task is a specific unit of work on a work order.

An activity is a type of work order. A task can be created as part of an activity or part of another work order.

You can use the Activities and Tasks application to perform the following functions:

- Change the status of activities and tasks
- Take ownership of activities or tasks
- Assign ownership of activities and tasks to individuals or to workgroups
- Modify activities and tasks to reflect changes
- View related preventive maintenance and scheduling information
- Categorize the activities and tasks using classifications and attributes to simplify their management and retrieval
- Specify, view, and modify job tasks and the labor, material, services, and tool requirements for work plans
- View, add, and delete work orders and tickets that are related to an activity or to a task
- View follow-up records for an activity or a task
- View and create a work log and communication entries about a record
- [Activities and tasks overview](#)  
An activity specifies the tasks, and the labor, materials, services, and tools needed to complete the task. Activities are created to document the required work, which can then be delegated to the individuals responsible for completing the work.
- [Working with activities](#)  
Activities are created in the Incidents and Problems applications. Tasks are created as part of activities and other work orders. You can manage and modify activities and tasks in the Activities and Tasks application. For example, you can change the ownership or status of an activity or task.

---

## Activities and tasks overview

An activity specifies the tasks, and the labor, materials, services, and tools needed to complete the task. Activities are created to document the required work, which can then be delegated to the individuals responsible for completing the work.

- **[Record ownership](#)**  
The owner of a record is the person or person group that is in charge of the record from an administrative perspective.
- **[Activity statuses](#)**  
The status of an activity indicates its position in the processing cycle. The status determines which actions can be performed on the activity. For example, if the activity is approved (APPR), then the tasks can start.
- **[Measurement points](#)**  
When you inspect an asset or a location, you can record and view the meter readings that correspond to measurement points in the job plan of the associated work order. You can also insert measurement points on an activity until the activity or task is closed.
- **[Service level agreements](#)**  
A service level agreement (SLA) typically is a written agreement that outlines the commitment between a service provider and its customers. A commitment is a service level that all parties have agreed to, such as asset reliability or availability.
- **[Record relationships](#)**  
Relationships between records, such as tickets and work orders, help simplify record management. You can create record relationships manually, or relationships might be created automatically when you take certain actions.
- **[Costs on tickets and work orders](#)**  
You can view the estimated and actual costs for a single work order or ticket, including costs for labor, material, tools, and services. You can also view total costs for the current record and all the records below it in its hierarchy.
- **[Work plan removal](#)**  
Under certain circumstances, you can remove a work plan from an activity by using the Remove Work Plan action.
- **[Deletion rules for activities](#)**  
For auditing purposes, you cannot always delete activities. If you cannot delete a specific activity, you can stop all action on an activity by changing the status to canceled.
- **[Rules for modifying archived activities](#)**  
Closed and canceled activities are archived, and become historical records. You might be able to add additional information to a historical record by using the Edit History Activity action.

---

## Record ownership

The owner of a record is the person or person group that is in charge of the record from an administrative perspective.

The owner of a record keeps the customer updated and acts as the point person for any issues involving the work. You can use the Select Owner action to assign record ownership to a person or person group, or you can use the Take Ownership action if you want to take administrative ownership of the record yourself. You can take ownership for more than one application.

Keep in mind the following points regarding record ownership:

- A record can have many different owners during its life cycle.
- You can select an owner or owner group until the record's status is CLOSED.
- To view the ownership history of a record, select View History.
- A workflow or an escalation process may assign ownership, if appropriate.

If the Persons tab on your Select Owner dialog box displays a Person Group field and a Date field, then you can filter the list of persons by the values in these fields. For example, suppose the Person Group field and the Date fields are empty when you open the dialog box. You specify a person group and a date and time, and click Refresh. The system displays only the persons in the specified group who are available on the specified day and time.

---

## Activity statuses

The status of an activity indicates its position in the processing cycle. The status determines which actions can be performed on the activity. For example, if the activity is approved (APPR), then the tasks can start.

When you change the status of an activity, the status of any applicable child activity that uses the inherit status option also changes. If you change the status of global activities, the same status change is automatically applied to all globally related records. In addition, the status of an activity can be automatically changed. For example, after you assign an owner to an activity, the status of that activity automatically changes to queued.

A follow-up record can change the status of the originating activity, which results in automatic routing or notification of the status change.

### WAPPR

The activity is waiting for approval. WAPPR is the default status for records created in the Work Order Tracking, Changes, Releases, and Activities and Tasks applications.

### APPR

The activity is approved and the work can begin. Work plan items on an approved activity are reserved in inventory, and cost and rate data are recorded. Rates can be changed in the Inventory application, Labor application, or Tools application. If the rates are changed in any application, the work plan reflects the rates in effect when the activity was approved.

### WSCH

The activity is waiting to be scheduled. WSCH is the default status for records created in the Preventive Maintenance application.

#### WMATL

Materials must arrive before the work can be performed.

#### WPCOND

The work can be performed only when the condition of the plant is suitable. For example, certain work might require the shutdown of the plant.

#### INPRG

The work is in progress. INPRG is the default status for records created in the Quick Reporting application.

#### COMP

The physical work is completed. If you want to move or change an asset on an activity, the move or change occurs when the status is changed to complete.

#### CLOSE

The activity is finalized. Inventory reservations for items not used in the activity are removed and the activity is made into a history record.

#### CAN

The work is canceled. You cannot cancel an activity if the work has already been initiated or if actuals have already been reported. You can use this status when you want to delete an activity and deleting is not allowed.

---

## Measurement points

When you inspect an asset or a location, you can record and view the meter readings that correspond to measurement points in the job plan of the associated work order. You can also insert measurement points on an activity until the activity or task is closed.

The product copies the measurement point number to the job plan when there is a three-way match between the following items:

- The measurement point name on the job plan listed on the activity.
- The measurement point name on the asset or the location listed on the activity.
- A measurement point number for the measurement point name.

If you specify a measurement for a measurement point, the measurement and measurement date are added to the Measurements table. If you specify a measurement without a measurement point, the measurement data is saved with the activity.

You use the Observation field to record visual inspection data. You use the Inspector field to record the name of the person performing the inspection. You can edit these fields until the activity is closed. Once the activity is closed, you can add or modify operations by selecting the Edit History Activity action.

---

## Service level agreements

A service level agreement (SLA) typically is a written agreement that outlines the commitment between a service provider and its customers. A commitment is a service level that all parties have agreed to, such as asset reliability or availability.

The SLA describes one or more commitments and the escalation actions or notifications associated with each commitment. Escalation actions or notifications might be associated with an SLA to ensure that commitments are met. An escalation process can monitor all activities and send notifications or perform other activities to ensure that commitments are met.

The types of records to which service level agreements can be applied include tickets, such as service requests, and work-based records, such as work orders. Before you can apply an SLA to a record, the record must have a site defined.

A service level agreement can be associated with a record in several ways:

- An SLA might automatically be applied to a record from within a workflow or escalation process, or from another SLA.
- You can select an action to apply an SLA, which applies the best match automatically.
- You can view SLAs and select an action to select or clear the SLAs that you want to manually apply to the record.

When you apply a service level agreement to a record, the following events occur:

- The SLA Applied check box on the main tab of the record is selected to document the action.
- Any escalations that are associated with the SLA are activated.
- The Target Start, Target Finish, and Contact values for the record might be calculated automatically as follows:

Automatically calculated values
When an SLA is applied that includes a response commitment, the response commitment date populates the Target Start date field of the record.
When an SLA is applied that includes a resolution commitment, the resolution commitment date populates the Target Finish date field of the record.
When an SLA is applied that includes a contact commitment, the contact commitment date populates the Target Contact date field of the record.

---

## Record relationships

Relationships between records, such as tickets and work orders, help simplify record management. You can create record relationships manually, or relationships might be created automatically when you take certain actions.

The types of relationships that can exist between records include:

- Related relationship, which is an informal association of tickets that is used for informational purposes.

- Originator and Follow-up, which keep costs hierarchies separate while still creating a relationship between the tickets.
- Related to Global, which creates a relationship in which the tickets are related to a global issue, which affects many users.

## Related records

Using any ticket or work-based application, you can view similar records and relate tickets and work orders to the current record. A related relationship between records is an informal relationship that is for informational purposes only.

A related relationship does not affect status inheritance, affect workflow, or follow a set of business rules. Related relationships can be many-to-many, and do not represent record hierarchies. By relating records informally, you can navigate to related records, view related information for similar records, and view open tickets that are associated with a field. You can create an informal record relationship in the following ways:

- Use the Related Records tab of the application. This tab provides an easy way to create relationships and to view and navigate among informally related records.
- Use the Show Similar Tickets action in any ticket application. The similar ticket search results only include the service requests, incidents, and problems that have the same classification as the current ticket. Global records and history records are not included in the results. Your system administrator might add more restrictions to the search results.

## Originator and follow-up tickets and work orders

You can relate tickets and work orders to a record more directly when you create a follow-up record from the ticket using one of the Create actions on the ticket. The ticket you create the follow-up record from is the originator. A follow-up record can be a ticket or a work order. In some cases, a follow-up ticket or work order might be able to change the status of its originating ticket. An originating ticket cannot change the status of a follow-up work order, nor can a follow-up ticket change the status of the originator if there is more than one follow-up. These options are configured by the system administrator.

## Globally related tickets

A global ticket is an incident or problem relating to an issue that affects many users. You can relate tickets, including service requests, to a global ticket, which creates a RELATEDTOGLOBAL relationship. This relationship lets you manage the tickets by using the global ticket. When you change the status of the global ticket, the system changes the status of all globally related tickets.

If your administrator has set up automated notifications of status changes, the system changes the status of the tickets related to the global issue. For example, all the initial requestors reporting the same issue are notified of its resolution. On the global ticket, you can also view a list of related records and view the work and communication logs for all related records.

- [Deletion of record relationships](#)  
On the Related Records tab, you can delete the relationship between a change and any related work orders or tickets.
- [Global records](#)  
A global record is a ticket that is a root cause of other issues or that affects many users, such as computer network failures or flooding in a building. After you mark a record as global, you can relate multiple tickets and then manage all tickets using the global record.

## Costs on tickets and work orders

You can view the estimated and actual costs for a single work order or ticket, including costs for labor, material, tools, and services. You can also view total costs for the current record and all the records below it in its hierarchy.

When you view the costs of a ticket or work order, the data is displayed in two tables:

- The Totals table displays the costs for a single ticket or work order.
- The View Hierarchy Grand Totals table displays the costs for the current ticket or work order and all records under its hierarchy.

Each table presents the same information, which is shown in the following table.

Column	Explanation
Current Estimate	Displays read-only calculated values for the current totals from the Labor, Materials, Standard Services, and Tools tabs of the Plans tab for the ticket or work order.
Estimate at Approval	Is set to zero until the work order is approved, then the values are copied from the Current Estimate column and are read-only. If the work order status changes from approved to unapproved, then these fields are cleared. The estimated costs at approval are not affected by the change in status from in progress to completed or closed.
Actual	Displays the read-only values from the Labor (for approved labor only), Materials, and Tools tabs of the Actuals tab. If the status of the record changes from approved, then these fields are not cleared.

## Rolling up maintenance costs

After you close a work order that is associated with an asset, you can calculate your maintenance costs by rolling up costs that you incur for labor, materials, tools, and services to the top-level asset in the hierarchy that the asset belongs to.

Costs can be rolled up manually or automatically. By default, cost rollups are manual. If you want costs to be calculated and rolled up automatically when a work order is closed, you must set the `mxe.workorder.rollupMaintenanceCosts` system property to 1. After you configure the system property for automatic rollups, all subsequent costs that are associated with work orders are rolled up automatically. However, any unprocessed maintenance costs that existed before the configuration are not automatically rolled up. You must roll up any preexisting, unprocessed maintenance costs manually.

To calculate the maintenance cost of your assets, use the Roll Up Maintenance Costs action in the Assets application.

---

## Work plan removal

Under certain circumstances, you can remove a work plan from an activity by using the Remove Work Plan action.

When you remove a work plan, all information in the Resources tab, except for non-task children, is removed. Also, if the work plan has a job plan, the job plan identifier is removed.

If any task in the work plan cannot be removed based on the deletion rules for changes, you cannot use the Remove Work Plan action. You can still delete labor, material, services, and tools information, as well as any tasks that do meet the deletion rules.

---

## Deletion rules for activities

For auditing purposes, you cannot always delete activities. If you cannot delete a specific activity, you can stop all action on an activity by changing the status to canceled.

The activity and its children must meet the following criteria to be deleted:

- Have a status of waiting for approval
- Not have any transactions registered against it, except for status changes
- Not have any actuals reported against it
- Not have any labor assignments associated with it
- Not have been generated for a purchase order or receipt
- It must not have any failures reported against it.
- Not be in a workflow or have ever been in a workflow
- Not have any measurements or meter readings taken against it
- Cannot be or have follow-up work

To delete an activity, use the Delete > Activity action.

---

## Rules for modifying archived activities

Closed and canceled activities are archived, and become historical records. You might be able to add additional information to a historical record by using the Edit History Activity action.

When you modify an archived activity, the following rules apply:

- New costs that were incurred during the edit history must be added to the inventory cost, if it is defined as charge to store.
- You can add actual labor, but you cannot change approved transactions.
- You can add actual materials and actual tools, but you cannot change them.
- You can add or delete child records, whether or not the child records are tasks.
- You can attach documents.
- You cannot change planned labor, materials, and tools.
- You cannot change information in the following fields:
  - Asset.
  - Location.
  - GL Account.
  - Charge to Store.
  - Status.
  - Status Date

---

## Working with activities

Activities are created in the Incidents and Problems applications. Tasks are created as part of activities and other work orders. You can manage and modify activities and tasks in the Activities and Tasks application. For example, you can change the ownership or status of an activity or task.

- **[Planning activities and tasks](#)**  
After you associate a task with an activity, you can specify estimates for labor, craft, materials, services, and tools for each task on the activity or for the activity as a whole.
- **[Reporting actuals for activities and tasks](#)**  
As work progresses on an approved activity or task, you can report the actual labor hours, materials, services, and tools used.
- **[Applying service level agreements to records](#)**  
You can apply a service level agreement (SLA) to a record to define the agreement and formal commitments between a service provider and a customer. The agreement documents the service to be provided or received, the agreed upon service levels for the service, and the means of measuring or quantifying the level of service.
- **[Swapping assets](#)**  
You can swap assets associated with a work order. The swap action applies to the work order and all of the assets, locations, and configuration items on its

child work orders. The term "work order" can refer to a work order, change, release, or activity record.

- [Relating work orders or tickets to activities or to tasks](#)

You can link work orders and tickets to an activity or task. When you link a record to a work order, its relationship type is RELATED.

- [Classifying activity records](#)

To simplify the process of finding and managing activity records, you can classify the records. Categorizing an activity involves classifying it and adding and modifying attributes to further group the classification.

- [Setting up work process flows](#)

Work process flows use relationships between work orders and tasks to automate the flow of status changes. You set relationships between work orders and tasks so that when a task is completed, the next task in the flow can be initiated.

- [Changing the status of activities or tasks](#)

You can change the status of an activity to indicate the position of the activity as it moves toward completion.

---

## Planning activities and tasks

After you associate a task with an activity, you can specify estimates for labor, craft, materials, services, and tools for each task on the activity or for the activity as a whole.

- [Creating work plans](#)

A work plan describes the labor, materials, tools, services, and tasks you need to complete an activity or task. You can create a work plan manually.

- [Planning work for activities and tasks](#)

You use the Activities and Tasks application to insert, view, or edit planned labor information or planned craft information.

- [Creating tasks for activities](#)

You use the Activities and Task application to create additional tasks or to edit the existing tasks for an activity. After you create a task, you can plan its labor, materials, services, and tools.

---

## Creating work plans

A work plan describes the labor, materials, tools, services, and tasks you need to complete an activity or task. You can create a work plan manually.

### Procedure

---

1. In the Activities and Tasks application, display the record for which you want to create a plan.
2. Make one of the following selections:

Option	Description
<b>If the record is an activity</b>	Click the Plans tab.
<b>If the record is a task</b>	Click the Resources tab, then click the Plans sub tab.

3. Specify work plan data, such as tasks, labor, materials, tools, and services using the sub tabs.
4. Save the record.

- [Creating work plans using job plans](#)

A work plan describes the labor, materials, tools, services, and tasks you need to complete an activity. You can select a job plan, and modify it to your needs.

---

## Creating work plans using job plans

A work plan describes the labor, materials, tools, services, and tasks you need to complete an activity. You can select a job plan, and modify it to your needs.

### Procedure

---

1. In the Activities and Tasks application, display the record for which you want to create a work plan from a job plan.
2. Make one of the following selections:

Option	Description
<b>If the record is an activity</b>	Click the Plans tab.
<b>If the record is a task</b>	Click the Resources tab, then click the Plans sub tab.

3. In the Job Plan field, click Detail Menu and select an option to retrieve a value. When you associate a job plan with a work order, the product copies the labor, the materials, the services, and the tools to the work order plan. If the job plan has a default safety plan for the selected work asset, the product also copies the safety plan to the work order.
4. Optional: Edit the fields to modify any of the information. Changes you make to the work plan do not affect the original job plan.
5. Save the record.

---

## Planning work for activities and tasks

You use the Activities and Tasks application to insert, view, or edit planned labor information or planned craft information.

## Procedure

1. Display the activity or task for which you want to plan labor.
2. Make one of the following selections:

Option	Description
<b>If the record is an activity</b>	Click the Plans tab.
<b>If the record is a task</b>	Click the Resources tab, then click the Plans sub tab.

3. Enter the details of the planned work on the following subtabs:

Option	Description
<b>Labor</b>	Add hours for labor or select crafts.
<b>Materials</b>	Add materials, search catalogs, or add spare parts.
<b>Services</b>	Add services.
<b>Tools</b>	Add tools.

4. Save the record.

## Creating tasks for activities

You use the Activities and Task application to create additional tasks or to edit the existing tasks for an activity. After you create a task, you can plan its labor, materials, services, and tools.

## Procedure

1. Display the activity for which you want to create planned tasks.
2. In the Tasks table window on the Plans tab, click New Row.
3. Specify a unique value in the Task field.
4. To have the tasks performed in a specific order, enter the appropriate value in the Sequence field.
5. Type the amount of time needed to complete the task in the Estimated Duration field.
6. Use the Labor, Materials, Services, and Tools subtabs to plan for the task.
7. Save the activity.

## Reporting actuals for activities and tasks

As work progresses on an approved activity or task, you can report the actual labor hours, materials, services, and tools used.

## Procedure

1. Display the activity or task for which you want to report actuals.
2. Make one of the following selections:

Option	Description
<b>If the record is an activity</b>	Click the Plans tab.
<b>If the record is a task</b>	Click the Resources tab, then click the Plans sub tab.

3. Enter the details for the actuals on the following subtabs:

Option	Description
<b>Labor</b>	Report hours for labor, copy labor from the work plan, or select planned labor.
<b>Materials</b>	Select materials, select reserved items, and select spare parts.
<b>Services</b>	Select services or standard services.
<b>Tools</b>	Select tools, copy tool data from the work plan, or select tools that were issued.

4. Save the record.

## Applying service level agreements to records

You can apply a service level agreement (SLA) to a record to define the agreement and formal commitments between a service provider and a customer. The agreement documents the service to be provided or received, the agreed upon service levels for the service, and the means of measuring or quantifying the level of service.

## About this task

When you apply an service level agreement to work orders, the SLA is applied only to the work order, not to its tasks. If you want to apply a service level agreement to a task, you must display the task as the current record and then apply the SLA.

You can apply service level agreements to tickets and work orders.

## Procedure

---

1. Open an application and display the record that you want to update.
2. Select the Apply SLA action.
3. Click OK.

## Results

---

The SLA Applied check box on the main tab of the selected application is selected. The target start, target finish, and contact values are calculated for the selected record.

---

## Removing service level agreements from records

To maintain accurate records, it might be necessary to remove an invalid or erroneous service level agreement to disassociate it from the record.

## Procedure

---

1. Display the record for which you want to remove a service level agreement.
2. Select the Select/Deselect SLA action.
3. Click Mark Row for Delete for each service level agreement that you want to remove from the record.
4. Click OK.
5. Save the record.

---

## Swapping assets

You can swap assets associated with a work order. The swap action applies to the work order and all of the assets, locations, and configuration items on its child work orders. The term "work order" can refer to a work order, change, release, or activity record.

## Before you begin

---

You can execute the swap immediately, or you can save the swap as a plan. If you save the swap as a plan, the changes will apply when the status for the work order is COMP (Complete). When the status of a work order is COMP, you swap assets only using the Execute Now option. When you select Execute Now on any tab, the system executes the changes on all tabs.

When you duplicate a work order that has a planned swap to its assets or locations, the planned action does not get copied to the duplicate work order. Also, when you create a release, or change, or work order from a record using the Select Action menu option, the planned action is not copied to the follow-up record.

## Procedure

---

1. Select the Move/Swap/Modify action.
2. Click the Move/Swap tab.
3. Select the Is this an Asset Swap checkbox.
4. In the Swap Assets section, select the row for the asset you want to swap.
5. To move the asset to a parent or location, type a value in the appropriate field, or click Select Value to retrieve a value.
6. In the Replacement Asset field, specify an asset, or click Select Value to retrieve a value.
7. Perform one of the following actions:
  - To swap the assets immediately, click Execute Now.
  - To swap the assets when the status for the work order is COMP (Complete), click Save as Plan.

---

## Relating work orders or tickets to activities or to tasks

You can link work orders and tickets to an activity or task. When you link a record to a work order, its relationship type is RELATED.

## Procedure

---

1. In the Activities and Tasks application, display the record to which you want to add related records.
2. On the Related Records tab, perform either of the following actions:
  - To relate a work order to the current record, in the Related Work Orders table window, click Add Row.
  - To relate a ticket to the current record, in the Related Tickets table window, click Add Row.
3. Type or select a work order in the Work Order field, or specify a ticket in the Related Record Key field.
4. Optional: You can enter a class.
5. Save the activity.

- [Assigning a parent to a work order](#)

You can assign a parent to a work order and assign tasks to that parent. When you assign work order records to a parent, they become child work orders records of the parent record.

- [Removing relationships between records](#)  
You can remove the relationship between an activity or a task and its related work orders or tickets.

---

## Assigning a parent to a work order

You can assign a parent to a work order and assign tasks to that parent. When you assign work order records to a parent, they become child work orders records of the parent record.

### About this task

---

You cannot assign parent records to closed work order records. If the parent has a value in the Priority field, and the child or children work order records do not, the child or children work order records inherit the parent priority value.

### Procedure

---

1. Open an application and display the work order record that you want to update.
2. On the List tab, select the task that you want to update.
3. Select the Assign To New Parent action.
4. Select the work order record that you want as the new parent.  
The asset management system displays the parent work order number in the Parent WO field.
5. Click Save record.

---

## Removing relationships between records

You can remove the relationship between an activity or a task and its related work orders or tickets.

### Before you begin

---

You can remove the relationship between records only if the ticket or the work order has a type of RELATED.

### About this task

---

To delete relationships with work orders of other relationship types, such as FOLLOWUP or ORIGINATOR, delete the work order in any of the following applications:

- Work Order Tracking
- Activities and Tasks
- Changes
- Releases

To delete relationships with tickets of other relationship types, you must go to the tickets applications.

### Procedure

---

1. In the Activities and Tasks application, display the record with the related relationship that you want to delete.
2. On the Related Records tab, select the record in the Related Work Orders table window.
3. Click the Mark Row for Delete icon. You can mark more than one row.
4. Click Save Activity.

---

## Classifying activity records

To simplify the process of finding and managing activity records, you can classify the records. Categorizing an activity involves classifying it and adding and modifying attributes to further group the classification.

### About this task

---

For example, you might classify an activity as a notebook. The notebook classification might have the attributes of memory, speed, and disk space associated with it, which are copied to the record upon classification. As needed, you can add attributes such as operating system and power, change the attribute values, and remove attributes associated with the record.

### Procedure

---

1. In the Activities and Tasks application, display the activity record that you want to categorize.
2. Select a classification for the activity in one of the following ways:

Choice	Description
--------	-------------

Choice	Description
<b>Use the Classification field</b>	In the Classification field of the main application tab or on the Activities and Tasks tab, click Detail Menu and then select Classify to produce a classification hierarchy tree that you can drill down through and select a classification.
<b>Use the Class Description field</b>	In the Class Description field of the main application tab or on the Activities and Tasks tab, you can hasten the classification search as follows: <ul style="list-style-type: none"> <li>a. Click the Select Value icon next to the Class Description field and enter a keyword or a word string, such as <i>Operating System</i> into the Description field of the window. All classification values that contain the keyword or word string are retrieved.</li> <li>b. Click a value from the resulting list to select the classification.</li> </ul>

3. Optional: You can view the attributes that are associated with the selected classification in the Attributes table window. You can also add, delete, and change the values of the attributes in the row details.
4. Save the activity.  
The full classification path appears in the Classification field, where you can view all nodes of the classification.

## Setting up work process flows

Work process flows use relationships between work orders and tasks to automate the flow of status changes. You set relationships between work orders and tasks so that when a task is completed, the next task in the flow can be initiated.

### Before you begin

To set the process flow for individual tasks, you must select Under Flow Control at the header level for the work order.

### About this task

The best practice for consistently using the flow feature is to set up the process flow as a work template at the job plan level.

### Procedure

1. Open the work order.
  2. Select Under Flow Control.
  3. On the Plans tab, display the details for the task.
  4. In the Scheduling Information section, next to the Predecessors field, click the Detail Menu icon.
  5. Select the tasks that must be completed before this task is initiated.
  6. Save the work order.
- [Defining flow actions](#)  
A flow action is used in a work process flow to define certain actions that should occur while work is being done. Actions or action groups can be applied to any work order, task, or job plan task.
  - [Removing work process flow from work orders or job plans](#)  
You can remove work process flow for a work order, a job plan, or task records that have it defined. You can do this at the header level, which will remove it for all the associated tasks as well, or you can remove it at the task level.
  - [Suspending work process flows](#)  
You can suspend the work process flow for work order or task records that have it defined. For example, if you want to start a work order or task manually, you could suspend the flow control on that record. The flow remains suspended until you remove the suspension.
  - [Stopping workflow processes](#)  
You can stop a workflow process for a record. You use the Workflow Administration application to view and stop workflow processes.

## Defining flow actions

A flow action is used in a work process flow to define certain actions that should occur while work is being done. Actions or action groups can be applied to any work order, task, or job plan task.

### About this task

You can determine whether the action takes place automatically, or if the action only takes place when it is initiated manually. When automatic, the action takes place as soon as the work order or task status is changed to an in progress (INPRG) status value by work process flow. When manual, you must initiate the flow action by running the automation or processing scripts or placing an action button on the target application. Actions and action groups are defined in the Actions application.

### Procedure

1. In an application that supports flow action, display the record for which you want to define a flow action.
2. Perform one of the following actions:
  - For a work order, change, release, or job plan record, enter a value in the Flow Action field on the application tab.
  - For a work order or job plan task, enter a value in the Flow Action field in the Task table window. The Tasks table window is found on the main tab of the Job Plans application, or the Plans tab of the Work Order Tracking, Changes, and Releases applications.

The defined action runs when the work order or task status value is changed to INPRG.

3. Specify whether you want the flow action to be automatically run:

Option	Flow Action Assist
Automatically run the flow action	Cleared
Manually run the flow action	Selected

4. Click Save record.

---

## Removing work process flow from work orders or job plans

You can remove work process flow for a work order, a job plan, or task records that have it defined. You can do this at the header level, which will remove it for all the associated tasks as well, or you can remove it at the task level.

### About this task

If work process flow is removed at the header level, it will automatically be removed on individual tasks on the record. You cannot retain work process flow for a task that does not have it set at the header level.

### Procedure

1. In an application that supports flow action, display the record that you want to remove from work process flow.
2. On the main application tab, clear the Flow Controlled check box. The system removes the work order or the job plan, and all of its tasks from work process flow.
3. Click Save Record.

---

## Suspending work process flows

You can suspend the work process flow for work order or task records that have it defined. For example, if you want to start a work order or task manually, you could suspend the flow control on that record. The flow remains suspended until you remove the suspension.

### Before you begin

Removing the suspension restarts the flow. Any successor work orders or tasks with completed predecessors continue the process. Work orders and tasks without predecessors continue the process at the same time as the parent record. The last completed child under a parent rolls its completion up to the parent.

### Procedure

1. In an application that supports flow action, display the record on which you want to suspend flow control.
2. On the main application tab, at the header level, select the Suspend Flow Control check box. The system suspends the work process flow on the work order and on all of its tasks.
3. To retain flow control for individual tasks, display the tasks in the Tasks table window, and clear the Suspend Flow Control check box at the task level. Flow control remains in place at the task level. This action does not affect the suspension at the work order header level. You can find the Tasks table window on the Plans tab.
4. Click Save Record.

### Example

You generally suspend a set of tasks, often under the same parent. For example, you can delay the automatic starting of one whole phase of work until a certain condition has been met. You can also delay starting a phase of work to make changes to the tasks, such as inserting tasks, deleting tasks, and changing the precedence logic.

---

## Changing the status of activities or tasks

You can change the status of an activity to indicate the position of the activity as it moves toward completion.

### Procedure

1. In the Service Requests, in the Problems, or in Incidents application that corresponds to the type of record you are managing, display the record whose status you want to change.
2. Select the Change Status action.
3. In the New Status field, choose a status from the pull-down menu.
4. Click OK to change the status.

### What to do next

If you change a ticket to a RESOLVED status, and you are the designated owner of that ticket, you might want to stop the timer or otherwise report the time that you spent resolving the issue.

---

## Contracts module

You use the applications in the Contracts module to manage contracts for labor rates, purchases, leases, warranties, and software. You can create different types of contracts and define the rules that govern each type of contract.

You can adjust prices and payment schedules, associate service level agreements with contracts, and view the history of contracts and contract revisions. You also can create master contracts to associate multiple contracts for the same vendor. When you create a contract, you specify the properties, and terms and conditions of the contract, and you specify the assets, people, or licenses associated with it.

The default installation contains the following types of contracts:

### Blanket (volume) contract

An agreement that specifies a vendor, a total dollar amount, and valid dates for the agreement. Typically, a blanket contract is used to purchase services and/or materials at agreed upon prices and terms. You can create release purchase orders in the Purchase Orders application that reference the blanket contract. Blanket contracts are created in the Purchase Contracts application.

### Labor contract

A way to define the rates that will be paid for craft and skill combinations, and also rates to be paid to specific contract laborers. You can set up a labor rate contract to create invoices for all approved labor transactions within a specified time period, such as every month. Labor contracts are created in the Labor Rate Contracts application.

### Lease contract

An agreement to lease one or more assets from a vendor. Lease contracts specify lease period, payment schedules, and other conditions of the contract. Invoices can be generated based on the payment schedule intervals. This type of agreement may involve more than two parties, as one vendor may sell the assets and another may hold the lease. Lease contracts are created in the Lease/Rental Contracts application.

### Pricing contract

A price agreement contract specifies the prices to be paid for specific items purchased from a specific vendor. Typically, a price agreement is used to purchase services and/or materials at agreed upon prices and terms. Pricing contracts are created in the Purchase Contracts application.

### Purchase contract

Specifies the terms and conditions for a purchase. Purchase contracts are created in the Purchase Contracts application.

### Rental contract

Similar to a lease contract. Rental contracts specify the time period for the rental, payment schedules, and other conditions of the contract. Unlike a lease, a rental contract can be terminated at will, and does not include a buy-out option in the terms of the contract. Rental contracts are created in the Lease/Rental Contracts application.

### Service contract

Similar to a warranty, except that some of the items are billed on a per-incident basis. A service contract contains the details of the services to be provided, and if a payment schedule is associated with the contract. Service contracts are created in the Warranty Contracts application.

### Master contract

A way to associate many contract types together for the same vendor and define terms and conditions for the relationship with the vendor. A master contract lists all contracts that you have with a particular vendor. For example, a master contract might list rental contracts for tools or equipment, purchase contracts for materials, a labor rate contract, and a warranty on parts and labor. Master contracts are created in the Master Contracts application.

### Warranty contract

Created in conjunction with the purchase of an asset and generally has no costs associated with it. This contract contains the details of what is covered by the warranty. If a warranty contract is purchased, this is considered an extended warranty. Warranty contracts are created in the Warranty Contracts application.

### Software contract

An agreement in which you can specify the items or services provided, costs, shipping and handling, expected delivery times, financial terms, and vendor information for the software licenses that you have purchased.

Your system administrator can define an unlimited number of contract types using the Organizations application.

- [Purchase Contracts](#)  
You use the Purchase Contracts application to maintain purchase contracts with outside vendors. On the contract, you can specify items or services provided and their costs, shipping and handling, expected delivery times, financial terms, and vendor information.
- [Lease/Rental Contracts](#)  
You use the Lease/Rental Contracts application to define the overall terms and conditions of an agreement between a vendor and a customer that pertains to rotating assets. A rotating asset is an asset that is interchangeable, such as a motor, pump, or laptop computer.
- [Labor Rate Contracts](#)  
You use the Labor Rate Contracts application to specify labor rates for crafts, skills, and, labor. You also can manage outside labor and their rates.
- [Master Contracts](#)  
You use the Master Contracts application to associate different types of contracts for the same vendor. A master contract defines the vendor relationship that applies to the contracts associated with that vendor.
- [Warranty Contracts](#)  
In the Warranty Contracts application, you create warranty contracts. A warranty contract defines the agreement to maintain one or more assets with an outside service provider for a fee or a scheduled set of payments. The contract also tracks warranty information for assets and locations by time or meter.
- [Terms and Conditions](#)  
You use the Terms and Conditions application to specify and to maintain a library of terms and conditions. You can add the terms and conditions to a purchasing document or to a contract. Terms can contain information such as liability concerns, shipping and handling details, and delivery time expectations.

---

## Purchase Contracts

You use the Purchase Contracts application to maintain purchase contracts with outside vendors. On the contract, you can specify items or services provided and their costs, shipping and handling, expected delivery times, financial terms, and vendor information.

You can create the following types of purchase contracts:

- **Blanket contract** - A blanket contract is an agreement to spend a predetermined amount with the specified vendor over a period of time.
- **Price contract** - A price contract specifies that items or services purchased from the specified vendor over a period of time are provided at an agreed-upon price.
- **Purchase contract** - A purchase contract is an agreement to purchase items or services at an agreed-upon price with a vendor. To create this type of contract, you must have a purchase order that does not specify a maximum amount.

Before you can approve a purchase contract, you must have at least one authorized site.

- [Purchase contracts overview](#)  
You can maintain purchase contracts with outside vendors. On the contract, you can specify items or services provided and their costs, shipping and handling, expected delivery times, financial terms, and vendor information.
- [Creating purchase contracts](#)  
In the Purchase Contracts application, you can maintain purchase contracts with outside vendors. You can create purchase contracts, blanket contracts, and price contracts.

---

## Purchase contracts overview

You can maintain purchase contracts with outside vendors. On the contract, you can specify items or services provided and their costs, shipping and handling, expected delivery times, financial terms, and vendor information.

- [Blanket contracts](#)  
A blanket (volume) contract is an agreement to spend a predetermined amount with a specified vendor over a period of time. This type of contract can also list items or services that the vendor will provide.
- [Release costs for blanket contracts](#)  
In the Purchase Contracts application, you can view the release costs associated with a blanket contract. The summary includes all planned and committed costs against a blanket contract.
- [Price contracts](#)  
A price contract is a type of purchase contract. You use a price contract to specify that items or services purchased from a vendor over a period time are provided at an agreed-upon price.
- [Associated purchase contracts](#)  
You can use an approved master contract to create associated purchase contracts for the same vendor. The master contract contains vendor information and defines terms and conditions for transactions with the vendor. The associated contract contains the identifier of the master contract and the current revision number, if applicable.
- [Release purchase orders](#)  
In the Purchase Contracts application, you can create a release purchase order that has all the properties, information, and terms and conditions of an existing contract. The cost of each release purchase order is tracked against the maximum release amount listed on the contract.
- [Terms and conditions for purchase contracts](#)  
You can associate terms and conditions with a purchase contract. These terms can contain information such as liability concerns, shipping and handling details, or delivery time expectations.
- [Contract statuses](#)  
Contract records have a status to indicate where the record is in a contract life cycle. Because contract records have statuses, you can create Workflow processes for contracts to manage approvals, expirations, renewals, and so forth. When you create a new contract, the Status field is set to DRAFT.

---

## Blanket contracts

A blanket (volume) contract is an agreement to spend a predetermined amount with a specified vendor over a period of time. This type of contract can also list items or services that the vendor will provide.

---

## Release purchase orders

You can create release purchase orders from blanket contracts and track committed costs for all purchases that you make. You also can create release purchase orders from purchase requisitions for items or catalog services that reference a blanket contract. When you approve a release purchase order, verification is made that sufficient funds remain to cover the total cost of the purchase order.

---

## Commodity groups and codes

You can associate commodity groups and codes with blanket contracts to help categorize expenses. After you make these associations, you can report on contract use by commodity. You also can use commodity groups and codes to route contracts to the contract manager responsible for this commodity.

---

## Release costs for blanket contracts

In the Purchase Contracts application, you can view the release costs associated with a blanket contract. The summary includes all planned and committed costs against a blanket contract.

All costs are displayed in the contract's default currency. The values in the are calculated at the time that they are displayed.

---

## Price contracts

A price contract is a type of purchase contract. You use a price contract to specify that items or services purchased from a vendor over a period time are provided at an agreed-upon price.

The Purchase Contracts application refers to the price contract when you enter items or service items on a request for quotation, purchase requisition, or purchase order line.

---

## Associated purchase contracts

You can use an approved master contract to create associated purchase contracts for the same vendor. The master contract contains vendor information and defines terms and conditions for transactions with the vendor. The associated contract contains the identifier of the master contract and the current revision number, if applicable.

When you create an associated purchase contract from a master contract, the master contract's vendor information, service level agreements, and certain properties are copied to the associated purchase contract. In addition, the start date is copied from the master contract, which you can change to any date that is after the start date, but before the end date of the master contract.

You create the associated purchase contract in the Master Contracts application. You view and change the associated contract in the Purchase Contracts application.

---

## Release purchase orders

In the Purchase Contracts application, you can create a release purchase order that has all the properties, information, and terms and conditions of an existing contract. The cost of each release purchase order is tracked against the maximum release amount listed on the contract.

You use the Create Release PO action to create a release purchase order. The release purchase order is created with the purchase order identifier and description that you specified. You can also indicate default charge values for the lines that you add to the release purchase order.

---

## Blanket contracts

You can create release purchase orders from approved blanket contracts that meet the following conditions:

- The blanket contract's start and end date that include the current date.
- The blanket contract has the create release property selected.

---

## Terms and conditions for purchase contracts

You can associate terms and conditions with a purchase contract. These terms can contain information such as liability concerns, shipping and handling details, or delivery time expectations.

You create and maintain terms and conditions in the Terms and Conditions application. You also can create terms for a specific record. These terms remain with the record and do not become part of the library of information in the Terms and Conditions application.

---

## Contract statuses

Contract records have a status to indicate where the record is in a contract life cycle. Because contract records have statuses, you can create Workflow processes for contracts to manage approvals, expirations, renewals, and so forth. When you create a new contract, the Status field is set to DRAFT.

Contract records can have one the following status values:

Table 1. Contract statuses

Status	Description
APPR	The contract record is approved. From this status, you can change the record status to CAN, CLOSE, SUSPND, EXPIRED.
CAN	The contract record is canceled or terminated. You cannot modify a contract record that has this status value.
CLOSE	The contract record is closed and all its terms and conditions are met. You cannot modify a contract record that has this status value.
DRAFT	The contract is a draft. In this status you can edit everything according to the properties for this type of contract. From this status, you can change the record status to WAPPR, APPR, CLOSE or CAN.
EXPIRED	The contract record is expired. The end date for the contract has passed. You cannot modify a contract record that has this status value. You can change the status from expire to pending revision by revising the expired contract.
PNDREV	The contract is a revised version of an existing contract. This status is similar to the draft status, but you can only edit specified fields.

Status	Description
REVISED	The contract record is revised. A <b>REVISED</b> status value is assigned to a revised contract that you have approved. You cannot modify anything on this contract record or change its status.
SUSPND	The contract record is suspended. You cannot modify anything on the contract except to change its status to <b>APPR</b> , <b>CAN</b> , or <b>CLOSE</b> .
WAPPR	The contract record is waiting for approval. You can modify the record and change the status to <b>DRAFT</b> , <b>APPR</b> , <b>CLOSE</b> or <b>CAN</b> .
WSTART	The contract record is waiting to start. This status value is assigned to the record when its start date is set for the future. You can change the record status value to <b>APPR</b> .

## Creating purchase contracts

In the Purchase Contracts application, you can maintain purchase contracts with outside vendors. You can create purchase contracts, blanket contracts, and price contracts.

### Procedure

1. In the Purchase Contracts application, click New Purchase Contract.  
The status of the new contract is set to draft and the start date is set to the current date.
2. Specify one of the following types of contracts:

Option	Description
<b>Blanket contract</b>	To create an agreement to spend a predetermined amount with the vendor over a period of time.
<b>Price contract</b>	To create a contract that specifies that items or services purchased from the vendor over a period of time are provided at an agreed-upon price.
<b>Purchase contract</b>	To create an agreement to purchase items or services at an agreed-upon price with a vendor. To create this type of contract, you must have a purchase order without a specified maximum amount.

3. Specify the currency value.
4. Optional: If you are creating a blanket contract, specify the following values:

Option	Description
<b>Maximum Release Amount</b>	<ul style="list-style-type: none"> <li>• To set a spending limit on a blanket contract, specify a maximum amount when you create the blanket contract.</li> <li>• To set a spending limit for each release purchase order against the blanket contract, specify a maximum release amount.</li> </ul>

When the create release property is selected, you can specify or change information in the Maximum Release Amount field.

5. Optional: Provide additional detail and vendor information.

- [Adjusting prices on contracts](#)

You can apply a price adjustment to a contract record to change the prices of its line items. You can raise or lower prices based on a percentage value.

- [Creating payment schedules for purchase contracts](#)

A payment schedule is a series of scheduled payments for contract line items. You create a payment schedule at the line item level that are typically for high-value items.

- [Associating commodities with contracts](#)

You can associate commodity groups and codes to a contract record to add items for a sale or a purchase as part of the contract. Commodity groups and codes help you categorize and manage contracts and their items and products. You can search for contracts by commodity, report spending on a commodity, and track commodities supplied by specified vendors.

- [Associating service level agreements with contracts](#)

A service level agreement is a written agreement between a service provider and its customers that defines the formal commitments. The agreement documents the service to be provided or received, the agreed upon service levels for the service, and the means of measuring or quantifying the level of service.

- [Selecting sites for contract authorizations](#)

You can select multiple sites to authorize for a contract. You can perform this action from more than one application.

- [Authorizing sites with contracts](#)

You can authorize one or more sites on a contract so that they are available for use in the authorized sites. You can add sites from other organizations to the contract only when the applicable sites use the same company and item sets. You can also change vendor data when you add sites to a contract. For example, you can authorize a local vendor branch for each site.

- [Changing the status of a list of records](#)

You can change the status of multiple records in applications.

## Adjusting prices on contracts

You can apply a price adjustment to a contract record to change the prices of its line items. You can raise or lower prices based on a percentage value.

### About this task

In the Labor Rate Contracts application, price adjustments are made to entries for the rate schedule. You can make price adjustments to contracts with a status of draft, waiting for approval, or pending revision.

### Procedure

1. In a contract application, display the record that you want to update.
2. Select the Apply Price Adjustment action.
3. Select the line items that you want to update.
4. In the Adjustment field, enter a percentage value.
5. Click Apply.

The asset management system calculates values for the New Price and New Unit Cost fields. In the Labor Rate Contracts application, the asset management system calculates a value for the New Standard Rate field.

6. Click OK.

The asset management system copies the values to the Unit Cost and Line Cost fields in the Contract Lines table window of the contract. In the Labor Rate Contracts application, the asset management system copies the value to the Standard Rate field of the Rate Schedule table window of the contract.

7. Click Save Contract.

---

## Creating payment schedules for purchase contracts

A payment schedule is a series of scheduled payments for contract line items. You create a payment schedule at the line item level that are typically for high-value items.

---

### Before you begin

To create a payment schedule, the payment schedule property must be selected.

---

### About this task

You can create a payment schedule until the contract is approved.

---

### Procedure

1. In the Purchase Contracts application, select the contract that contains the line for which you want to create a payment schedule.
2. Click the Contract Lines tab to display the contract lines.
3. Select the contract line for which you want to create a payment schedule.
4. Click Payment Schedule.  
The Payment Schedule window opens.
5. In the Schedule Lines table window, click New Row.
6. Specify the following information:
  - a. Specify an action that causes the payment.
  - b. Optional: If you are not specifying a line cost value, specify this payment's percentage of the total payments.  
This value works with the line cost value; and the line cost is calculated if you specify a percentage and vice-versa. The total of all line percentages must add up to 100.
  - c. Optional: If you are not specifying a payment percent value, specify a line cost value.
  - d. Optional: In the Days Interval field, select the amount of time to elapse between the action and the payment.  
A zero in this field indicates that the payment is due at the time that the action occurs.
  - e. In the Target Invoice Status field, specify the status in which the invoice is created.
7. Click OK to create the schedule when the item is ordered.

---

### What to do next

After the item is ordered, you can view invoice information for the item in the Invoices table window of the Payment Schedule window.

---

## Associating commodities with contracts

You can associate commodity groups and codes to a contract record to add items for a sale or a purchase as part of the contract. Commodity groups and codes help you categorize and manage contracts and their items and products. You can search for contracts by commodity, report spending on a commodity, and track commodities supplied by specified vendors.

---

### About this task

You can associate or remove any commodities on a contract that has a waiting for approval (WAPPR) or draft (DRAFT) status.

---

### Procedure

1. In a contract application, display the record that you want to update.
2. Select the Associate Commodities action.
3. In the Commodity Groups table window, click Select Commodity Groups.
4. Choose the commodity groups by selecting the corresponding Commodity Group check boxes.
5. Click OK.  
The selected commodity groups are added in the Commodity Groups table window.
6. In the Commodity Codes for Commodity Group table window, click Select Commodity Codes.

7. Choose the commodity codes by selecting the corresponding Commodity Codes check boxes.
8. Click OK.  
The selected commodity codes are added in the Commodity Codes for Commodity Group table window.
9. Click OK to close the Associate Commodities window.

---

## Associating service level agreements with contracts

A service level agreement is a written agreement between a service provider and its customers that defines the formal commitments. The agreement documents the service to be provided or received, the agreed upon service levels for the service, and the means of measuring or quantifying the level of service.

---

### Procedure

1. In a contract application, display the contract record for which you want to select one or more service level agreements.
2. Select the Associate SLAs action.
3. Click Select SLAs.
4. Select one or more service level agreements to associate with the contract.
5. To select a service level agreement from the same organization that created the contract, select the Select Record check box. You can select more than one agreement. To cancel a selection, clear the check box. To select all agreements in the list, select the Select All check box next to the Agreements column.
6. Click OK. The service level agreements are copied to the Associate SLAs window.
7. Click OK.

---

## Selecting sites for contract authorizations

You can select multiple sites to authorize for a contract. You can perform this action from more than one application.

---

### Procedure

1. In a contract application, display the contract record for which you want to select sites.
2. Select the Authorize Sites action.
3. Click Select Sites.
4. Select one or more sites. To select a site, select the Select Record check box next to each site you want to add.
5. Click OK. The selected sites are copied to the Authorize Sites window.
6. Optional: Modify the default Bill To and Attention fields.
7. Click OK.

---

## Authorizing sites with contracts

You can authorize one or more sites on a contract so that they are available for use in the authorized sites. You can add sites from other organizations to the contract only when the applicable sites use the same company and item sets. You can also change vendor data when you add sites to a contract. For example, you can authorize a local vendor branch for each site.

---

### Before you begin

You must choose a vendor for the contract before you can authorize a site.

---

### About this task

You can authorize sites for contracts that have a status value of waiting for approval (WAPPR) or draft (DRAFT). You must assign one default vendor for each site.

If you change the value in the Vendor field after you authorize a site, the asset management system copies the new vendor information to the rows that have a default vendor value. The asset management system also deletes the rows that have no default vendor value.

---

### Procedure

1. In a contract application, display the contract record that you want to update.
2. Select the Authorize Sites action.
3. Perform one of the following actions:

Option	Description
Authorize an individual site	<ol style="list-style-type: none"><li>a. Click New Row.</li><li>b. In the Vendor field, enter a value.</li><li>c. In the Site field, enter a value.</li><li>d. <b>Authorize multiple sites</b>	<ol style="list-style-type: none"> <li>Click Select Sites.</li> <li>Select the appropriate sites.</li> <li>Click OK.</li> <li>Enter values in the Bill To and Attention fields.</li> <li>Click OK to authorize the sites.</li> </ol>

## Changing the status of a list of records

You can change the status of multiple records in applications.

### Procedure

1. In the Work Order application, on the List tab of an application, filter the records so that less than 200 records are displayed.
2. Scroll down the bottom of the screen and select the Select Records check box.  
The screen refreshes and each row now has a check box.
3. Select the check boxes for the work orders whose status you want to change.
4. Click the Change Status action and enter the information in the dialog box.
5. Click OK to close the Change Status window.

## Lease/Rental Contracts

You use the Lease/Rental Contracts application to define the overall terms and conditions of an agreement between a vendor and a customer that pertains to rotating assets. A rotating asset is an asset that is interchangeable, such as a motor, pump, or laptop computer.

Rotating assets have an asset number and an inventory item number. Using both of these numbers, you track the asset as it moves from an operating location to a storeroom and back to an operating location.

After the customer receives the assets, the Lease/Rental Contracts application provides the details of the individual costs per asset. Payment schedule details are generally consolidated and provided on a monthly or quarterly basis. The payment schedule details can include the following information:

- Total payment amount
- Total number of payments
- Lease rate factor
- Period payment amount
- Costs associated with each asset that was delivered during the specified time period

When you receive a new payment schedule, you can create a lease contract under the master agreement, add a payment to an existing lease contract, or create a lease contract under the existing master with one line of payment schedule details.

- [Lease and rental contracts overview](#)  
When working with contracts for rotating assets, you can change the contract status, create payment schedules, associate leases and contracts with master contracts, and create terms and conditions.
- [Working with lease and rental contracts](#)  
A lease or rental contract defines the terms and conditions of the agreement between the vendor and the customer. You can associate items with contracts, purchase leased assets, return leased assets, adjust prices, and create payment schedules.

## Lease and rental contracts overview

When working with contracts for rotating assets, you can change the contract status, create payment schedules, associate leases and contracts with master contracts, and create terms and conditions.

- [Contract statuses](#)  
Contract records have a status to indicate where the record is in a contract life cycle. Because contract records have statuses, you can create Workflow processes for contracts to manage approvals, expirations, renewals, and so forth. When you create a new contract, the Status field is set to DRAFT.
- [Payment schedules for lease and rental contracts](#)  
A payment schedule for a lease or rental contract is a series of scheduled payments for a leased or rented asset. You can schedule the payments to occur weekly, monthly, or on certain days or dates. When you create a payment schedule for an asset, invoice records are generated.
- [Associated lease and rental contracts](#)  
You can use an approved master contract to create associated lease or rental contracts for the same vendor. The master contract contains vendor information and defines terms and conditions for transactions with the vendor. The associated contract contains the identifier of the master contract and the current revision number, if applicable.
- [Terms and conditions for labor rate contracts](#)  
You can associate terms and conditions with a labor rate contract. These terms can contain information such as liability concerns, shipping and handling details, or delivery time expectations.
- [Contract revisions](#)  
You can revise a contract record to make changes to the contract that has a status value of `APPR` (approved). The Revise Contract action is available to contracts that do not have an existing revision and that has the status value of `APPR` (approved).

---

## Contract statuses

Contract records have a status to indicate where the record is in a contract life cycle. Because contract records have statuses, you can create Workflow processes for contracts to manage approvals, expirations, renewals, and so forth. When you create a new contract, the Status field is set to DRAFT.

Contract records can have one the following status values:

Table 1. Contract statuses

Status	Description
APPR	The contract record is approved. From this status, you can change the record status to CAN, CLOSE, SUSPND, EXPIRED.
CAN	The contract record is canceled or terminated. You cannot modify a contract record that has this status value.
CLOSE	The contract record is closed and all its terms and conditions are met. You cannot modify a contract record that has this status value.
DRAFT	The contract is a draft. In this status you can edit everything according to the properties for this type of contract. From this status, you can change the record status to WAPPR, APPR, CLOSE or CAN.
EXPIRED	The contract record is expired. The end date for the contract has passed. You cannot modify a contract record that has this status value. You can change the status from expire to pending revision by revising the expired contract.
PNDREV	The contract is a revised version of an existing contract. This status is similar to the draft status, but you can only edit specified fields.
REVISED	The contract record is revised. A REVISED status value is assigned to a revised contract that you have approved. You cannot modify anything on this contract record or change its status.
SUSPND	The contract record is suspended. You cannot modify anything on the contract except to change its status to APPR, CAN, or CLOSE.
WAPPR	The contract record is waiting for approval. You can modify the record and change the status to DRAFT, APPR, CLOSE or CAN.
WSTART	The contract record is waiting to start. This status value is assigned to the record when its start date is set for the future. You can change the record status value to APPR.

---

## Payment schedules for lease and rental contracts

A payment schedule for a lease or rental contract is a series of scheduled payments for a leased or rented asset. You can schedule the payments to occur weekly, monthly, or on certain days or dates. When you create a payment schedule for an asset, invoice records are generated.

When you create a lease or rental contract, you specify the vendor header information, terms and conditions, the term, total number of payments, lease rate factor, and payment period, as well as a list of rotating items that are going to be leased or rented from the vendor. This information is used on a payment schedule for assets on the contract. The payment schedule can occur weekly, on certain days, or the first day of every month.

When there is a receipt for an asset that is associated with a lease or rental contract, the contract manager can be notified about the receipt and that a payment schedule should be created for the asset.

---

## Associated lease and rental contracts

You can use an approved master contract to create associated lease or rental contracts for the same vendor. The master contract contains vendor information and defines terms and conditions for transactions with the vendor. The associated contract contains the identifier of the master contract and the current revision number, if applicable.

When you create an associated lease or rental contract from a master contract, the master contract's vendor information, service level agreements, and certain properties are copied to the associated lease or rental contract. In addition, the start date is copied from the master contract, which you can change to any date that is after the start date, but before the end date of the master contract.

You create the associated labor rate contract in the Master Contracts application. You view and change the associated contract in the Lease/Rental Contracts application.

---

## Terms and conditions for labor rate contracts

You can associate terms and conditions with a labor rate contract. These terms can contain information such as liability concerns, shipping and handling details, or delivery time expectations.

You create and maintain terms and conditions in the Terms and Conditions application. You also can create terms for a specific record. These terms remain with the record and do not become part of the library of information in the Terms and Conditions application.

---

## Contract revisions

You can revise a contract record to make changes to the contract that has a status value of APPR (approved). The Revise Contract action is available to contracts that do not have an existing revision and that has the status value of APPR (approved).

When you revise a contract, all the information from the original contract is duplicated. The information that is duplicated includes contract lines, terms and conditions, associated service level agreements, commodities, authorized sites, and the contract number.

The status value of a revised contract record is `PNDREV` (pending revision). When you update the revised contract record, you can change its status from `PNDREV` to `WAPPR` (waiting on approval) or `APPR`. If you change the revised contract record status to `APPR`, the status value of the predecessor record changes to `REVISED` (revised). A contract record with the status of `REVISED` cannot be edited or reopened.

The Revision field on a contract record specifies the number of times a contract has been revised. When you create a contract record, the revision value is set to zero. Each time you revise a contract, the revision value is set to the next sequential number.

## Example of contract revisions

Contract 333, revision 0, requires an extension. The new end date is six months later than the original end date.

Table 1. Original contract

Contract number	Revision number	Status
333	0	APPR

You can use the `Revise Contract` action to create contract 333, revision 1, with status `PNDREV`. The status of contract 333, revision 0 remains `APPR` and revision 0 is available for use.

Table 2. First contract revision

Contract number	Revision number	Status
333	0	APPR
333	1	PNDREV

You can edit the end date in revision 1 and change its status to `APPR`. The status of revision 0 changes to `REVISED` and revision 0 is no longer available for use.

Table 3. Second contract revision

Contract number	Revision number	Status
333	0	REVISED
333	1	APPR

## Working with lease and rental contracts

A lease or rental contract defines the terms and conditions of the agreement between the vendor and the customer. You can associate items with contracts, purchase leased assets, return leased assets, adjust prices, and create payment schedules.

- [Creating lease and rental contracts](#)  
You create a lease or rental contract to define the overall terms and conditions of an agreement between a vendor and a customer.
- [Revising contracts](#)  
You can create a revised version of a contract. You can also create multiple revisions of a contract.
- [Changing the status of a list of records](#)  
You can change the status of multiple records in applications.
- [Creating terms](#)  
You can create terms and conditions that can later be associated with a contract or purchasing record. Terms and conditions can contain information such as: liability concerns, shipping and handling details, and delivery time expectations.
- [Associating existing terms with records](#)  
You can associate terms and conditions with records to define the rules that your company and your vendors must follow on purchase order and contract transactions.
- [Purchasing leased assets](#)  
In the Lease/Rental Contracts application, you can purchase one or more leased assets that are associated with your contracts. The asset can be part of a payment stream.
- [Returning leased assets](#)  
In the Lease/Rental Contracts application, you can return one or more leased assets that are associated with your contracts.
- [Adjusting prices on contracts](#)  
You can apply a price adjustment to a contract record to change the prices of its line items. You can raise or lower prices based on a percentage value.
- [Creating payment schedules for lease and rental contracts](#)  
You use payment schedules to create a series of payments to be made on an asset. You can schedule the payments to occur weekly, monthly, or on certain days or dates.
- [Creating interim charges on lease and rental contracts](#)  
You can create an interim charge to synchronize an out-of-schedule payment with the contract payment schedule, usually at the beginning of a contract.

## Creating lease and rental contracts

You create a lease or rental contract to define the overall terms and conditions of an agreement between a vendor and a customer.

### Procedure

1. In the Lease/Rental Contracts application, click `New Lease/Rental Contract`.  
A lease/rental contract is created with a draft status and a start date set to the current date.
2. Optional: Change the contract identifier and provide a description for the contract.
3. Specify whether the type of contract is either lease or rental.
4. Optional: Specify contract dates, vendor information, and cost information.

5. Optional: Specify the following information:
- Click the Properties tab to specify property information.
  - Click the Contract Lines tab to associate rotating items.
  - Click the Terms and Conditions tab to define terms and conditions.
- Note: A lease/rental contract must be approved before you can associate assets with it.
6. Save your changes.

- **Authorizing sites with contracts**  
You can authorize one or more sites on a contract so that they are available for use in the authorized sites. You can add sites from other organizations to the contract only when the applicable sites use the same company and item sets. You can also change vendor data when you add sites to a contract. For example, you can authorize a local vendor branch for each site.
- **Associating commodities with contracts**  
You can associate commodity groups and codes to a contract record to add items for a sale or a purchase as part of the contract. Commodity groups and codes help you categorize and manage contracts and their items and products. You can search for contracts by commodity, report spending on a commodity, and track commodities supplied by specified vendors.
- **Associating service level agreements with contracts**  
A service level agreement is a written agreement between a service provider and its customers that defines the formal commitments. The agreement documents the service to be provided or received, the agreed upon service levels for the service, and the means of measuring or quantifying the level of service.
- **Adding rotating items to lease or rental contracts**  
In the Lease/Rental Contracts application, you can manage your lease and rental contracts by adding rotating items. A rotating item is an interchangeable inventory item, such as a computer.
- **Associating assets with leases and rental contracts**  
To manage your leases and rental contracts, you can associate the assets that are used with specific leases and rental contracts.
- **Associating locations with lease and rental contracts**  
You can associate more than one location with a lease or rental contract in the Lease/Rental Contracts application.

---

## Authorizing sites with contracts

You can authorize one or more sites on a contract so that they are available for use in the authorized sites. You can add sites from other organizations to the contract only when the applicable sites use the same company and item sets. You can also change vendor data when you add sites to a contract. For example, you can authorize a local vendor branch for each site.

---

### Before you begin

You must choose a vendor for the contract before you can authorize a site.

---

### About this task

You can authorize sites for contracts that have a status value of waiting for approval (WAPPR) or draft (DRAFT). You must assign one default vendor for each site.

If you change the value in the Vendor field after you authorize a site, the asset management system copies the new vendor information to the rows that have a default vendor value. The asset management system also deletes the rows that have no default vendor value.

---

### Procedure

1. In a contract application, display the contract record that you want to update.
2. Select the Authorize Sites action.
3. Perform one of the following actions:

Option	Description
Authorize an individual site	<ol style="list-style-type: none"><li>a. Click New Row.</li><li>b. In the Vendor field, enter a value.</li><li>c. In the Site field, enter a value.</li><li>d. Select the Default check box to specify whether you want the vendor to be the default vendor.</li><li>e. Enter values in the Bill To and Attention fields.</li><li>f. Click OK to authorize the site.</li></ol>
Authorize multiple sites	<ol style="list-style-type: none"><li>a. Click Select Sites.</li><li>b. Select the appropriate sites.</li><li>c. Click OK.</li><li>d. Enter values in the Bill To and Attention fields.</li><li>e. Click OK to authorize the sites.</li></ol>

---

## Associating commodities with contracts

You can associate commodity groups and codes to a contract record to add items for a sale or a purchase as part of the contract. Commodity groups and codes help you categorize and manage contracts and their items and products. You can search for contracts by commodity, report spending on a commodity, and track commodities supplied by specified vendors.

## About this task

---

You can associate or remove any commodities on a contract that has a waiting for approval (WAPPR) or draft (DRAFT) status.

## Procedure

---

1. In a contract application, display the record that you want to update.
2. Select the Associate Commodities action.
3. In the Commodity Groups table window, click Select Commodity Groups.
4. Choose the commodity groups by selecting the corresponding Commodity Group check boxes.
5. Click OK.  
The selected commodity groups are added in the Commodity Groups table window.
6. In the Commodity Codes for Commodity Group table window, click Select Commodity Codes.
7. Choose the commodity codes by selecting the corresponding Commodity Codes check boxes.
8. Click OK.  
The selected commodity codes are added in the Commodity Codes for Commodity Group table window.
9. Click OK to close the Associate Commodities window.

---

## Associating service level agreements with contracts

A service level agreement is a written agreement between a service provider and its customers that defines the formal commitments. The agreement documents the service to be provided or received, the agreed upon service levels for the service, and the means of measuring or quantifying the level of service.

## Procedure

---

1. In a contract application, display the contract record for which you want to select one or more service level agreements.
2. Select the Associate SLAs action.
3. Click Select SLAs.
4. Select one or more service level agreements to associate with the contract.
5. To select a service level agreement from the same organization that created the contract, select the Select Record check box. You can select more than one agreement. To cancel a selection, clear the check box. To select all agreements in the list, select the Select All check box next to the Agreements column.
6. Click OK. The service level agreements are copied to the Associate SLAs window.
7. Click OK.

---

## Adding rotating items to lease or rental contracts

In the Lease/Rental Contracts application, you can manage your lease and rental contracts by adding rotating items. A rotating item is an interchangeable inventory item, such as a computer.

## Before you begin

---

To add rotating items, the status of the contract must be approved.

## About this task

---

You can only add a rotating item once. When you reserve rotating items on a purchase order, the serialized assets are associated with the lease or rental contract on receipt.

## Procedure

---

1. In the Lease/Rental Contracts application, select the contract to which you want to add rotating items.
2. Click the Contract Lines tab.
3. Specify the item using one of these options:
  - Click New Row and specify a value in the Item field.
  - Click Vendor Items to choose from a list of items from the specified vendor.
4. Optional: Specify values for line cost, lease end, commodity group, and commodity coe.
5. Specify a value for order unit.
6. Optional: Specify values for manufacturer, catalog number, model, and delivery time.
7. Optional: Specify whether an inspection is required.
8. Save your changes.

---

## Associating assets with leases and rental contracts

To manage your leases and rental contracts, you can associate the assets that are used with specific leases and rental contracts.

## Before you begin

---

To associate assets with a lease or rental contract, the lease or contract must be approved.

## Procedure

---

1. In the Lease/Rental Contracts application, select the appropriate contract.
2. Click the Associated Assets tab.
3. Click Select More Assets.
4. In the Select Assets dialog box, select the assets that you want to associate.
5. Click OK.
6. Save your changes.

---

## Associating locations with lease and rental contracts

You can associate more than one location with a lease or rental contract in the Lease/Rental Contracts application.

## Before you begin

---

To associate locations with a contract, the contract must be in an approved status.

## Procedure

---

1. In the Lease/Rental Contracts application, select the contract with which you want to associate a location.
2. Select the Associated Assets tab.
3. Click Select Locations.
4. In the Select Locations dialog box, select the locations that you want to associate with this contract

## What to do next

---

When you associate a location with a lease or rental contract, the application automatically sets dates for that line in the Associated Assets table. The start date is the current date, but you can modify it to a future date. The end date is calculated by adding the term of the contract in months to the start date.

---

## Revising contracts

You can create a revised version of a contract. You can also create multiple revisions of a contract.

## Before you begin

---

A contract must have an Approved (APPR) status before you can revise it.

## About this task

---

The Revision field of the contract indicates the number of times a contract has been revised. When you insert a contract record, the revision number is zero. As you make revisions to the contract, the next consecutive number is inserted in the Revision field. This option is available in more than one application.

## Procedure

---

1. In a contract application, display the contract you want to revise.
2. Select the Revise Contract action.
3. Type a description.
4. Optional: Fill in additional fields as needed. An asterisk (\*) indicates a required field.
5. Click OK. A new version of the contract with a status of pending revision (PNDREV) is created. Note that the original version of the contract remains in the APPR (Approved) status and is still valid while you are completing the revision.
6. Make the required changes to the revised version of the contract.
7. Change the status of the revised contract to APPR (Approved) to make it active. This action also changes the status of the originating contract to REVISED.
8. Click Save Contract.

---

## Changing the status of a list of records

You can change the status of multiple records in applications.

## Procedure

---

1. In the Work Order application, on the List tab of an application, filter the records so that less than 200 records are displayed.
2. Scroll down the bottom of the screen and select the Select Records check box.  
The screen refreshes and each row now has a check box.
3. Select the check boxes for the work orders whose status you want to change.
4. Click the Change Status action and enter the information in the dialog box.
5. Click OK to close the Change Status window.

---

## Creating terms

You can create terms and conditions that can later be associated with a contract or purchasing record. Terms and conditions can contain information such as: liability concerns, shipping and handling details, and delivery time expectations.

## Before you begin

---

Terms and conditions can only be added to purchasing or contracts records set at statuses in progress or waiting on approval.

## Procedure

---

1. In a purchasing or contract application, display the record for which you want to create a term.
2. On the Terms and Conditions tab, click New Row.
3. Specify the sequence and term.
4. Optional: Select the Send to Vendor check box.
5. Save the record.

## What to do next

---

You can set default term and condition values according to site and contract type in the Organizations application. When you create a contract record in a contracts application, the contract inherits the default term and condition values that you assigned to the selected contract type in the Organizations application.

---

## Associating existing terms with records

You can associate terms and conditions with records to define the rules that your company and your vendors must follow on purchase order and contract transactions.

## About this task

---

The Terms and Conditions application maintains a library of terms and conditions with which you and your vendors must comply. You can select terms from this library to apply to contract and purchasing records.

## Procedure

---

1. In a purchasing or contract application, display the record for which you want to select a term.
2. On the Terms and Conditions tab, click Select Terms.
3. Select the Select Record check box next to each term that you want to associate with the record.
4. Click OK.
5. Optional: Select the term in the Terms and Conditions table window and select the Send to Vendor check box.
6. Save the record.

---

## Purchasing leased assets

In the Lease/Rental Contracts application, you can purchase one or more leased assets that are associated with your contracts. The asset can be part of a payment stream.

## Before you begin

---

To purchase the asset, the status of the lease contract must be approved.

## Procedure

---

1. In the Lease/Rental Contracts application, select the contract whose asset you want to purchase.
2. Select the End Lease > Purchase Asset action.

3. In the Purchase Assets dialog box, select PO or Invoice to specify the type of document to generate for final payment.
4. In the Target Status field, specify the status to apply to the generated purchase order or invoice.
5. To specify a purchase order number or invoice number, select one of the following options:
  - To manually assign a purchase order number or invoice number, specify the number in the Number field.
  - To generate a purchase order number or invoice number, click Autonumber.
6. Click Select Assets.
7. In the Select Assets dialog box, select the assets to purchase and click OK.
8. Click OK.
9. Save your changes.

---

## Returning leased assets

In the Lease/Rental Contracts application, you can return one or more leased assets that are associated with your contracts.

---

### Before you begin

To return the asset, the status of the lease contract must be approved.

---

### Procedure

1. In the Lease/Rental Contracts application, select the contract whose asset you want to return.
2. Select the End Lease > Return Asset action.
3. In the Return Assets dialog box, select one of the following options to specify a purchase order number or invoice number:
  - To manually assign a purchase order number or invoice number, specify the number in the Invoice Number field.
  - To generate a purchase order number or invoice number, click Autonumber.
4. In the Target Status field, select the status to apply to the invoice.
5. Click Select Assets.
6. In the Select Assets dialog box, select the assets to return and click OK.
7. Click OK.
8. Save your changes.

---

## Adjusting prices on contracts

You can apply a price adjustment to a contract record to change the prices of its line items. You can raise or lower prices based on a percentage value.

---

### About this task

In the Labor Rate Contracts application, price adjustments are made to entries for the rate schedule. You can make price adjustments to contracts with a status of draft, waiting for approval, or pending revision.

---

### Procedure

1. In a contract application, display the record that you want to update.
2. Select the Apply Price Adjustment action.
3. Select the line items that you want to update.
4. In the Adjustment field, enter a percentage value.
5. Click Apply.

The asset management system calculates values for the New Price and New Unit Cost fields. In the Labor Rate Contracts application, the asset management system calculates a value for the New Standard Rate field.
6. Click OK.

The asset management system copies the values to the Unit Cost and Line Cost fields in the Contract Lines table window of the contract. In the Labor Rate Contracts application, the asset management system copies the value to the Standard Rate field of the Rate Schedule table window of the contract.
7. Click Save Contract.

---

## Creating payment schedules for lease and rental contracts

You use payment schedules to create a series of payments to be made on an asset. You can schedule the payments to occur weekly, monthly, or on certain days or dates.

---

### Before you begin

The contract must be approved before you can create a payment schedule.

---

### About this task

The payment schedule option must be selected on the Properties tab.

## Procedure

---

1. In the Lease/Rental contracts application, select the contract for which you want to generate a payment schedule.
2. Select the Manage Payments action.  
The Payment Schedule dialog box opens.
3. On the Payments tab in the Schedule table window, click New Row.
4. Specify values for the target invoice status, the start date, and the general ledger debit account.
5. Optional: Specify additional schedule information.
6. In the Schedule Lines table window, click Select Assets.
7. Specify values for general debit account, periodic payment, and line cost.
8. Click Generate Payments to generate scheduled invoices with specified due dates for all assets listed.
9. Click OK.
10. Save your changes.

- [Revising payment schedules for leases and rental contracts](#)

A payment schedule is a series of payments to be made on a leased or rented asset on a schedule basis, such as weekly, monthly, or on certain days or dates. To reflect your changing business needs, you can revise a payment schedule for leased or rented assets.

---

## Revising payment schedules for leases and rental contracts

A payment schedule is a series of payments to be made on a leased or rented asset on a schedule basis, such as weekly, monthly, or on certain days or dates. To reflect your changing business needs, you can revise a payment schedule for leased or rented assets.

### Before you begin

---

To revise payment schedules, the status of the lease contract must be approved.

### About this task

---

When you generate scheduled invoices for the revised schedule, the system date is used as the start date.

## Procedure

---

1. In the Lease/Rental Contracts application, select the contract whose payment schedule you want to revise.
2. Select the Manage Payments action.
3. On the Payment tab in the Payment Schedule dialog box, select the schedule and revision that you want to revise.
4. Click Revise Schedule.  
When you revise a schedule, the remaining scheduled invoices are canceled.
5. Click OK.
6. Update fields as necessary.
7. Click Generate Payments.
8. Click OK.
9. Save your changes.

---

## Creating interim charges on lease and rental contracts

You can create an interim charge to synchronize an out-of-schedule payment with the contract payment schedule, usually at the beginning of a contract.

### Before you begin

---

Before you can create an interim charge on a lease or rental contract, the contract must be approved.

## Procedure

---

1. In the Lease/Rental Contracts application, select the contract for which you want to create an interim charge.
2. Select the Manage Payments action.
3. In the Payment Schedule dialog box, click New Row.
4. In the Interim Charge field, specify the amount that is due in this payment cycle to synchronize the payment schedule.
5. Click Generate Payments.  
The payments, including the interim charge, are generated.
6. Save your changes.

## Example

---

You leased or rented a car on the 10th day of the payment cycle and, therefore, you would not owe anything from the beginning of the payment cycle to the 10th day of the payment cycle. You are only responsible for payment from the 11th day until the end of the payment cycle. After making the interim charge payment, you are synchronized with the payment schedule.

---

## Labor Rate Contracts

You use the Labor Rate Contracts application to specify labor rates for crafts, skills, and, labor. You also can manage outside labor and their rates.

When you create a labor rate contract, a unique contract number is generated. You can append this number to differentiate the contract from other contracts. For example, if you have multiple sites and want to track contracts associated with them individually, you can append contract numbers from a site with an indicator such as a building number or site name.

When you reference craft records or skill records on a labor rate contract, you reference records that were created and maintained in the Crafts application, but you can apply individual rates in a labor rate contract. You also can associate individual labor records with a labor rate contract.

- [Labor rate contracts overview](#)  
You can create associated labor rate contracts for the same vendor, set contract statuses, and select terms and conditions for labor rate contracts.
- [Working with labor rate contracts](#)  
You can create labor rate contracts, create labor rate schedules, and create payment schedules for leased and rented assets. You can also associate labor and crafts with labor rate contracts, and can create terms.

---

## Labor rate contacts overview

You can create associated labor rate contracts for the same vendor, set contract statuses, and select terms and conditions for labor rate contracts.

- [Associated labor rate contracts](#)  
You can use an approved master contract to create associated labor rate contracts for the same vendor. The master contract contains vendor information and defines terms and conditions for transactions with the vendor. The associated contract contains the identifier of the master contract and the current revision number, if applicable.
- [Contract statuses](#)  
Contract records have a status to indicate where the record is in a contract life cycle. Because contract records have statuses, you can create Workflow processes for contracts to manage approvals, expirations, renewals, and so forth. When you create a new contract, the Status field is set to DRAFT.
- [Terms and conditions for labor rate contracts](#)  
You can associate terms and conditions with a labor rate contract. These terms can contain information such as liability concerns, shipping and handling details, or delivery time expectations.

---

## Associated labor rate contracts

You can use an approved master contract to create associated labor rate contracts for the same vendor. The master contract contains vendor information and defines terms and conditions for transactions with the vendor. The associated contract contains the identifier of the master contract and the current revision number, if applicable.

When you create an associated labor rate contract from a master contract, the master contract's vendor information, service level agreements, and certain properties are copied to the associated labor rate contract. In addition, the start date is copied from the master contract, which you can change to any date that is after the start date, but before the end date of the master contract.

You create the associated labor rate contract in the Master Contracts application. You view and change the associated contract in the Labor Rate Contracts application.

---

## Contract statuses

Contract records have a status to indicate where the record is in a contract life cycle. Because contract records have statuses, you can create Workflow processes for contracts to manage approvals, expirations, renewals, and so forth. When you create a new contract, the Status field is set to DRAFT.

Contract records can have one the following status values:

Table 1. Contract statuses

Status	Description
APPR	The contract record is approved. From this status, you can change the record status to CAN, CLOSE, SUSPND, EXPIRED.
CAN	The contract record is canceled or terminated. You cannot modify a contract record that has this status value.
CLOSE	The contract record is closed and all its terms and conditions are met. You cannot modify a contract record that has this status value.
DRAFT	The contract is a draft. In this status you can edit everything according to the properties for this type of contract. From this status, you can change the record status to WAPPR, APPR, CLOSE or CAN.
EXPIRED	The contract record is expired. The end date for the contract has passed. You cannot modify a contract record that has this status value. You can change the status from expire to pending revision by revising the expired contract.
PNDREV	The contract is a revised version of an existing contract. This status is similar to the draft status, but you can only edit specified fields.

Status	Description
REVISED	The contract record is revised. A <b>REVISED</b> status value is assigned to a revised contract that you have approved. You cannot modify anything on this contract record or change its status.
SUSPND	The contract record is suspended. You cannot modify anything on the contract except to change its status to <b>APPR</b> , <b>CAN</b> , or <b>CLOSE</b> .
WAPPR	The contract record is waiting for approval. You can modify the record and change the status to <b>DRAFT</b> , <b>APPR</b> , <b>CLOSE</b> or <b>CAN</b> .
WSTART	The contract record is waiting to start. This status value is assigned to the record when its start date is set for the future. You can change the record status value to <b>APPR</b> .

## Terms and conditions for labor rate contracts

You can associate terms and conditions with a labor rate contract. These terms can contain information such as liability concerns, shipping and handling details, or delivery time expectations.

You create and maintain terms and conditions in the Terms and Conditions application. You also can create terms for a specific record. These terms remain with the record and do not become part of the library of information in the Terms and Conditions application.

## Working with labor rate contracts

You can create labor rate contracts, create labor rate schedules, and create payment schedules for leased and rented assets. You can also associate labor and crafts with labor rate contracts, and can create terms.

- [Creating labor rate contracts](#)  
When you create a labor rate contract, you can specify labor rates for crafts, skills, and, labor. You also can manage outside labor and their rates.
- [Creating labor rate schedules](#)  
In the Labor Rate Contracts application, you create labor rate schedules to manage the crafts and skills of the people in a vendor contract. You also retain the information associated with a labor rate contract, and reference the rates when specific crafts, skills, or individual laborers are planned for work.
- [Creating payment schedules for leased and rented assets](#)  
A payment schedule is a series of scheduled payments to be made on a leased or rented asset. You can schedule payments to occur weekly, monthly, or on certain days or dates.
- [Associating labor with labor rate contracts](#)  
To manage labor that you use in your organization, you can associate labor with labor rate contracts.
- [Creating terms](#)  
You can create terms and conditions that can later be associated with a contract or purchasing record. Terms and conditions can contain information such as: liability concerns, shipping and handling details, and delivery time expectations.
- [Applying service level agreements to records](#)  
You can apply a service level agreement (SLA) to a record to define the agreement and formal commitments between a service provider and a customer. The agreement documents the service to be provided or received, the agreed upon service levels for the service, and the means of measuring or quantifying the level of service.
- [Adjusting prices on contracts](#)  
You can apply a price adjustment to a contract record to change the prices of its line items. You can raise or lower prices based on a percentage value.
- [Revising contracts](#)  
You can create a revised version of a contract. You can also create multiple revisions of a contract.

## Creating labor rate contracts

When you create a labor rate contract, you can specify labor rates for crafts, skills, and, labor. You also can manage outside labor and their rates.

### Procedure

1. In the Labor Rate Contracts application, click New Labor Rate Contract.  
A unique contract number is generated, the status is set to draft, and the date is set to the current date.
2. Optional: Provide a description for the labor rate contract.
3. Provide additional information for the labor rate contract.
4. Save the contract.

### What to do next

You can append the contract number to differentiate the contract from other contracts. For example, if you want to individually track contracts that are associated with multiple sites, you append contract numbers from a site with an indicator, such as a building number or site name.

## Creating labor rate schedules

In the Labor Rate Contracts application, you create labor rate schedules to manage the crafts and skills of the people in a vendor contract. You also retain the information associated with a labor rate contract, and reference the rates when specific crafts, skills, or individual laborers are planned for work.

## About this task

---

You manage craft records and skill records in the Crafts application.

## Procedure

---

1. In the Labor Rate Contracts application, select the contract for which you want to create a labor rate schedule.
2. Click the Rate Schedule tab.
3. To create a labor rate schedule, complete one of these steps:
  - Click Select Crafts to specify a value for the craft.
  - Click New Row to add a craft.
4. Specify the standard pay rate for the craft and skill.
5. Save your changes.

---

## Creating payment schedules for leased and rented assets

A payment schedule is a series of scheduled payments to be made on a leased or rented asset. You can schedule payments to occur weekly, monthly, or on certain days or dates.

## Before you begin

---

To create a payment schedule for a contract, the contract must be approved. Before you can approve the contract, you must specify the lease rate factor, term in months, payment period, and number of payments on the Contract tab in the Lease/Rental Contracts application. In addition, you must select the Payment Schedule check box on the Properties tab.

## Procedure

---

1. In the Lease/Rental Contracts application, select the contract for which you want to create a payment schedule.
  2. Select the Manage Payments action.
  3. In the Payment Schedule dialog box, click New Row.
  4. Specify or change the values for target invoice status, start date, and the general ledger debit account.
  5. Click Select Assets.
  6. Select the assets for the payment schedule.  
Periodic payment for each asset that you selected are generated. In addition, you can change the following information for each asset: general ledger debit account, periodic payment, line cost, and tax code.
  7. Click Generate Payments to generate scheduled invoices with specified due dates for all assets listed.
  8. On the Payment Details tab, review the scheduled invoices.
- [Viewing payment schedules for leases and rental contracts](#)  
To manage your payment schedules, you can view payment details associated with a leases or rental contracts.

---

## Viewing payment schedules for leases and rental contracts

To manage your payment schedules, you can view payment details associated with a leases or rental contracts.

## Procedure

---

1. In the Lease/Rental Contracts application, select the contract for which you want to view a payment schedule.
2. Select the Manage Payments action.
3. Click the Payment Details tab.

---

## Associating labor with labor rate contracts

To manage labor that you use in your organization, you can associate labor with labor rate contracts.

## About this task

---

To associate labor with a labor rate contract, the contract must have a status of approved. You can select only craft and skill combinations that are defined on the rate schedule.

## Procedure

---

1. In the Labor Rate Contracts application, select the contract for which you want to associate labor.
2. Click the Associated Labor tab.

3. Click Select Labor.
4. Select the labor that you want to associate with the contract.  
You can select more than one labor.
5. Click OK.
6. Save your changes.

---

## What to do next

After you associate labor with the contract, you can specify crafts and skill levels.

- [Associating crafts with labor rate contracts](#)  
You can associate crafts and their skill levels with labor rate contracts.

---

## Associating crafts with labor rate contracts

You can associate crafts and their skill levels with labor rate contracts.

---

## About this task

You can associate crafts with labor rate contracts that are in a status of draft, pending revision, or waiting for approval.

---

## Procedure

1. In the Labor Rate Contracts application, select the contract for which you want to associate a craft.
2. Click the Rate Schedule tab.
3. In the Rate Schedule table window, click Select Crafts.
4. Select the crafts that you want associated with the contract.  
You can select more than one craft.
5. Click OK.
6. Save your changes.

---

## Creating terms

You can create terms and conditions that can later be associated with a contract or purchasing record. Terms and conditions can contain information such as: liability concerns, shipping and handling details, and delivery time expectations.

---

## Before you begin

Terms and conditions can only be added to purchasing or contracts records set at statuses in progress or waiting on approval.

---

## Procedure

1. In a purchasing or contract application, display the record for which you want to create a term.
2. On the Terms and Conditions tab, click New Row.
3. Specify the sequence and term.
4. Optional: Select the Send to Vendor check box.
5. Save the record.

---

## What to do next

You can set default term and condition values according to site and contract type in the Organizations application. When you create a contract record in a contracts application, the contract inherits the default term and condition values that you assigned to the selected contract type in the Organizations application.

---

## Applying service level agreements to records

You can apply a service level agreement (SLA) to a record to define the agreement and formal commitments between a service provider and a customer. The agreement documents the service to be provided or received, the agreed upon service levels for the service, and the means of measuring or quantifying the level of service.

---

## About this task

When you apply an service level agreement to work orders, the SLA is applied only to the work order, not to its tasks. If you want to apply a service level agreement to a task, you must display the task as the current record and then apply the SLA.

You can apply service level agreements to tickets and work orders.

---

## Procedure

1. Open an application and display the record that you want to update.
2. Select the Apply SLA action.
3. Click OK.

---

## Results

The SLA Applied check box on the main tab of the selected application is selected. The target start, target finish, and contact values are calculated for the selected record.

---

## Adjusting prices on contracts

You can apply a price adjustment to a contract record to change the prices of its line items. You can raise or lower prices based on a percentage value.

---

## About this task

In the Labor Rate Contracts application, price adjustments are made to entries for the rate schedule. You can make price adjustments to contracts with a status of draft, waiting for approval, or pending revision.

---

## Procedure

1. In a contract application, display the record that you want to update.
2. Select the Apply Price Adjustment action.
3. Select the line items that you want to update.
4. In the Adjustment field, enter a percentage value.
5. Click Apply.  
The asset management system calculates values for the New Price and New Unit Cost fields. In the Labor Rate Contracts application, the asset management system calculates a value for the New Standard Rate field.
6. Click OK.  
The asset management system copies the values to the Unit Cost and Line Cost fields in the Contract Lines table window of the contract. In the Labor Rate Contracts application, the asset management system copies the value to the Standard Rate field of the Rate Schedule table window of the contract.
7. Click Save Contract.

---

## Revising contracts

You can create a revised version of a contract. You can also create multiple revisions of a contract.

---

## Before you begin

A contract must have an Approved (APPR) status before you can revise it.

---

## About this task

The Revision field of the contract indicates the number of times a contract has been revised. When you insert a contract record, the revision number is zero. As you make revisions to the contract, the next consecutive number is inserted in the Revision field. This option is available in more than one application.

---

## Procedure

1. In a contract application, display the contract you want to revise.
2. Select the Revise Contract action.
3. Type a description.
4. Optional: Fill in additional fields as needed. An asterisk (\*) indicates a required field.
5. Click OK. A new version of the contract with a status of pending revision (PNDREV) is created. Note that the original version of the contract remains in the APPR (Approved) status and is still valid while you are completing the revision.
6. Make the required changes to the revised version of the contract.
7. Change the status of the revised contract to APPR (Approved) to make it active. This action also changes the status of the originating contract to REVISED.
8. Click Save Contract.

---

## Master Contracts

You use the Master Contracts application to associate different types of contracts for the same vendor. A master contract defines the vendor relationship that applies to the contracts associated with that vendor.

In the Master Contracts application, you can manage vendor contracts, list properties that are associated with the contract, list the children contracts that are linked or associated to a master contract, and associate terms and conditions with a contract.

Master contracts can have one or more associated contracts and can contain multiples of a particular type of contract.

- [Master contracts overview](#)  
You can change the status of a master contract, associate terms and conditions for a master contract, associate contracts with a master contract, and create copies of a master contract.
- [Working with master contracts](#)  
You can create master contracts, revise contracts, change the statuses of contracts, authorize sites, associate service level agreements, and create terms and conditions.

---

## Master contracts overview

You can change the status of a master contract, associate terms and conditions for a master contract, associate contracts with a master contract, and create copies of a master contract.

- [Contract statuses](#)  
Contract records have a status to indicate where the record is in a contract life cycle. Because contract records have statuses, you can create Workflow processes for contracts to manage approvals, expirations, renewals, and so forth. When you create a new contract, the Status field is set to DRAFT.
- [Associated contracts](#)  
In the Master Contracts application, you can create associated contracts for an approved master contract. Master contracts can have one or more associated contracts, and can contain several contracts of a particular type.
- [Terms and conditions for master contracts](#)  
You can associate terms and conditions with a master contract. These terms can contain information such as liability concerns, shipping and handling details, or delivery time expectations.
- [Copies of master contracts](#)  
You can copy an existing master contract, and use the copy as a template for a new master contract.

---

## Contract statuses

Contract records have a status to indicate where the record is in a contract life cycle. Because contract records have statuses, you can create Workflow processes for contracts to manage approvals, expirations, renewals, and so forth. When you create a new contract, the Status field is set to DRAFT.

Contract records can have one the following status values:

Table 1. Contract statuses

Status	Description
APPR	The contract record is approved. From this status, you can change the record status to CAN, CLOSE, SUSPND, EXPIRED.
CAN	The contract record is canceled or terminated. You cannot modify a contract record that has this status value.
CLOSE	The contract record is closed and all its terms and conditions are met. You cannot modify a contract record that has this status value.
DRAFT	The contract is a draft. In this status you can edit everything according to the properties for this type of contract. From this status, you can change the record status to WAPPR, APPR, CLOSE or CAN.
EXPIRED	The contract record is expired. The end date for the contract has passed. You cannot modify a contract record that has this status value. You can change the status from expire to pending revision by revising the expired contract.
PNDREV	The contract is a revised version of an existing contract. This status is similar to the draft status, but you can only edit specified fields.
REVISED	The contract record is revised. A REVISED status value is assigned to a revised contract that you have approved. You cannot modify anything on this contract record or change its status.
SUSPND	The contract record is suspended. You cannot modify anything on the contract except to change its status to APPR, CAN, or CLOSE.
WAPPR	The contract record is waiting for approval. You can modify the record and change the status to DRAFT, APPR, CLOSE or CAN.
WSTART	The contract record is waiting to start. This status value is assigned to the record when its start date is set for the future. You can change the record status value to APPR.

---

## Associated contracts

In the Master Contracts application, you can create associated contracts for an approved master contract. Master contracts can have one or more associated contracts, and can contain several contracts of a particular type.

Terms and conditions are not copied to associated contracts. However, when a purchase order references an associated contract, the terms and conditions from the associated contract and master contract are copied to the purchase order.

In the Warranty Contracts application, you can change the start and end dates, authorized sites, commodities, properties for extendable, extension period, and conditions for extension.

---

## Creating associated contracts

In the Master Contracts application, you use the Create Associated Contract action to create an associated contract. When you create an associated contract, the following information is copied from the master contract:

- Identifier and revision number
- Vendor information
- Associated service level agreements
- Properties for extendable, extension period, conditions for extension
- Start and end dates
- Authorized sites
- Commodities

---

## Viewing associated contracts

In the Master Contracts application, you view associated contracts on the Associated Contracts tab. When you view associated contracts, all contracts that are associated with the master, regardless of the revision of the master contract that you are viewing, are displayed.

---

## Terms and conditions for master contracts

You can associate terms and conditions with a master contract. These terms can contain information such as liability concerns, shipping and handling details, or delivery time expectations.

You create and maintain terms and conditions in the Terms and Conditions application. You also can create terms for a specific record. These terms remain with the record and do not become part of the library of information in the Terms and Conditions application.

---

## Copies of master contracts

You can copy an existing master contract, and use the copy as a template for a new master contract.

When you duplicate a contract, all related information is copied, including authorized sites, commodities, service level agreement information, and terms and conditions.

When you copy a master contract, associated contracts are not copied.

---

## Working with master contracts

You can create master contracts, revise contracts, change the statuses of contracts, authorize sites, associate service level agreements, and create terms and conditions.

- [Creating master contracts](#)  
A master contract defines the relationship with a vendor, and contains terms and conditions that apply to associated contracts. You create a master contract in the Master Contracts application.
- [Revising contracts](#)  
You can create a revised version of a contract. You can also create multiple revisions of a contract.
- [Changing the status of a list of records](#)  
You can change the status of multiple records in applications.
- [Authorizing sites with contracts](#)  
You can authorize one or more sites on a contract so that they are available for use in the authorized sites. You can add sites from other organizations to the contract only when the applicable sites use the same company and item sets. You can also change vendor data when you add sites to a contract. For example, you can authorize a local vendor branch for each site.
- [Associating service level agreements with contracts](#)  
A service level agreement is a written agreement between a service provider and its customers that defines the formal commitments. The agreement documents the service to be provided or received, the agreed upon service levels for the service, and the means of measuring or quantifying the level of service.
- [Creating terms](#)  
You can create terms and conditions that can later be associated with a contract or purchasing record. Terms and conditions can contain information such as: liability concerns, shipping and handling details, and delivery time expectations.
- [Associating existing terms with records](#)  
You can associate terms and conditions with records to define the rules that your company and your vendors must follow on purchase order and contract transactions.

---

## Creating master contracts

A master contract defines the relationship with a vendor, and contains terms and conditions that apply to associated contracts. You create a master contract in the Master Contracts application.

## Procedure

---

1. In the Master Contracts application, click New Master Contract.  
The new contract is displayed with a draft status, a start date set to the current date, and the contract type set to master.
2. Optional: Specify values for the vendor reference number, buyer, start date, end date, renewal date, and total cost.  
You can change the total cost until the contract is approved.
3. Specify the currency for the contract.
4. Optional: In the Vendor table window, provide information for the vendor.
5. Save the master contract.

## What to do next

---

When you create a master contract, the contract is given a unique contract number. You can append this number to further differentiate this contract from other contracts. For example, if you have multiple sites and want to track contracts by site, you can append contract numbers from a site with indicators, such as building numbers or site names.

## Revising contracts

---

You can create a revised version of a contract. You can also create multiple revisions of a contract.

### Before you begin

---

A contract must have an Approved (APPR) status before you can revise it.

### About this task

---

The Revision field of the contract indicates the number of times a contract has been revised. When you insert a contract record, the revision number is zero. As you make revisions to the contract, the next consecutive number is inserted in the Revision field. This option is available in more than one application.

## Procedure

---

1. In a contract application, display the contract you want to revise.
2. Select the Revise Contract action.
3. Type a description.
4. Optional: Fill in additional fields as needed. An asterisk (\*) indicates a required field.
5. Click OK. A new version of the contract with a status of pending revision (PNDREV) is created. Note that the original version of the contract remains in the APPR (Approved) status and is still valid while you are completing the revision.
6. Make the required changes to the revised version of the contract.
7. Change the status of the revised contract to APPR (Approved) to make it active. This action also changes the status of the originating contract to REVISED.
8. Click Save Contract.

## Changing the status of a list of records

---

You can change the status of multiple records in applications.

## Procedure

---

1. In the Work Order application, on the List tab of an application, filter the records so that less than 200 records are displayed.
2. Scroll down the bottom of the screen and select the Select Records check box.  
The screen refreshes and each row now has a check box.
3. Select the check boxes for the work orders whose status you want to change.
4. Click the Change Status action and enter the information in the dialog box.
5. Click OK to close the Change Status window.

## Authorizing sites with contracts

---

You can authorize one or more sites on a contract so that they are available for use in the authorized sites. You can add sites from other organizations to the contract only when the applicable sites use the same company and item sets. You can also change vendor data when you add sites to a contract. For example, you can authorize a local vendor branch for each site.

### Before you begin

---

You must choose a vendor for the contract before you can authorize a site.

## About this task

You can authorize sites for contracts that have a status value of waiting for approval (WAPPR) or draft (DRAFT). You must assign one default vendor for each site.

If you change the value in the Vendor field after you authorize a site, the asset management system copies the new vendor information to the rows that have a default vendor value. The asset management system also deletes the rows that have no default vendor value.

## Procedure

1. In a contract application, display the contract record that you want to update.
2. Select the Authorize Sites action.
3. Perform one of the following actions:

Option	Description
<b>Authorize an individual site</b>	<ol style="list-style-type: none"><li>a. Click New Row.</li><li>b. In the Vendor field, enter a value.</li><li>c. In the Site field, enter a value.</li><li>d. Select the Default check box to specify whether you want the vendor to be the default vendor.</li><li>e. Enter values in the Bill To and Attention fields.</li><li>f. Click OK to authorize the site.</li></ol>
<b>Authorize multiple sites</b>	<ol style="list-style-type: none"><li>a. Click Select Sites.</li><li>b. Select the appropriate sites.</li><li>c. Click OK.</li><li>d. Enter values in the Bill To and Attention fields.</li><li>e. Click OK to authorize the sites.</li></ol>

## Associating service level agreements with contracts

A service level agreement is a written agreement between a service provider and its customers that defines the formal commitments. The agreement documents the service to be provided or received, the agreed upon service levels for the service, and the means of measuring or quantifying the level of service.

## Procedure

1. In a contract application, display the contract record for which you want to select one or more service level agreements.
2. Select the Associate SLAs action.
3. Click Select SLAs.
4. Select one or more service level agreements to associate with the contract.
5. To select a service level agreement from the same organization that created the contract, select the Select Record check box. You can select more than one agreement. To cancel a selection, clear the check box. To select all agreements in the list, select the Select All check box next to the Agreements column.
6. Click OK. The service level agreements are copied to the Associate SLAs window.
7. Click OK.

## Creating terms

You can create terms and conditions that can later be associated with a contract or purchasing record. Terms and conditions can contain information such as: liability concerns, shipping and handling details, and delivery time expectations.

## Before you begin

Terms and conditions can only be added to purchasing or contracts records set at statuses in progress or waiting on approval.

## Procedure

1. In a purchasing or contract application, display the record for which you want to create a term.
2. On the Terms and Conditions tab, click New Row.
3. Specify the sequence and term.
4. Optional: Select the Send to Vendor check box.
5. Save the record.

## What to do next

You can set default term and condition values according to site and contract type in the Organizations application. When you create a contract record in a contracts application, the contract inherits the default term and condition values that you assigned to the selected contract type in the Organizations application.

## Associating existing terms with records

You can associate terms and conditions with records to define the rules that your company and your vendors must follow on purchase order and contract transactions.

## About this task

---

The Terms and Conditions application maintains a library of terms and conditions with which you and your vendors must comply. You can select terms from this library to apply to contract and purchasing records.

## Procedure

---

1. In a purchasing or contract application, display the record for which you want to select a term.
2. On the Terms and Conditions tab, click Select Terms.
3. Select the Select Record check box next to each term that you want to associate with the record.
4. Click OK.
5. Optional: Select the term in the Terms and Conditions table window and select the Send to Vendor check box.
6. Save the record.

---

## Warranty Contracts

In the Warranty Contracts application, you create warranty contracts. A warranty contract defines the agreement to maintain one or more assets with an outside service provider for a fee or a scheduled set of payments. The contract also tracks warranty information for assets and locations by time or meter.

### Service contracts

---

You also use a warranty contract to create a service contract. A service contract indicates that an outside service provider maintains one or more assets. Payment for service can be made with a single fee or with a scheduled set of payments.

- [Warranty contracts overview](#)  
You can use a warranty contract to create a service contract. A service contract indicates that an outside service provider maintains one or more assets.
- [Managing warranty contracts](#)  
You can create and update warranty contracts between your company and a vendor. You can also associate assets and locations with contracts to specify the coverage for each asset or location included in a contract. You can associate terms and conditions with contracts.

---

## Warranty contracts overview

You can use a warranty contract to create a service contract. A service contract indicates that an outside service provider maintains one or more assets.

- [Associated warranty contracts](#)  
You can use an approved master contract to create associated warranty contracts for the same vendor. The master contract contains vendor information and defines terms and conditions for transactions with the vendor. The associated contract contains the identifier of the master contract and the current revision number, if applicable.
- [Status of warranty contracts](#)  
As your business needs change, you can change the status of warranty contracts to approved, canceled, closed, or waiting on approval. When you create a warranty contract, the status of the contract is set to draft.
- [Terms and conditions for warranty contracts](#)  
You can associate terms and conditions with a warranty contract. These terms can contain information such as liability concerns, shipping and handling details, or delivery time expectations.
- [Contract revisions](#)  
You can revise a contract record to make changes to the contract that has a status value of `APPR` (approved). The Revise Contract action is available to contracts that do not have an existing revision and that has the status value of `APPR` (approved).
- [Contract statuses](#)  
Contract records have a status to indicate where the record is in a contract life cycle. Because contract records have statuses, you can create Workflow processes for contracts to manage approvals, expirations, renewals, and so forth. When you create a new contract, the Status field is set to DRAFT.

---

## Associated warranty contracts

You can use an approved master contract to create associated warranty contracts for the same vendor. The master contract contains vendor information and defines terms and conditions for transactions with the vendor. The associated contract contains the identifier of the master contract and the current revision number, if applicable.

When you create an associated warranty contract from a master contract, the master contract's vendor information, service level agreements, and certain properties are copied to the associated warranty contract. In addition, the start date is copied from the master contract, which you can change to any date that is after the start date, but before the end date of the master contract.

You create the associated warranty contract in the Master Contracts application. You view and change the associated contract in the Warranty Contracts application.

---

## Status of warranty contracts

As your business needs change, you can change the status of warranty contracts to approved, canceled, closed, or waiting on approval. When you create a warranty contract, the status of the contract is set to draft.

To change the status of a warranty contract, you use the Change Status action. In addition, a workflow process can cause an automatic status change.

To approve a warranty contract, you must specify a vendor, at least one authorized site, and a start date.

---

## Terms and conditions for warranty contracts

You can associate terms and conditions with a warranty contract. These terms can contain information such as liability concerns, shipping and handling details, or delivery time expectations.

You create and maintain terms and conditions in the Terms and Conditions application. You also can create terms for a specific record. These terms remain with the record and do not become part of the library of information in the Terms and Conditions application.

---

## Contract revisions

You can revise a contract record to make changes to the contract that has a status value of **APPR** (approved). The Revise Contract action is available to contracts that do not have an existing revision and that has the status value of **APPR** (approved).

When you revise a contract, all the information from the original contract is duplicated. The information that is duplicated includes contract lines, terms and conditions, associated service level agreements, commodities, authorized sites, and the contract number.

The status value of a revised contract record is **PNDREV** (pending revision). When you update the revised contract record, you can change its status from **PNDREV** to **WAPPR** (waiting on approval) or **APPR**. If you change the revised contract record status to **APPR**, the status value of the predecessor record changes to **REVISD** (revised). A contract record with the status of **REVISD** cannot be edited or reopened.

The Revision field on a contract record specifies the number of times a contract has been revised. When you create a contract record, the revision value is set to zero. Each time you revise a contract, the revision value is set to the next sequential number.

---

## Example of contract revisions

Contract 333, revision 0, requires an extension. The new end date is six months later than the original end date.

Table 1. Original contract

Contract number	Revision number	Status
333	0	APPR

You can use the Revise Contract action to create contract 333, revision 1, with status **PNDREV**. The status of contract 333, revision 0 remains **APPR** and revision 0 is available for use.

Table 2. First contract revision

Contract number	Revision number	Status
333	0	APPR
333	1	PNDREV

You can edit the end date in revision 1 and change its status to **APPR**. The status of revision 0 changes to **REVISD** and revision 0 is no longer available for use.

Table 3. Second contract revision

Contract number	Revision number	Status
333	0	REVISD
333	1	APPR

---

## Contract statuses

Contract records have a status to indicate where the record is in a contract life cycle. Because contract records have statuses, you can create Workflow processes for contracts to manage approvals, expirations, renewals, and so forth. When you create a new contract, the Status field is set to **DRAFT**.

Contract records can have one the following status values:

Table 1. Contract statuses

Status	Description
APPR	The contract record is approved. From this status, you can change the record status to <b>CAN</b> , <b>CLOSE</b> , <b>SUSPND</b> , <b>EXPIRED</b> .
CAN	The contract record is canceled or terminated. You cannot modify a contract record that has this status value.
CLOSE	The contract record is closed and all its terms and conditions are met. You cannot modify a contract record that has this status value.

Status	Description
DRAFT	The contract is a draft. In this status you can edit everything according to the properties for this type of contract. From this status, you can change the record status to WAPPR, APPR, CLOSE or CAN.
EXPIRED	The contract record is expired. The end date for the contract has passed. You cannot modify a contract record that has this status value. You can change the status from expire to pending revision by revising the expired contract.
PNDREV	The contract is a revised version of an existing contract. This status is similar to the draft status, but you can only edit specified fields.
REVISED	The contract record is revised. A REVISED status value is assigned to a revised contract that you have approved. You cannot modify anything on this contract record or change its status.
SUSPND	The contract record is suspended. You cannot modify anything on the contract except to change its status to APPR, CAN, or CLOSE.
WAPPR	The contract record is waiting for approval. You can modify the record and change the status to DRAFT, APPR, CLOSE or CAN.
WSTART	The contract record is waiting to start. This status value is assigned to the record when its start date is set for the future. You can change the record status value to APPR.

## Managing warranty contracts

You can create and update warranty contracts between your company and a vendor. You can also associate assets and locations with contracts to specify the coverage for each asset or location included in a contract. You can associate terms and conditions with contracts.

- [Creating warranty contracts](#)  
You create warranty contracts to define the agreement to maintain one or more assets with an outside service provider for a fee or a scheduled set of payments.
- [Estimating payments for service warranty contracts](#)  
To track payment information, you can estimate the payments for service warranty contracts.
- [Authorizing sites with contracts](#)  
You can authorize one or more sites on a contract so that they are available for use in the authorized sites. You can add sites from other organizations to the contract only when the applicable sites use the same company and item sets. You can also change vendor data when you add sites to a contract. For example, you can authorize a local vendor branch for each site.
- [Selecting sites for contract authorizations](#)  
You can select multiple sites to authorize for a contract. You can perform this action from more than one application.
- [Associating service level agreements with contracts](#)  
A service level agreement is a written agreement between a service provider and its customers that defines the formal commitments. The agreement documents the service to be provided or received, the agreed upon service levels for the service, and the means of measuring or quantifying the level of service.
- [Revising contracts](#)  
You can create a revised version of a contract. You can also create multiple revisions of a contract.
- [Creating and associating terms](#)  
You can associate specific terms and conditions with contracts and records.

## Creating warranty contracts

You create warranty contracts to define the agreement to maintain one or more assets with an outside service provider for a fee or a scheduled set of payments.

### Procedure

1. In the Warranty Contracts application, click New Warranty Contract.  
The status is set to draft and the start date is set to the current date.
2. In the Type field, specify whether you are creating a warranty or service contract.
3. Specify the value for currency.
4. Optional: Specify additional details and vendor information.
5. Save the contract.

### What to do next

New contracts are assigned a unique contract number. You can append data to this number to differentiate this contract from others. For example, when you have multiple sites and want to track contracts associated with them individually, you can append a site identifier to the contract number.

- [Associating assets with warranty contracts](#)  
You associate specific assets with a warranty so that the assets inherit all coverage that is specified on the warranty contract.
- [Associating locations with warranty contracts](#)  
To manage your warranty contracts, you can associate specific locations with warranty contracts.
- [Specifying service type and duration of warranty contracts](#)  
In the Warranty Contracts application, you can manage warranty contracts by specifying the service type and duration of the warranty contract.

## Associating assets with warranty contracts

You associate specific assets with a warranty so that the assets inherit all coverage that is specified on the warranty contract.

## Before you begin

To associate assets with a contract, the contract must be approved.

## Procedure

1. In the Warranty Contracts application, select the contract with which you want to associate assets.
2. Click the Associated Assets tab.
3. Click Select More Assets.
4. In the Select Assets window, select the assets that you want to associate with the contract.
5. Click OK.
6. For each asset that you selected, complete the following steps:
  - a. In the Assets/Locations table window, select the asset.
  - b. In the Contract Lines table window, specify a start date.
  - c. Optional: In the Meters table window, update the meter information.
7. Save your changes.

## Associating locations with warranty contracts

To manage your warranty contracts, you can associate specific locations with warranty contracts.

## Before you begin

To associate locations with a warranty contract, that contract must be approved.

## Procedure

1. In the Warranty Contracts application, select the contract with which you want to associate locations.
2. Click the Associated Assets tab.
3. Click Select Locations.
4. Select the locations that you want to associate with the contract.
5. Click OK.
6. For each location that you selected, complete the following steps:
  - a. In the Assets/Locations table window, select the location.
  - b. In the Contract Lines table window, specify a start date.
  - c. Optional: In the Meters table window, update the meter information.
7. Save your changes.

## Specifying service type and duration of warranty contracts

In the Warranty Contracts application, you can manage warranty contracts by specifying the service type and duration of the warranty contract.

## About this task

You can only add contract lines to contracts that are in a status of draft, pending revision, or waiting on approval.

## Procedure

1. In the Warranty Contracts application, select the contract for which you want to specify the service type and duration.
2. Click the Contract Lines tab.
3. In the Contract Lines table window, click New Row.
4. Select one of the following values for line type:

Option	Description
Service	If the line type is for a service, provide a description. Service is the default value.
Standard Service	If the line type is for a standard service, specify a value in the Item field.

5. Optional: If the payment schedule property is selected on the Properties tab, specify the extended cost or lump sum cost of the line in the Line Cost field.
6. Specify values for the duration and time unit.

The Time Unit field works with the Duration field.

For example, to set the duration to one year, enter 1 in the Duration field, and specify years in the Time Unit field.
7. Optional: Provide additional contract line information.
8. In the Meter Lines for Contract Line table window, click New Row.

The contract line number changes with the contract line that you selected.
9. Specify values for the measure unit and the duration.
10. Save your changes.

---

## Estimating payments for service warranty contracts

To track payment information, you can estimate the payments for service warranty contracts.

### Before you begin

---

To estimate payments for a service warranty contract, you must specify a payment schedule on the Properties tab.

### About this task

---

The status of the warranty contract must be draft, pending revision, or waiting on approval.

### Procedure

---

1. In the Warranty Contracts application, select the contract for which you want to estimate payments.
  2. Select the Manage Payments action.  
The Manage Payments window displays the total cost of the service lines in the Total Line Costs field.
  3. Specify the start date and end date of the payments.  
If the status of the contract is pending revision and at least one invoice has been paid, you cannot change the Start Date field.
  4. Click Schedule to specify a payment schedule.
  5. Click Estimate Payments.  
The estimated payment is shown in the Payment field.
  6. Click OK to apply the estimated payment to the contract.
  7. Save your changes.
- [Creating one-time payments for warranty contracts](#)  
To manage payments within your organization, you can create one-time payments for warranty contracts.
  - [Creating payment schedules for warranty contracts](#)  
You can create a payment schedule to make a series of payments over time for a warranty contract.

---

## Creating one-time payments for warranty contracts

To manage payments within your organization, you can create one-time payments for warranty contracts.

### Before you begin

---

To create one-time payments, the payment schedule property must be selected on the Properties tab.

### About this task

---

The status of the contract must be draft, pending revision, or waiting on approval.

### Procedure

---

1. In the Warranty Contracts application, select the contract for which you want to create a one-time payment.
2. Select the Manage Payments action.
3. Optional: In the Manage Payments window, change the description.
4. Specify the payment value.
5. Optional: Specify a tax code.  
The tax amount is calculated.
6. In the Target Invoice Status field, specify the status for the invoice that is generated for the payment.
7. Specify values for the start date and general ledger debit account.
8. Click OK.
9. Save your changes.
10. Select the Change Status action.
11. Change the status of the contract to approved.  
The payment is scheduled for the start date, the scheduled invoice is generated, and the value of the invoice is displayed in the Total Cost field.

---

## Creating payment schedules for warranty contracts

You can create a payment schedule to make a series of payments over time for a warranty contract.

### Before you begin

---

To create one-time payments, the payment schedule property must be selected on the Properties tab.

## About this task

The status of the contract must be draft, pending revision, or waiting on approval.

## Procedure

1. In the Warranty Contracts application, select the contract for which you want to schedule payments.
2. Select the Manage Payments action.
3. Optional: In the Manage Payments window, change the description.
4. In the Payment field, specify the amount of each payment and the tax code.  
The tax amount is calculated.
5. In the Target Invoice Status field, specify the status for the invoice that is generated for the payment.
6. Specify the start date and end dates for the payments.  
If the status of the contract is pending revision and at least one invoice has been paid, you cannot change this value.
7. Specify a value for the schedule for the payments and the general ledger debit account.
8. Click Estimate Payment.  
The payment amount is calculated, based on the schedule that you specified, and the amount is displayed in the Payment field.
9. Click OK to accept the payment amount.
10. Save your changes.
11. Select the Change Status action.
12. Change the status of the contract to approved.  
The payments are scheduled to begin on the start date, the scheduled invoices are generated, and the total value of all the invoices is displayed in the Total Cost field.

## Authorizing sites with contracts

You can authorize one or more sites on a contract so that they are available for use in the authorized sites. You can add sites from other organizations to the contract only when the applicable sites use the same company and item sets. You can also change vendor data when you add sites to a contract. For example, you can authorize a local vendor branch for each site.

## Before you begin

You must choose a vendor for the contract before you can authorize a site.

## About this task

You can authorize sites for contracts that have a status value of waiting for approval (WAPPR) or draft (DRAFT). You must assign one default vendor for each site.

If you change the value in the Vendor field after you authorize a site, the asset management system copies the new vendor information to the rows that have a default vendor value. The asset management system also deletes the rows that have no default vendor value.

## Procedure

1. In a contract application, display the contract record that you want to update.
2. Select the Authorize Sites action.
3. Perform one of the following actions:

Option	Description
Authorize an individual site	<ol style="list-style-type: none"><li>a. Click New Row.</li><li>b. In the Vendor field, enter a value.</li><li>c. In the Site field, enter a value.</li><li>d. Select the Default check box to specify whether you want the vendor to be the default vendor.</li><li>e. Enter values in the Bill To and Attention fields.</li><li>f. Click OK to authorize the site.</li></ol>
Authorize multiple sites	<ol style="list-style-type: none"><li>a. Click Select Sites.</li><li>b. Select the appropriate sites.</li><li>c. Click OK.</li><li>d. Enter values in the Bill To and Attention fields.</li><li>e. Click OK to authorize the sites.</li></ol>

## Selecting sites for contract authorizations

You can select multiple sites to authorize for a contract. You can perform this action from more than one application.

## Procedure

1. In a contract application, display the contract record for which you want to select sites.
2. Select the Authorize Sites action.

3. Click Select Sites.
4. Select one or more sites. To select a site, select the Select Record check box next to each site you want to add.
5. Click OK. The selected sites are copied to the Authorize Sites window.
6. Optional: Modify the default Bill To and Attention fields.
7. Click OK.

---

## Associating service level agreements with contracts

A service level agreement is a written agreement between a service provider and its customers that defines the formal commitments. The agreement documents the service to be provided or received, the agreed upon service levels for the service, and the means of measuring or quantifying the level of service.

### Procedure

---

1. In a contract application, display the contract record for which you want to select one or more service level agreements.
2. Select the Associate SLAs action.
3. Click Select SLAs.
4. Select one or more service level agreements to associate with the contract.
5. To select a service level agreement from the same organization that created the contract, select the Select Record check box. You can select more than one agreement. To cancel a selection, clear the check box. To select all agreements in the list, select the Select All check box next to the Agreements column.
6. Click OK. The service level agreements are copied to the Associate SLAs window.
7. Click OK.

---

## Revising contracts

You can create a revised version of a contract. You can also create multiple revisions of a contract.

### Before you begin

---

A contract must have an Approved (APPR) status before you can revise it.

### About this task

---

The Revision field of the contract indicates the number of times a contract has been revised. When you insert a contract record, the revision number is zero. As you make revisions to the contract, the next consecutive number is inserted in the Revision field. This option is available in more than one application.

### Procedure

---

1. In a contract application, display the contract you want to revise.
2. Select the Revise Contract action.
3. Type a description.
4. Optional: Fill in additional fields as needed. An asterisk (\*) indicates a required field.
5. Click OK. A new version of the contract with a status of pending revision (PNDREV) is created. Note that the original version of the contract remains in the APPR (Approved) status and is still valid while you are completing the revision.
6. Make the required changes to the revised version of the contract.
7. Change the status of the revised contract to APPR (Approved) to make it active. This action also changes the status of the originating contract to REVISED.
8. Click Save Contract.

---

## Creating and associating terms

You can associate specific terms and conditions with contracts and records.

- [Creating terms](#)  
You can create terms and conditions that can later be associated with a contract or purchasing record. Terms and conditions can contain information such as: liability concerns, shipping and handling details, and delivery time expectations.
- [Associating existing terms with records](#)  
You can associate terms and conditions with records to define the rules that your company and your vendors must follow on purchase order and contract transactions.

---

## Creating terms

You can create terms and conditions that can later be associated with a contract or purchasing record. Terms and conditions can contain information such as: liability concerns, shipping and handling details, and delivery time expectations.

## Before you begin

---

Terms and conditions can only be added to purchasing or contracts records set at statuses in progress or waiting on approval.

## Procedure

---

1. In a purchasing or contract application, display the record for which you want to create a term.
2. On the Terms and Conditions tab, click New Row.
3. Specify the sequence and term.
4. Optional: Select the Send to Vendor check box.
5. Save the record.

## What to do next

---

You can set default term and condition values according to site and contract type in the Organizations application. When you create a contract record in a contracts application, the contract inherits the default term and condition values that you assigned to the selected contract type in the Organizations application.

## Associating existing terms with records

---

You can associate terms and conditions with records to define the rules that your company and your vendors must follow on purchase order and contract transactions.

## About this task

---

The Terms and Conditions application maintains a library of terms and conditions with which you and your vendors must comply. You can select terms from this library to apply to contract and purchasing records.

## Procedure

---

1. In a purchasing or contract application, display the record for which you want to select a term.
2. On the Terms and Conditions tab, click Select Terms.
3. Select the Select Record check box next to each term that you want to associate with the record.
4. Click OK.
5. Optional: Select the term in the Terms and Conditions table window and select the Send to Vendor check box.
6. Save the record.

## Terms and Conditions

---

You use the Terms and Conditions application to specify and to maintain a library of terms and conditions. You can add the terms and conditions to a purchasing document or to a contract. Terms can contain information such as liability concerns, shipping and handling details, and delivery time expectations.

The terms entered in the Terms and Conditions application are available from tabs in the purchasing and contract applications. From the tabs, you can select a term from the library to associate with a purchasing record or with a contract record.

- [Terms and conditions overview](#)  
Terms and conditions can contain information such as liability concerns, shipping and handling details, and delivery time expectations. You can create term types which can be associated with terms and conditions.
- [Working with terms and conditions](#)  
You can define and delete terms and conditions that can be used in the purchasing and contracts applications. You can associate terms and conditions with purchase order and contract records to determine the rules that your company and your vendors must follow on purchase order and contract transactions.
- [Terms and conditions overview](#)  
Terms and conditions can contain information such as liability concerns, shipping and handling details, and delivery time expectations. You can create term types which can be associated with terms and conditions.

You use the Terms and Condition application to specify that certain terms default on all purchase orders that are created.
- [Sorting terms by type](#)  
You use the Terms and Conditions application to sort terms by type.

---

## Defining terms

You use the Terms and Conditions application to define terms that apply to purchase orders.

## Procedure

---

1. In the Organization table window, select the organization for which you want to define a term.
2. Click New Row.
3. Specify a value in the Term field. The value must be unique.
4. Type a description
5. Optional: Specify a value in the Type field. The value you define can be used to filter the Terms and Conditions library. For example, you might have defined a type as `PURCHASE`, in which all the corresponding records contain information applicable to purchase orders. You could then search on `PURCHASE` and find only the relevant terms.
6. To be able to edit the term when it is associated with records in other applications, select the Editable check box. Otherwise, clear the check box.
7. To have the term appear as a default on all future purchase orders, select the Default on PO check box. Otherwise, clear the check box.
8. Click Save Terms and Conditions.

---

## Creating and deleting terms

You can create terms and conditions for contracts and records. You can delete terms when they are no longer needed.

- [Creating terms](#)  
You can create terms and conditions that can later be associated with a contract or purchasing record. Terms and conditions can contain information such as: liability concerns, shipping and handling details, and delivery time expectations.

You can create terms and conditions that can later be associated with a contract or purchasing record. Terms and conditions can contain information such as: liability concerns, shipping and handling details, and delivery time expectations.
- [Deleting terms](#)  
You use the Terms and Conditions application to delete terms.

---

## Creating terms

You can create terms and conditions that can later be associated with a contract or purchasing record. Terms and conditions can contain information such as: liability concerns, shipping and handling details, and delivery time expectations.

## Before you begin

---

Terms and conditions can only be added to purchasing or contracts records set at statuses in progress or waiting on approval.

## Procedure

---

1. In a purchasing or contract application, display the record for which you want to create a term.
2. On the Terms and Conditions tab, click New Row.
3. Specify the sequence and term.
4. Optional: Select the Send to Vendor check box.
5. Save the record.

## What to do next

---

You can set default term and condition values according to site and contract type in the Organizations application. When you create a contract record in a contracts application, the contract inherits the default term and condition values that you assigned to the selected contract type in the Organizations application.

---

## Deleting terms

You use the Terms and Conditions application to delete terms.

## Procedure

---

1. In the Terms and Conditions application, in the Organization table window, select the organization to which the term belongs.
2. Click the Mark Row for Delete icon. To undo the delete before saving, click the Mark Row for Delete icon once more.
3. Click Save Terms and Conditions.

---

## Associating existing terms with records

You can associate terms and conditions with records to define the rules that your company and your vendors must follow on purchase order and contract transactions.

---

## About this task

The Terms and Conditions application maintains a library of terms and conditions with which you and your vendors must comply. You can select terms from this library to apply to contract and purchasing records.

---

## Procedure

1. In a purchasing or contract application, display the record for which you want to select a term.
2. On the Terms and Conditions tab, click Select Terms.
3. Select the Select Record check box next to each term that you want to associate with the record.
4. Click OK.
5. Optional: Select the term in the Terms and Conditions table window and select the Send to Vendor check box.
6. Save the record.

---

## Modifying terms

You use the Terms and Conditions application to modify the terms of a purchase order.

---

## About this task

Modifying a term does not update records that reference the term. The modifications only affect future instances.

---

## Procedure

1. In the Terms and Conditions application, in the Organization table window, select the organization to which the term you want to edit belongs.
2. Click View Details.
3. In the Details table window, edit the term information
4. Click Save Terms and Conditions.

---

## Modifying the sequence of terms for records

You can change the order in which the terms for a record display. You can modify the sequence to display a more logical order, or to list certain terms sequentially.

---

## Procedure

1. In the appropriate Purchasing or Contract application, display the record with which you want to associate a term.
2. Click the Terms and Conditions tab.
3. In the Terms and Conditions table window, locate the rows for which you want to change the sequence.
4. In the Sequence column for the appropriate rows, specify a value. You can enter any integer up to 9999. The product defaults the sequence numbers to multiples of 10. You can rearrange the order without renumbering the entire sequence.
5. Click Save.

---

## Setting default terms

You use the Terms and Condition application to specify that certain terms default on all purchase orders that are created.

---

## About this task

Modifying a term does not update records that reference the term. The modifications only affect future instances.

---

## Procedure

1. In the Terms and Conditions application, in the Organization table window, select the organization to which the term you want to edit belongs.
2. Click View Details.
3. In the Details table window, select the Default on PO check box.
4. Click Save Terms and Conditions.

---

## Sorting terms by type

You use the Terms and Conditions application to sort terms by type.

## About this task

---

Only terms associated with one organization can be viewed at one time.

## Procedure

---

1. In the Terms and Conditions application, in the Organization table window, select the organization to which the term you want to sort by type belongs.
2. In the Terms and Conditions table window for that site, click the Type column title. The terms are sorted by type.

## Financial module

---

You use the applications in the Financial module to define and manage currency codes, exchange rates, general ledger accounts and resource codes. You can also track project management costs.

- **Currency Codes**  
You use the Currency Codes application to define and manage currencies. A currency code is a user-defined value that represents a currency. For example, CND represents the Canadian dollar.
- **Exchange Rates**  
In the Exchange Rates application, you can create exchange rates and modify existing rates. You can also configure multiple base currencies to ensure that all appropriate currencies and exchange rates are in the database. You can also ensure that all affected applications perform the correct calculations.
- **Chart of Accounts**  
In the Chart of Accounts application, you can set up organization-specific general ledger accounts and resource codes for standard accounting functions. You create accounts and resource codes to correspond with accounts that you use in your external accounting system. You can also set up financial periods, and specify general validation options.
- **Cost Management**  
You use the Cost Management application, with an external project costing system, to track project costs and manage budgets more effectively. By creating a project in the Cost Management application and linking work orders to that project in the Work Order Tracking application, you can generate project cost information to track the financial resources required to complete the project.
- **Budget monitoring**  
In the Budget Monitoring application, you can create budget records to monitor transactions in a financial period. Monitoring budget costs can help to ensure that projects or activities, such as work orders, are completed within an agreed budget and can improve estimation of the costs of future projects.

## Currency Codes

---

You use the Currency Codes application to define and manage currencies. A currency code is a user-defined value that represents a currency. For example, CND represents the Canadian dollar.

The Currency Codes application stores currency codes at the system level. All organizations can view, use, and add currency codes. After you create an active currency code, you can use that currency code in applications that have a Currency field. For example, the Purchase Requisitions application, Purchase Orders application, Invoices application, and Companies application have a Currency field.

Though you use the Currency Codes application to define currencies, you use the following applications to manage other aspects of currency administration:

- Organizations - to specify the base currency for an organization.
- Exchange Rates - to specify exchange rates between currencies for defined periods.

## Foreign currencies

---

When you have purchasing records in a foreign currency, the current exchange rate is used to calculate the base cost in the currency of your company. Purchasing records include purchase requisitions, purchase orders, and invoices.

## Deleting currency codes

---

You can delete currency codes that you are no longer using. You cannot delete currency codes if they meet any of these conditions:

- The currency code is used in a Currency field on any record (unless the status is closed or cancelled).
- The currency is used in an active exchange rate in the Exchange Rates application.
- The currency is specified as the base currency for an organization.
- The currency code is referenced in the following tables: PO, PR, COMPANY INVOICE, MATRECTRANS, MATUSETRANS, SERVRECTRANS, INVOICETRANS, and RFQVENDOR (unless the records are flagged as history or inactive).

## Exchange Rates

---

In the Exchange Rates application, you can create exchange rates and modify existing rates. You can also configure multiple base currencies to ensure that all appropriate currencies and exchange rates are in the database. You can also ensure that all affected applications perform the correct calculations.

Because exchange rates are stored at the organization level, each organization defines and maintains its own exchange rates.

When you specify an amount in a foreign currency, the active exchange rate is located. Then, the cost in the base currency of your company is calculated. If the Exchange Rates application finds that the exchange rate between two currencies is not defined, specific rules and logic are used to calculate the exchange rate from other exchange rates.

To define currency codes, use the Currency Codes application. To specify the base currency for an organization, use the Organizations application.

---

## Chart of Accounts

In the Chart of Accounts application, you can set up organization-specific general ledger accounts and resource codes for standard accounting functions. You create accounts and resource codes to correspond with accounts that you use in your external accounting system. You can also set up financial periods, and specify general validation options.

The application stores general ledger accounts at the organization level. Because general ledger accounts cannot be shared across organizations, each organization must have its own chart of accounts system.

To use the Chart of Accounts functions appropriately, specify the following information in other applications:

- In the Database Configuration application, specify the system-level, default format of general ledger account codes, such as the number and the length of components.
- In the Organizations application, define tax codes, rates, and dates.
- In the Domains application, add company types.

---

## Cost Management

You use the Cost Management application, with an external project costing system, to track project costs and manage budgets more effectively. By creating a project in the Cost Management application and linking work orders to that project in the Work Order Tracking application, you can generate project cost information to track the financial resources required to complete the project.

The Cost Management application supports the integration of the enterprise application management system and Oracle® Projects applications. If the Adapter for the Oracle® application is installed and the projects interface is activated, the Cost Management application can retain projects, tasks, and cost summary information from Oracle® Projects.

---

## Deleting cost management projects

In the Cost Management application, you use the Delete Project action to delete projects that are not parents to other projects. To delete a parent project, you must clear the Parent Project field for the child projects or delete the child projects.

Similarly, you can delete a task that has no child tasks.

---

## Budget monitoring

In the Budget Monitoring application, you can create budget records to monitor transactions in a financial period. Monitoring budget costs can help to ensure that projects or activities, such as work orders, are completed within an agreed budget and can improve estimation of the costs of future projects.

As an administrator, you can create budget records by configuring focal points and calculation rules. Focal points represent the item that you are monitoring in the budget record, such as assets, locations, or general ledger accounts or components. You create focal points, for example, to track costs on check type master preventive maintenance (PM) records for a specific model of an asset. You can configure calculation rules that are based on estimated, committed, and actual costs.

Users create transactions for work orders, purchase requisitions, purchase orders, receipts, invoices, and issues. The budget records then monitor these transactions and are used to create reports.

Budget reports provide a summarized and detailed view of costs by type, such as labor, tools, services, materials. Budget reports also provide a summarized and detailed view of costs by status such as estimated, committed, and actual costs, and compare them with related budgeted amounts.

---

## Integration module

The Integration module contains a set of applications that help you to integrate the system with your enterprise applications. You also can create business flows between the system and your other enterprise applications.

The Integration Framework includes the following key features:

- Pre-defined content to assist in implementing integration requirements in a timely manner. This content is a comprehensive set of outbound (channels) and inbound (services) integration interfaces that are available to use immediately.
- Applications to configure, pre-define, and to create new integration definitions.

- Applications to facilitate the customization of pre-defined content using a processing rule engine, Java™, and Extensible Stylesheet Language Transformations (XSLT).
- Support for multiple communication modes, including:
  - Web Services.
  - HTTP.
  - Java Message Service (JMS) messaging.
  - Database interface tables.
  - XML/Flat files.
  - Event-based, batch, program-initiated, and user-initiated processing of outbound and inbound messages.
  - Load and performance scalability using JMS queues.
  - Support for clustered environments that reduce system downtime, increase system availability, and improve system performance.
  - Support for UI-based integration, including context-based launching of external applications.
  - Support for integration to Operational Management Products (OMPs).
  - Support for bulk export of data using user-defined SQL query.
  - Support for bulk importing of XML or flat files.
  - Dynamic XML schema generation for all integration artifacts (channels and services).
  - Dynamic generation of Web Services Interoperability (WS-I) compliant Web Services, including Web Service Definition Language (WSDL).
  - Provides the concept of an adapter that is used to group related integration artifacts. You can configure and deploy adapters for enterprise connectivity with various systems. Each adapter can have its own interface and delivery mode. Pre-configured adapters for Oracle and SAP are available as add-ons.
- **[Object structures](#)**  
An object structure is the common data layer that the integration framework components use for outbound and inbound application message processing. An object structure consists of one or more related business objects that define the content of an XML or JSON message (schema).
- **[Publish Channels](#)**  
You can use the Publish Channels application to create and modify publish channel records, which send outbound integration messages to an external system. When publish channel processing is triggered, the integration message is delivered to the outbound queue, from where it is then delivered to an external system.
- **[Invocation Channels](#)**  
You use the Invocation Channels application to create and manage invocation channel records. Invocation channels support the service-oriented architecture capability by enabling the integration framework to call external applications and process the responses. The execution of an invocation channel is synchronous, and a response can be returned from the external service to the caller without using a queue.
- **[Enterprise Services](#)**  
You can use the Enterprise Services application to create and modify enterprise service records which receive inbound integration messages from an external system. When enterprise service processing is triggered, the integration message is moved into an inbound queue, from where it is processed into the application.
- **[Web Services Library](#)**  
You can use the Web Services Library application to create and deploy web services for all service types, object structure, enterprise, and standard services. By deploying web services, external applications can make SOAP-based calls to retrieve or update business object data. The application generates the XML schema and Web Services Description Language (WSDL) files for all of your web services.
- **[Endpoints](#)**  
You use the Endpoints application to create and manage endpoints and their handlers. Endpoints and handlers enable the routing of outbound messages to an external application. Endpoints are used for outbound message processing only, with the exception of interface tables, where the endpoint defines the location of the interfaces for both inbound and outbound processing.
- **[External Systems](#)**  
You use the External Systems application to create and manage external system records. External systems are any external applications that you exchange data with using the integration framework.
- **[Logical Management Operations](#)**  
Logical management operations define actions that the integration framework takes on operational management products. Operational management products are individual external products that you can use to implement logical management operations.
- **[Integration Modules](#)**  
You use the Integration Modules application to create and manage integration module records. An integration module is a component that resides between the process management product and the operational management product.
- **[Launch in Context](#)**  
You use the Launch in Context application to create and modify launch entry records which open an external application in the same or a different browser session. You can open applications independently or as part of an application integration scenario.
- **[Message Tracking](#)**  
You use the Message Tracking application to track and view the processing history of queue-based enterprise service, and queue-based publish channel messages.
- **[Message Reprocessing](#)**  
You use the Message Reprocessing application to download, view, and manage integration framework messages that have been flagged with an error. You can download, view, and correct the error XML file without needing to gain access the integration server error files.
- **[JSON Mapping](#)**  
You use the JSON Mapping application to map data from external systems into the Maximo database, using JSON format.
- **[JSON Resources](#)**  
You use the JSON Resources application to show external data in the Maximo database.
- **[Interactions](#)**  
With the interactions module, you can quickly integrate an application with a web service without authoring Java code or redeploying Java files.
- **[API keys application](#)**  
You use API keys to enable an inbound machine-to-machine integration for an external client. API keys can be used by the OSLC and REST APIs and also can be used as part of the Manage integration framework.

---

## Object structures

An object structure is the common data layer that the integration framework components use for outbound and inbound application message processing. An object structure consists of one or more related business objects that define the content of an XML or JSON message (schema).

An object structure provides the message content for channels and services and enables application-based import and export. In addition, an object structure, on its own, can be called as a service, supporting the Create, Update, Delete, Sync, and Query operations.

Note: Use the object structures that are provided with your Manage system whenever possible, instead of creating a new or duplicate object structure. If the outbound integration messages are in the JSON format, you can modify which data is shared from that object structure by creating a message template for the object structure.

- [Identification of object structure data](#)

If you are adding or modifying object structures, identification of the data to include requires some understanding of the applications and their associated objects. Review the data model of an application to determine which objects, database tables, and views contain the data to transfer to and from an external system.

- [Alternate keys](#)

Inbound message processing relies on the key field(s) of an object to find an existing record in the system to support updates and deletes. The default processing relies on the primary key to retrieve existing records. Sometimes a primary key is unknown to an external application and an alternate key (known by the external system) is defined to support the updating and deleting of records by the external system.

- [Object fields](#)

The integration framework and the external system exchange a subset of the data columns in the objects within the object structure. Subject to certain restrictions, you can control the content of the object fields within the message by including persistent and nonpersistent columns of individual objects.

- [Interface table and flat file considerations](#)

If you use an object structure for exchanging data with interface tables or flat files, you must ensure that the object structure does not contain duplicate column names.

- [Modification of a predefined object structure](#)

There are certain restrictions if you modify a predefined object structure.

- [Configuring an object structure](#)

You can create new object structures and during that process you can generate schema files, include or exclude fields, and resolve alias conflicts. You can also specify inbound setting restrictions, set advanced configuration properties, configure application authorization, and configure message templates for outbound integration messages.

- [Message templates that specify outbound data](#)

Message templates are an additional option for editing the structure of an outbound message. You use message templates to limit which data from the associated object structure is included in the message.

---

## Publish Channels

You can use the Publish Channels application to create and modify publish channel records, which send outbound integration messages to an external system. When publish channel processing is triggered, the integration message is delivered to the outbound queue, from where it is then delivered to an external system.

Publish channel processing can be triggered by one of the following event-driven or user-driven events:

- Object events (insert, update, delete)
- Data export

The content of a publish channel data structure is based on the schema of the associated object structure. You can use the object structure processing rules to define the conditions under which the integration framework can skip or stop a message. The processing rules can also change the data in the publish channel before it is delivered to the external system. You can also provide processing logic against the integration message by using a Java™ class or XSL map.

---

## Invocation Channels

You use the Invocation Channels application to create and manage invocation channel records. Invocation channels support the service-oriented architecture capability by enabling the integration framework to call external applications and process the responses. The execution of an invocation channel is synchronous, and a response can be returned from the external service to the caller without using a queue.

You can configure the invocation channel record to integrate with the Integration Module application.

The initiation of an invocation channel is implemented by using an action class that calls an invocation channel. You can implement an action by using the following means:

- An application user interface control
- Workflow routing
- Escalation

---

## Enterprise Services

You can use the Enterprise Services application to create and modify enterprise service records which receive inbound integration messages from an external system. When enterprise service processing is triggered, the integration message is moved into an inbound queue, from where it is processed into the application.

Enterprise service processing can be triggered by the following:

- Web Service invocation or HTTP servlet call

- Interface table cron task
- User-initiated or cron task-initiated data import
- Message delivery directly to an inbound JMS message

The content of an enterprise service data structure is based on the content of the associated object structure. You can use the processing rules to define the conditions under which the integration framework can skip or stop a message. The processing rules can also change the data in the enterprise service message before it is delivered to the external system. You can also provide processing logic for the integration message by using a Java™ class or XSL map.

---

## Web Services Library

You can use the Web Services Library application to create and deploy web services for all service types, object structure, enterprise, and standard services. By deploying web services, external applications can make SOAP-based calls to retrieve or update business object data. The application generates the XML schema and Web Services Description Language (WSDL) files for all of your web services.

---

## Endpoints

You use the Endpoints application to create and manage endpoints and their handlers. Endpoints and handlers enable the routing of outbound messages to an external application. Endpoints are used for outbound message processing only, with the exception of interface tables, where the endpoint defines the location of the interfaces for both inbound and outbound processing.

You can use endpoints to perform the following tasks:

- Identify a target location for integration framework data publication
- Use an encrypted value to apply additional security for data storage and display
- Work with a handler to identify how outbound data is routed to a target location
- Work with a handler to define the data format that is used for data transfers

---

## External Systems

You use the External Systems application to create and manage external system records. External systems are any external applications that you exchange data with using the integration framework.

You can use the External Systems application to perform the following functions:

- Name the systems that exchange data with the integration framework.
- Specify the protocol that the integration framework uses to send data to the external system.
- Identify the publish channels and enterprise services that each system implements.
- Create interface tables.
- Perform data import and export.
- Manage JMS queues.

---

## Logical Management Operations

Logical management operations define actions that the integration framework takes on operational management products. Operational management products are individual external products that you can use to implement logical management operations.

You can use the Logical Management Operations application to identify the following characteristics of a logical management operation:

- The source and response object names that associated with the logical management operation, which defines the data source and target for the logical management operation.
- The specific object field attributes the data source and target use.
- The invocation pattern the logical management operation uses.
- A secondary namespace identifier for the logical management operation record.

To implement a logical management operation, you define a relationship between the integration module and the logical management operation in the Integration Modules application. You can use the integration module endpoint handler to identify how the integration framework communicates with the operational management product. The integration module can then map a response to your defined response object in the logical management operation. You can use the View IM action to view the related integration modules for a selected logical management operation.

---

## Integration Modules

You use the Integration Modules application to create and manage integration module records. An integration module is a component that resides between the process management product and the operational management product.

You can use the Integration Module application to associate logical management operations and operational management products with an integration module record. The associations with logical management operations define the actions that process managers run. The associations with operational management products define the external applications that you can invoke from a process management product.

You must define and configure the following components before the process management product can call an integration module to perform a logical management operation on an operational management product:

- Logical management operations
- Operational management products
- Invocation channels
- Object structures
- Endpoints

---

## Launch in Context

You use the Launch in Context application to create and modify launch entry records which open an external application in the same or a different browser session. You can open applications independently or as part of an application integration scenario.

The launch entry record can utilize the following options in the Application Designer to open an external application:

- Select action menu items
- Hyperlinks
- Buttons

You use the Launch in Context application to create and update launch entries. A launch entry defines a URL that opens a console for an external application. The launch entry can pass data, referred to as context, from the application to the external console. You can configure a console URL for any application with a web-based console. Additionally, you can configure console URLs for consoles that use Java™ Web Start. You cannot use a launch entry to open applications that are not enabled for the web. You can configure a launch point from any application.

---

## Message Tracking

You use the Message Tracking application to track and view the processing history of queue-based enterprise service, and queue-based publish channel messages.

The Message Tracking application works with the Message Reprocessing application. When you use the Message Tracking application, you can determine which messages are flagged with an error. You then can select a failed message and go to the Message Reprocessing application to take appropriate action to correct erroneous data.

When you enable message tracking, the integration framework writes all the processed messages to the asset management system database. The asset management system then assigns a status to each message. The status represents the message position in the integration framework queue-based processing cycle.

---

## Message Reprocessing

You use the Message Reprocessing application to download, view, and manage integration framework messages that have been flagged with an error. You can download, view, and correct the error XML file without needing to gain access the integration server error files.

Failed messages can be managed in the following ways in the Message Reprocessing application:

- Change the message statuses to stop message processing or to reprocess a message
- Correct, process, save, or cancel the error XML file
- Delete the message from the database

The Message Reprocessing application works with the Message Tracking application when you enable message tracking in either the Publish Channels application or the Enterprise Services application. In the Message Tracking application, you can determine which tracked messages are flagged with an error.

If you have not enabled message tracking, you can go to the Message Reprocessing application to check for transaction errors.

---

## JSON Mapping

You use the JSON Mapping application to map data from external systems into the Maximo® database, using JSON format.

For more information, see [JSON Mapping application information](#).

---

## JSON Resources

You use the JSON Resources application to show external data in the Maximo® database.

## Interactions

With the interactions module, you can quickly integrate an application with a web service without authoring Java™ code or redeploying Java files.

- [Web service interactions overview](#)  
An interaction can start a web service and send data to it from an application. The interaction can then display data returned from the web service and save this data to the application database.
- [Creating interactions](#)  
The Create Interactions wizard application guides you through all the steps required to create and configure an interaction. After you complete the wizard process and test the interaction, users can start working with it immediately with no requirement for additional configuration or deployment.

---

## Web service interactions overview

An interaction can start a web service and send data to it from an application. The interaction can then display data returned from the web service and save this data to the application database.

To implement interactions requires knowledge of:

- XML schemas
- Web services
- The integration framework
- Customizing applications and application user interfaces

An interaction can manage the following processes:

- Prepare a request for a web service.
- Invoke a web service from an application.
- Retrieve results from the web service in the form of a response.
- Display the results in an application.
- Optionally, apply the response data into the system database.
- Report any errors that occur during the request or response processes.

Two applications are provided to help you create and manage interactions:

- Create and configure interactions in the Create Interaction application.
- Review, modify, and delete interactions in the Interactions application.

After you create an interaction, users can perform the following tasks from the application user interface:

- Start the interaction.
- View and, if configured, change the parameters of the request to the web service.
- Invoke the web service by sending the request.
- Optionally, view data received from the web service and commit this data to the database.
- [Creating interactions](#)  
The Create Interactions wizard application guides you through all the steps required to create and configure an interaction. After you complete the wizard process and test the interaction, users can start working with it immediately with no requirement for additional configuration or deployment.

---

## Creating interactions

The Create Interactions wizard application guides you through all the steps required to create and configure an interaction. After you complete the wizard process and test the interaction, users can start working with it immediately with no requirement for additional configuration or deployment.

---

## Before you begin

Before you run the Create Interactions application, ensure that you have all the information required for the configuration. During the process, you must specify the web service, define the structure of messages, and map the data between the application and the web service.

A logging tool is provided to log configuration activity and maintain a log file of the items that are configured. To generate a detailed log of the configuration, in the Logging application, set the interaction logger to DEBUG mode.

---

## Procedure

1. To configure the web service for the interaction, in step 1 of the process:
  - a. Specify the URL for the WSDL file for the web service.
  - b. When the screen refreshes with information from the WSDL file, specify one port for the interaction.

- c. Specify one operation for the interaction and check Process Response if you want the web service to return data to the application during the interaction.
2. Review the contents of the request to the web service in step 2, and modify the request object structure by removing any unnecessary elements.
3. Optional: Review the contents of the response from the web service in step 3, and modify the response object structure by removing any unnecessary elements.  
This step is included only if you checked the Process Response option in step 1.
4. To configure the application for the interactions, in step 4 of the process:
  - a. Specify the application that uses the interaction.
  - b. Configure the application binding for the interaction, including the main object, the signature option, the interaction mode, and the user interface components.
  - c. Specify the security groups that are authorized to initiate the interaction.
5. Configure the Request tab of the Interactions window in step 5, including specifying the fields that users can see and whether they can edit them.
6. Optional: Configure the Response tab of the Interactions window in step 6, including specifying the fields that users can see and whether they can edit them.  
This step is included only if you checked the Process Response option in step 1.
7. You can map information from the application to the web service in step 7. Mapped information is entered automatically into the request when users start the interaction.
8. Optional: You can map information from the web service to the application in step 8. If you check the Commit Response option, the mapped information is saved automatically to the database.
9. Review the configurations in the final step of the process.

## What to do next

To monitor the time it takes to execute the interaction, in the Logging application, set the integration logger to either INFO mode or DEBUG mode.

You can view the interaction and modify mapping information in the Interactions application. If you intend to modify an interaction, select the Deactivate Interaction action before you make any changes and reactivate it after you complete the modification.

## API keys application

You use API keys to enable an inbound machine-to-machine integration for an external client. API keys can be used by the OSLC and REST APIs and also can be used as part of the Manage integration framework.

In a machine-to-machine integration, an external machine interacts with Manage data in the Manage system without the use of a browser. API keys are a native form of authentication that do not require an external repository for password storage.

By default, all API keys are encrypted at storage. This setting is controlled by the `mxe.secureapikey` property.

## Adding API keys for REST APIs

When an API key is assigned to the external client, the external client can access and interact with data in the Manage system by using the API key as an `apikey` query parameter or an `apikey` request header in REST API calls. REST API calls that use an API key do not create a persistent server connection, and the API key must be part of all REST API requests that the external client makes.

For more information and to use an API key, on the API Keys subtab of the Integration tab of the Administration Work Center, from the Action menu, select API documentation. Select Authorize to use your API key.

To use an API key, go to Integration > API Keys application from the menu.

## Using externally created API keys

You can use externally created API keys as an API key in Maximo® Manage. Create this type of API key by using the `MXAPIAPIKEY` REST API and providing your generated API key by using the "apikey" json property, as shown in the following code:

```
POST /oslc/os/mxapiapikey
{
 "apikey": "<outside generated apikey>",
 "expiration": -1
}
```

## Security access

As the system administrator, you must synchronize Manage users for the external clients before API keys are created for those clients. The permissions that are associated with the API key are determined by the permissions for the associated user. You can create and configure API keys on the API Keys subtab of the Integration tab of the Administration Work Center. You can create and configure API keys from the API Keys application under Integration.

You also can specify security that enables only the logged-in user to create an API key. To limit the creation of API keys to the logged-in user, go to the System Properties application and filter for the `mxe.apikeyforloggedinuser` property. In the Global Value field, specify 1 and save the record. Select Live Refresh to apply the value immediately.

To disable access to the Manage system for an external client, you can delete the associated API key, but the external client might still access the Manage system by using another configured authentication system. If an API key is compromised, delete the key and create another key for that user.

- [Searching for API keys](#)  
You can search for API keys in the API Keys application.

- [Sorting API keys](#)  
You can sort API keys in the API Keys application.
- [Adding API keys](#)  
When an API key is assigned to the external client, the external client can access and interact with data in the Manage system. The interaction happens by using the API key as an apikey query parameter or an apikey request header in REST API calls. REST API calls that use an API key do not create a persistent server connection, and the API key must be part of all REST API requests that the external client makes.
- [Copying API keys](#)  
It is possible to copy an API key value for your use.
- [Deleting API keys](#)  
You can delete an API key if necessary.
- [Changing the layout](#)  
You can switch between a tile and a tabular layout for the APIs you create.

---

## Searching for API keys

You can search for API keys in the API Keys application.

### Procedure

---

In the API Keys application, specify a string in the Search field.  
The search results are displayed based on your search string.

---

## Sorting API keys

You can sort API keys in the API Keys application.

### Procedure

---

In the API Keys application, select a sort criteria from the list.  
The API keys are sorted according to the criteria you select.  
Tip: Use the up or down arrow to sort in ascending or descending order.

---

## Adding API keys

When an API key is assigned to the external client, the external client can access and interact with data in the Manage system. The interaction happens by using the API key as an apikey query parameter or an apikey request header in REST API calls. REST API calls that use an API key do not create a persistent server connection, and the API key must be part of all REST API requests that the external client makes.

### Procedure

---

1. In the API Keys application, click Add API key +.
  2. In the Add API key dialog, select the user the API key is for, in the User field.
  3. Specify the token expiry in minutes period using the + and - controls.
  4. Click Create.
- You can see the API key that you created in the API Keys page.

---

## Copying API keys

It is possible to copy an API key value for your use.

### Procedure

---

In the API Keys application, click Copy key for the API key whose value you want to copy.  
A notification is displayed stating that the key is copied to the clipboard.

---

## Deleting API keys

You can delete an API key if necessary.

### Procedure

---

In the API Keys application, click the Delete icon to delete the API you want to remove.

---

## Changing the layout

You can switch between a tile and a tabular layout for the APIs you create.

### Procedure

---

Select the list or the grid icon to toggle between APIs displayed in a table or APIs displayed as tiles.

- [Managing columns](#)  
You can add or remove columns to the tabular layout of the existing API keys.
- [Viewing APIs with filters](#)  
In the tabular layout of the API Keys page, you can use filters to customize the list displayed and hover over a row to view the copy and delete options.

---

## Managing columns

You can add or remove columns to the tabular layout of the existing API keys.

### Procedure

---

1. In the tabular view of the API Keys page, click the Column Selection icon.
2. Click Manage columns and in the Select value dialog, select the columns that you want to see from the list.
3. Click OK to see the table updated with your column selection.

---

## Viewing APIs with filters

In the tabular layout of the API Keys page, you can use filters to customize the list displayed and hover over a row to view the copy and delete options.

### Procedure

---

Click the Filters icon to see the available filters.  
Note: If you add columns using Manage columns, you can see those column headings as filters.  
The list of API keys in the table is displayed according to the filters that you select.

---

## Inventory module

You use the applications in the Inventory module to manage your inventory of spare parts. You can maximize the availability of items for upcoming work tasks, and also reduce excess inventory balances and related carrying costs.

The goal is to find a balance of inventory stock. Maintenance work can be performed with minimum delays due to unavailable materials, without keeping seldom used items in stock.

Spare-parts management tasks include the following:

- Track the items that you have in stock
- Identify when stock falls below user-defined reorder points
- Create purchase requisitions and purchase orders to restock items
- Report on items received
- Define items for stocking in your storeroom
- Insert and maintain services that your company requisitions
- Manage information about the tools used to perform work
- Manage existing tools in storerooms
- Keep track of items (stocked, nonstocked, and special order items) and receive indications when stock falls below a specified reorder point so that you know when to reorder
- Perform issues, returns, and transfers
- Build a master list of condition codes for a particular item set
- Add and maintain information about storeroom locations, and view the items stocked within a storeroom
- [Item Master](#)  
You use the Item Master application to define items that are stocked in your storerooms. You group these items in an item set that can be shared by the organizations that use the item set.
- [Service items](#)  
You use the Service Items application to insert and maintain services that your company requisitions, either on a frequent or infrequent basis.

- [Tools](#)  
You use the Tools application to manage information about the tools used to perform work. Tools are typically nonconsumable items for which you charge an hourly rate for their use. Examples of tools include air compressors, nail guns, calibration equipment, and heavy equipment such as cranes and excavators.
- [Stocked Tools](#)  
You use the Stocked Tools application to manage existing tools in storerooms.
- [Inventory](#)  
You can use the Inventory application to store information about all aspects of inventory materials. You can monitor the storeroom balance of inventory items and tools. You can track the condition of items and the cost of inventory stock, and you can reorder items when stock must be replenished.
- [Count Books](#)  
You use the Count Books application to select inventory for periodic counting and to record the results of physical counts. You can then reconcile discrepancies between expected and actual quantities.
- [Inventory Usage](#)  
With the daily use of inventory items and tools, inventory materials must be moved between storerooms to supply the different areas of a site. You use the Inventory Usage application to create inventory usage records that track the issue, transfer, and return of inventory items within and across organizations.
- [Shipment Receiving](#)  
In a large organization, you can transfer inventory items or tools between storerooms within the same site or across sites and organizations and track their delivery. You create shipment receipt records to acknowledge the receipt of transferred items and update inventory balances at the destination storeroom.
- [Condition Codes](#)  
You use the Condition Codes application to build the master list of condition codes for a particular item set.
- [Storerooms](#)  
You use the Storerooms application to add and maintain information about storeroom locations, as well as view the items stocked within a storeroom. You also use this application to associate the general ledger accounts with each storeroom, define the lead time calculation for items in a storeroom, and flag the storeroom to function as an internal supplier to other storerooms.

---

## Item Master

You use the Item Master application to define items that are stocked in your storerooms. You group these items in an item set that can be shared by the organizations that use the item set.

When you create an item record, define the main attributes of the item (such as the commodity codes, the order, and issue units, whether an item is lotted, rotating, or condition-enabled). You can also specify any alternate items that you can use in its place and a list of the condition codes that you want applied to the item. The safety hazards and tax codes that you apply to an item are specific to a single organization.

Use the Item Master application to perform the following tasks for each item:

- Create condition-enabled items to track the value of an item as its condition changes.
- Create item kits that are collections of items that you issue as a single unit.
- Add items to one or more storerooms.
- Specify the safety hazards and tax codes that vary by organization.
- Specify items as consignment items that are considered part of the consignment inventory, and that are paid for when consumed.
- Specify items as tax-exempt.
- Specify the percentage of items that can be received over the amount ordered in the initial agreement.
- Define other information related to an item, such as vendors that carry the item, specifications for the item, and the parts needed to build an item assembly structure.
- Attach outside documents that relate to an item.
- [Items overview](#)  
When you work with the Items Master application, you work with rotating items, meters, meter groups, item kits, item assembly structures, and item statuses.
- [Working with master items](#)  
You can add item records, associate items with vendors, add specifications, create item structures, create condition-enabled structures, create item kits, and add alternate items. You can also change the status of the item, duplicate the item, specify organization details, and delete items.

---

## Items overview

When you work with the Items Master application, you work with rotating items, meters, meter groups, item kits, item assembly structures, and item statuses.

- [Rotating items](#)  
A rotating item is a serialized asset, such as a pump or a notebook, that you define with a common item number. You designate an item as rotating because it shares properties of both items and assets.
- [Item kits](#)  
An item kit is a group of items that are issued as a single unit. You can assemble an item kit and add the kit to a storeroom as a package of items.
- [Item assembly structures](#)  
An item assembly structure is a list of parts and subassemblies that you need to build an item or to define the requirements of a location. Use item assembly structures on rotating items and on items in a kit.
- [Item master statuses](#)  
You can manage the status of an item for all related records. A set of inheritance rules are used to apply changes to an item from a higher level to a lower level. A change to the item status is applied to the organization and to the inventory level. From the organization level, a status change is applied to the inventory level.
- [Stock category types](#)  
There are three stock category types: non-stocked (NS) items, special order (SP) items, and stocked (STK) items. Using stock category types helps you identify items for reorder and minimizes administration work when ordering occasionally used items.

- **Consignment items**  
Consignment items are owned by external vendors. The consignment items are located in a local storeroom, and are considered part of the consignment inventory. You can keep consignment items in your storeroom, and pay for those types of items when you use them.
- **Meters**  
You can create meters and associate meters with items. The associated asset or location record is updated with the quantity that was issued and decreases the storeroom balance of that item.
- **Meter groups**  
A meter group is a set of meters that you can apply to an asset record. Any meter group that is associated with the rotating item is automatically applied to any assets that are created for that item.
- **Tax-exempt status**  
The tax-exempt option indicates whether an item, a tool, or a service is taxable. You might want to set the tax-exempt status, depending on where an item or a service is acquired, and how an item or a service is used.

---

## Rotating items

A rotating item is a serialized asset, such as a pump or a notebook, that you define with a common item number. You designate an item as rotating because it shares properties of both items and assets.

A rotating item can have an inventory value and an issue cost. A rotating item is an inventory item with a generic item number, a current balance, and multiple instances that can be used in various locations around a plant. For example, you might track 10 individual five-horsepower pumps with the single item identifier PUMP-5HP.

A rotating item cannot be consumed, and is maintained as an asset. After creating an item and adding it to a storeroom, you can either use the Assets application to create the asset record for the item you want to track, or create a purchase order for the rotating item and serialize it when you receive it. When you associate an asset with a rotating item, balances can be displayed and tracked for the item. A rotating item is tracked both by its item number in Inventory records and by its asset number in Assets records. An item cannot be both a spare part and a rotating item.

---

## Example of a rotating item

10 notebooks of the same model share the same attributes. All 10 notebooks have the common item number FermionT23. To track each notebook as an individual asset, flag the items as rotating when you create them.

---

## Item kits

An item kit is a group of items that are issued as a single unit. You can assemble an item kit and add the kit to a storeroom as a package of items.

You use the Item tab of the Item Master application to create a kit record for an item. After you create a kit record for an item, you can define the structure of the kit using the Item Assembly Structure tab. You can specify the items that will make up the kit and the quantities of each item to be included.

You can preassemble item kits and issue them to work orders; all cost and balance information are updated on the kit inventory record. The individual items that make up a kit are considered part of the kit. The items are not tracked separately in inventory once you have assembled them into a kit. This means that balances for an item record do not include any instances of that item that are currently part of a kit. When you assemble a kit, the balance of the item kit record is increased, and the current available balance of the components used to construct the item kit is decreased.

Note: when you build the components of the kit, you cannot use items that are flagged as rotating, condition-enabled, or lotted.

The kit can be used to perform a specific task, such as routine maintenance. You can then issue an item kit to a work order using the single item kit record, instead of entering multiple, separate item records. The technicians on a work order use all the components within the kit to perform their work. They can also return any unused components back to a storeroom.

Use the Disassemble Kit action to break an item kit back into its respective components in inventory. Disassembling a kit decreases the balance of the item kit record and increases the balance of the individual kit components in the storeroom.

---

## Considerations when working with item kits

When working with item kits, the following rules apply:

- When adding a kit to a storeroom, if the component items do not exist in the storeroom, inventory records are created for these items.
- You cannot create item kits that contain condition-enabled, rotating, or lotted items.
- You cannot assemble or disassemble item kits across storerooms. You must gather or return items to a single storeroom location.
- You cannot assemble more kits than there are individual parts in the storeroom.

---

## Example of an item kit

A construction company writes several hundred work orders each year to maintain its paving equipment. Most of the jobs associated with the work orders require the same type of labor craft, bill of materials, and tools. If maintaining a steam roller always requires the same six items, create an item record and flag it as a kit. Use the Item Master application to define the list of component items and their quantities.

---

## Item assembly structures

An item assembly structure is a list of parts and subassemblies that you need to build an item or to define the requirements of a location. Use item assembly structures on rotating items and on items in a kit.

You can copy an item assembly structure. You can use the item assembly structure for an existing item as a template and copy it to another item record. If an existing item assembly structure is like what you need, you can save time when compared with creating another item assembly structure.

Specify the item assembly structure on an item record, and use the parent item number associated with the item assembly structure to identify it. While you can use any item as the top level of an item assembly structure, you can apply an item assembly structure to an asset or to an operating location only if you mark the parent item as a rotating item.

---

## Example of an item assembly structure

A five-horsepower motor and its constituent parts are used in 10 rotating asset subassembly structures in a plant. Rather than specifying the component parts on all 10 asset records, you can create the asset records and copy the five-horsepower motor item assembly structure to each record. The item assembly structure is applied to the asset subassembly structure and/or to the spare part. Similarly, you could copy the same item assembly structure to the 10 operating locations in the plant that require the motor and its parts. You can apply item assembly structures to asset and to location records within those respective applications.

---

## Item master statuses

You can manage the status of an item for all related records. A set of inheritance rules are used to apply changes to an item from a higher level to a lower level. A change to the item status is applied to the organization and to the inventory level. From the organization level, a status change is applied to the inventory level.

The following status types are available:

- Pending items are not available when you attempt to record selected general ledger transactions. Items that are in Pending status are not visible from item lookups. This status applies to the following general ledger transactions:
  - Material Use Transactions (MATUSETRANS)
  - Material Receipts Transactions (MATRECTRANS)
  - Inventory Transactions (INVTRANS) except for Insert Item (INSERTITEM)
- Planning items are not available when you attempt to record selected general ledger transactions. This status applies to the following general ledger transactions:
  - MATUSETRANS
  - MATRECTRANS (Issue, Transfer, or Receipt types, only)
- Active items are available without any restrictions.
- Pending Obsolescence items can be used, but cannot replenish existing balances.
- Obsolete items cannot be used in the system, except to generate invoices and for historical purposes. Items that are in Obsolete status are not visible when you are looking up items.

---

## Stock category types

There are three stock category types: non-stocked (NS) items, special order (SP) items, and stocked (STK) items. Using stock category types helps you identify items for reorder and minimizes administration work when ordering occasionally used items.

### Non-stocked (NS) items

Items that you do not stock on a regular basis, and that are not automatically reordered. Because an item is sometimes needed, retain the record for the item in the database. The record for the item is useful both for cost tracking purposes and for future reference. For example, the record contains the vendor's name, the price, or other pertinent item-specific information. A non-stocked item can include an item that is needed once a year for inspections, or an item that is stocked during certain seasons of the year. For example, air filters must be replaced once a year. You can keep the record of the item in your database for future replacements.

### Special order (SP) items

Items that you order only once, for an unexpected need or for a one-time work order. A special order item is not kept in stock. You do not need a permanent record of the item in your database. In most cases, after the item is received, you can delete the record for the special order item from the database.

### Stocked (STK) items

Items that you stock continually because they are frequently needed. A stocked item is the default value for an item added to a storeroom. Stocked items are included in the reorder process. Stocked items have a reorder criteria (for example, a reorder point and an economic order quantity) that is specific to each storeroom location.

---

## Consignment items

Consignment items are owned by external vendors. The consignment items are located in a local storeroom, and are considered part of the consignment inventory. You can keep consignment items in your storeroom, and pay for those types of items when you use them.

When you create an item, you can specify the item as a consignment item. Rotating items and condition-enabled items cannot be flagged as consignment items.

Invoices for consignment items are generated in any of the following ways:

### Consumption

An invoice is generated automatically when the item is consumed from the storeroom.

### Frequency

If invoices are based on a frequency, then the product-provided cron task (ConsignmentInvoiceCronTask) evaluates consignment items to be processed. The frequency and units specified for the inventory record are used to determine the next invoice date. The cron task is set to run daily, unless you specify another value. A single invoice that contains up to the maximum number of lines is created for each vendor. You use the Organizations application to set the maximum number of lines on consignment invoices.

#### Manual

You generate an invoice manually.

---

## Meters

You can create meters and associate meters with items. The associated asset or location record is updated with the quantity that was issued and decreases the storeroom balance of that item.

When you associate a meter with an item and issue the item to a work order, to an asset, or to a location, the associated asset or location record is updated with the quantity that was issued and decreases the storeroom balance of that item. This occurs only when the meter on the item matches the meter on the asset or on the location.

Meters can be of the following types:

- Continuous, such as gallons to date or running time meters.
- Gauge, such as temperature readings.
- Characteristic, such as a color or a vibration level.

---

## Example of a continuous meter

You can track fuel consumption for an asset. Define FUEL as a meter and GASOLINE as an item. Use the Item Master application to associate the meter FUEL with the item GASOLINE. When you issue fuel for an asset, such as for a truck, the balance of the fuel in the storeroom is decreased by the amount issued. Use the Meters tab in the Assets application to see that the amount of fuel issued to the truck increases by the amount specified.

---

## Meter groups

A meter group is a set of meters that you can apply to an asset record. Any meter group that is associated with the rotating item is automatically applied to any assets that are created for that item.

---

## Example of a meter group

A pump is a rotating item. On a pump, meters might track inlet pressure, outlet pressure, and vibrations. Meters are common to all pumps that share an item number. Instead of having to add these meters to each asset record created for a rotating item, create a meter group with this collection of pump-related meters and associate it with the rotating item. Each time you create an asset record for the pump, the meter group, and its meters are automatically associated with the asset record.

---

## Tax-exempt status

The tax-exempt option indicates whether an item, a tool, or a service is taxable. You might want to set the tax-exempt status, depending on where an item or a service is acquired, and how an item or a service is used.

The situations under which items or services are tax-exempt vary depending upon your location, and upon current tax regulations. For example, the storeroom for an item might be in a location where sales taxes are not collected. In some cases, if an item becomes part of a product, that item can be tax-exempt. If the item is used as a stand-alone item, then the item is taxable. The buyer for your organization determines the tax-exempt status of items, of tools, and of services.

You can override the tax-exempt status for items, for tools, and for services in the following applications:

- Purchase Requisitions
- Purchase Orders
- Invoices

When you specify the tax-exempt status, you can apply the status at the organization level and at the vendor level.

---

## Working with master items

You can add item records, associate items with vendors, add specifications, create item structures, create condition-enabled structures, create item kits, and add alternate items. You can also change the status of the item, duplicate the item, specify organization details, and delete items.

- [Creating item master records](#)  
You can create item records which identify items and contain information associated with items.
- [Creating item assembly structures](#)  
You can create item assembly structures that are lists of parts and subassemblies. A structure is needed to build an item or to define the requirements for a

location. Use item assembly structures on rotating items and on items in a kit. You can apply item assembly structures as a template when creating rotating asset records and location records.

- [Adding items to storerooms](#)

You can add items to a single storeroom or to multiple storerooms. An inventory record is created when you add an item to a storeroom.

- [Viewing contracts](#)

You can view the contracts that are associated with an item.

- [Specifying organization details for items](#)

You can specify organization details for items. You can group items in item sets, and multiple organizations can use the item sets. The safety hazards and tax codes that you apply to an item are specific to a single organization. You can also specify the tax-exempt status for the item at the organization level.

- [Creating item kits](#)

An item kit is a group of items that are issued as a single unit. You assemble an item kit and add it to a storeroom as one package of items that carries with it the required costing and balance information. You can define the items that comprise a kit.

- [Associating commodities with contracts](#)

You can associate commodity groups and codes to a contract record to add items for a sale or a purchase as part of the contract. Commodity groups and codes help you categorize and manage contracts and their items and products. You can search for contracts by commodity, report spending on a commodity, and track commodities supplied by specified vendors.

---

## Creating item master records

You can create item records which identify items and contain information associated with items.

### About this task

When creating an item record, list the parts that are used interchangeably with the item, and specify any condition codes for the item. You can choose to number items manually or have items automatically numbered.

The first time that you create an item, you can specify the percentage of items that can be received over the amount ordered in the initial agreement. The percentage value is applied to the organization level and to the vendor level. You can subsequently modify the receipt tolerance percentage in the Item/Organization Details window. You can also modify the receipt tolerance percentage in the Purchase Orders application.

### Procedure

1. On the toolbar of the Item Master application, click New Item.
2. If the Item field is empty, type a value, and add a description to the Description field.
3. In the Lot Type field, specify whether the item is lotted (LOT or NOLOT).
4. Optional: In the Receipt Tolerance % field, indicate the percentage of items that can be received over the amount specified on the initial agreement.
5. Specify additional fields as needed. An asterisk (\*) indicates a required field.
6. Click Save Item to add the item record to the database.

- [Adding alternate items](#)

You can add alternate items to an item record. You designate alternate items when you want to use inventory items interchangeably.

- [Associating items with vendors](#)

You can associate vendors with items to manage a list of vendors that supply an item.

- [Adding specifications to items](#)

You can add specifications that define an item.

---

## Adding alternate items

You can add alternate items to an item record. You designate alternate items when you want to use inventory items interchangeably.

### About this task

If you want two items to be alternates for each other, assign each as an alternate for the other. For example, you can assign two different brands of motor oil to be alternates for each other.

### Procedure

1. In the Item Master application, display the record to which you want to add an alternate item.
2. In the Alternate Items table window, click New Row to add an alternate item.
3. In the Item field, type a value or click Detail Menu to select an option and to retrieve an alternate item.
4. Enter additional fields as needed, and click Save Item to add the alternate item to the item record.

---

## Associating items with vendors

You can associate vendors with items to manage a list of vendors that supply an item.

## Before you begin

---

Create vendors using the Companies application, and store vendors at the organization level. The list of available vendors is filtered to show only those vendors that are created for the organization and the company set to which you belong. Create a list that includes vendors from whom you have already ordered, as well as vendors that you have not used. You can then use the historical vendor data to compare vendor prices and delivery information.

## About this task

---

You can specify whether a vendor is the default vendor for the item in the organization. You can change the vendor on the work plan or the requisition. Each item in an organization can have one default vendor. You can also specify whether an item is tax-exempt.

## Procedure

---

1. From the List tab of the Item Master application, display the item record with which you want to associate a vendor.
2. Click the Vendors tab to display the vendors that stock the item.
3. In the Vendors window, click New Row.
4. In the Vendor field, type a value.
5. In the Promised Lead Time (Days) field, specify the number of days it takes the vendor to supply the item.
6. Enter additional fields as needed. An asterisk (\*) indicates a required field.
7. Optional: Select the Default Vendor check box if the vendor is the default vendor for this item. If you select the Default Vendor check box, when you add the item to a work plan as a direct issue item or create a requisition for the item, the information for the default vendor and details about the item (such as make, model, catalog code, and unit cost) are copied to the requisition.
8. Optional: Select the Tax Exempt check box if you want the item to be tax-exempt.
9. Optional: Click New Row to specify additional vendors.
10. Click Save Item to associate the vendors to the item record.

---

## Adding specifications to items

You can add specifications that define an item.

## About this task

---

Use the Specifications tab to classify an item and to apply the template that is associated with the classification you used. Specification templates contain attributes about an item, such as the size, the speed, the material, and the capacity. Use this list of attributes to define specific information about an item, making it easier to distinguish an item from a similar item.

## Procedure

---

1. Use the Item Master application to display the item record to which you want to add specifications.
2. Click the Specifications tab, and in the Classification field, click Detail Menu and then Classify to select a classification path for the item.
3. In the Alphanumeric field or in the Numeric field, type a value.
4. In the Unit of Measure field, type a value or click Select Value to retrieve the unit of measure used to express the attribute. For example, if the attribute is SPEED, the unit of measure can be HP (horsepower).
5. Click Save Item to associate the specification values with the record for the item. If you need to change the specifications for an item, either reclassify the item using the Classification field or change the values in the Specifications table.

---

## Creating item assembly structures

You can create item assembly structures that are lists of parts and subassemblies. A structure is needed to build an item or to define the requirements for a location. Use item assembly structures on rotating items and on items in a kit. You can apply item assembly structures as a template when creating rotating asset records and location records.

## About this task

---

When you create an item assembly structure for an item, the following rules apply:

- If the parent item is a rotating item, add either rotating or non-rotating items to the item assembly structure.
- If the parent item is a non-rotating item, add other non-rotating items only to the item assembly structure. Rotating items cannot be added to the item assembly structure if the parent item is not a rotating item.
- If a rotating item is applied to an item assembly structure, any child rotating items become part of the parent rotating item and do not have their own inventory balance.
- If the item assembly structure is for an item kit, do not include rotating items or condition-enabled items.

## Procedure

---

1. From the List tab of the Item Master application, display the item record for which you want to create an item assembly structure.
2. From the Item Assembly Structure tab, click New Row to open the Children window.

3. In the Item field, specify a value.
4. Optional: Change the number in the Quantity field.
5. Optional: Type remarks for this item in the Remarks field.
6. Optional: Click New Row to add another item.
7. Click Save Item to associate the item assembly structure with the item record.

## What to do next

By using the Move To action to change the Current Level item, you can also traverse up and down the hierarchy, viewing item assembly structures that are nested within other item assembly structures. The Children window shows the item assembly structure of the item listed as the current item. The Move To action does not work unless an item has an item assembly structure associated with it.

- [Viewing nested item assembly structures](#)

You can change the Current® Level item and traverse up and down the hierarchy, viewing item assembly structures that are nested within other item assembly structures. The Children window shows the item assembly structures for the item listed as the current item.

## Viewing nested item assembly structures

You can change the Current® Level item and traverse up and down the hierarchy, viewing item assembly structures that are nested within other item assembly structures. The Children window shows the item assembly structures for the item listed as the current item.

## Before you begin

The Move To action does not work unless an item has an item assembly structure associated with it.

## Procedure

1. From the List tab of the Item Master application, display the item record for which you want to view nested item assembly structures.
2. From the Item Assembly Structure tab, click View Details to expand the row.
3. In the Item field, click Detail Menu and select Move To. The item moves to the Current Level field, and the children display in the table.
4. The Belongs To field indicates the item to which the current item belongs. To move back up the hierarchy, click Detail Menu in the Belongs To field, and select Move To. The parent moves up to the Current Item field, and its children display in the table.

## Adding items to storerooms

You can add items to a single storeroom or to multiple storerooms. An inventory record is created when you add an item to a storeroom.

## About this task

To track the balance for the item, specify the unit of measure that is used for issuing the item. When you add an item to a storeroom, the inventory control account, the shrinkage cost account, and the inventory cost adjustment account default to the values that are specified in the storeroom record. For consignment items, the account values that are specified in the company record for the consignment vendor are used. Use the Inventory application to show these account fields and to edit them on the inventory record so that you can make the accounts specific to an item and to a location.

In the Organizations application, in the Item Options dialog box, an administrator can limit the number of items that can be created in the inventory at once.

## Procedure

1. In the Item Master application, select an item or items.
2. Add items to a storeroom or storerooms:

Option	Steps
Add items to a single storeroom.	<ol style="list-style-type: none"><li>a. Select the Add Items To Storeroom action.</li><li>b. Optionally, change the Site for the storeroom.</li><li>c. In the Storeroom field, specify a value, and click OK.</li><li>d. In the second dialog box that opens, specify an issue unit and issue cost type for each item.</li><li>e. If the Item is a consignment type of item, expand the Details section for the item, and select the <b>Consignment</b> check box.<ul style="list-style-type: none"><li>• In the <b>Consignment Vendor</b> field, specify the company that provides the item that invoices are generated for.</li><li>• In the <b>Invoice Generation Type</b> field, specify the type of invoice to be generated. If you select FREQUENCY as the invoice type, specify a value for the frequency, and a value for the frequency units. If values for the frequency and frequency units are specified, the next invoice date defaults to the current date and time. You can select a different date for the next invoice date.</li></ul></li></ol>
Add items to multiple storerooms.	<ol style="list-style-type: none"><li>a. Select the Add Items to Multiple Storerooms action.</li><li>b. Specify a site or, if your organization configured storeroom hierarchies, specify the top storeroom in the hierarchy.</li><li>c. Click Refresh, select the storerooms that you want to add the items to, and click OK.</li><li>d. In the second dialog box that opens, specify default values for the selected storerooms and click Apply to Selected.</li><li>e. Optionally, select the Run Storeroom Update in the Background check box and specify an email. When inventory records are created in the background, you can continue to work in the user interface and receive an email when the creation is complete.</li></ol>

3. Click OK to create the inventory records.

---

## Viewing contracts

You can view the contracts that are associated with an item.

### Procedure

---

1. From the List tab of the Item Master application, display the item record whose contracts you want to view.
2. On the Vendors tab, select the View Contracts action.
3. Use the Filter area to narrow the list of contracts that you want to display in the table. For example, specify a contract number, a contract type, or a status and then click Filter Table.
4. Click OK when you are done viewing the contracts.

---

## Specifying organization details for items

You can specify organization details for items. You can group items in item sets, and multiple organizations can use the item sets. The safety hazards and tax codes that you apply to an item are specific to a single organization. You can also specify the tax-exempt status for the item at the organization level.

### Before you begin

---

After creating an item, use the Item Master application to add, to view, to modify, or to delete the information that applies to an organization.

### Procedure

---

1. From the List tab of the Item Master application, select the item to which you want to add organizational details.
2. Click the Item tab to view the record for the item that you selected.
3. Select the Item/Organization Details action.
4. In the Items/Organization Details window, select the organization to which you want to add organizational details.
5. Optional: Add a safety hazard.
6. Optional: Add a tax code.
7. Optional: Specify whether the item is tax-exempt.
8. Optional: Modify the percentage of items that can be received over the quantity ordered. The receipt tolerance percentage value was set when the item record was created.
9. Click OK and click Save Item.

---

## Creating item kits

An item kit is a group of items that are issued as a single unit. You assemble an item kit and add it to a storeroom as one package of items that carries with it the required costing and balance information. You can define the items that comprise a kit.

### Procedure

---

1. On the toolbar of the Item Master application, click New Item.
2. On the Item tab, specify a value, and type a description.
3. Select the Kit check box to indicate that this item is a kit.
4. Enter additional fields as needed. An asterisk (\*) indicates a required field.
5. To add items to the kit, from the Item Assembly Structure tab, click New Row to open the Children window.
6. In the Item field, type a value. You can only add items that are not condition-enabled, rotating, or lotted.
7. Optional: Change the number in the Quantity field.
8. Optional: Type remarks for this item in the Remarks field.
9. Optional: Click New Row to add another item.
10. Click Save Item to add the new item record to the database.

---

## Associating commodities with contracts

You can associate commodity groups and codes to a contract record to add items for a sale or a purchase as part of the contract. Commodity groups and codes help you categorize and manage contracts and their items and products. You can search for contracts by commodity, report spending on a commodity, and track commodities supplied by specified vendors.

### About this task

---

You can associate or remove any commodities on a contract that has a waiting for approval (WAPPR) or draft (DRAFT) status.

## Procedure

---

1. In a contract application, display the record that you want to update.
2. Select the Associate Commodities action.
3. In the Commodity Groups table window, click Select Commodity Groups.
4. Choose the commodity groups by selecting the corresponding Commodity Group check boxes.
5. Click OK.  
The selected commodity groups are added in the Commodity Groups table window.
6. In the Commodity Codes for Commodity Group table window, click Select Commodity Codes.
7. Choose the commodity codes by selecting the corresponding Commodity Codes check boxes.
8. Click OK.  
The selected commodity codes are added in the Commodity Codes for Commodity Group table window.
9. Click OK to close the Associate Commodities window.

---

## Service items

You use the Service Items application to insert and maintain services that your company requisitions, either on a frequent or infrequent basis.

The Service Items application allows you to create service item records and to view or manage a list of vendor companies that supply the service item.

- [Service items overview](#)  
Service items are services that your company requisitions, such as grounds maintenance or plant security. You can prorate service items, set status for service items, create measurement units, and maintain service items as part of the item set.
- [Working with service items](#)  
You can create service items, associate general ledger accounts with service items, change the status of a service item, view a service item on a work order, and create units of measurement.

---

## Service items overview

Service items are services that your company requisitions, such as grounds maintenance or plant security. You can prorate service items, set status for service items, create measurement units, and maintain service items as part of the item set.

- [Prorated service items](#)  
Adding service items to the cost of a particular item increases the stocked item average cost. To avoid this increase, you can add the service item to issue on receipt items only.
- [Service item statuses](#)  
You can manage the status for a service item for all related records. The system uses a set of inheritance rules to apply changes to a service item from a higher level to a lower level. In the Service Item application, a change to a service item status is applied to the organization level.
- [Tax-exempt status](#)  
The tax-exempt option indicates whether an item, a tool, or a service is taxable. You might want to set the tax-exempt status, depending on where an item or a service is acquired, and how an item or a service is used.
- [Measurement units and conversion factors](#)  
A unit of measure describes the quantity used to measure an item, tool, or a service. You use a unit of measure to measure the items and services that you order, issue, and transfer. Examples of units of measure include EACH, CASE, IN (inches), and ROLL.
- [Item sets](#)  
Item sets let multiple organizations within a company view and choose from a common set of items stocked in the storeroom. An organization can be associated with only one item set. However, multiple organizations can use the same item set.

---

## Prorated service items

Adding service items to the cost of a particular item increases the stocked item average cost. To avoid this increase, you can add the service item to issue on receipt items only.

Items issued directly to a work order, general ledger account, location, or asset have the service item added to the cost of the individual item only.

This option is set up in the Organizations application.

---

## Service item statuses

You can manage the status for a service item for all related records. The system uses a set of inheritance rules to apply changes to a service item from a higher level to a lower level. In the Service Item application, a change to a service item status is applied to the organization level.

The following status types are available:

- **Pending** - Service items are not available when you try to record selected general ledger transactions. Service items in pending status are not visible from service item lookups. This status applies to the following general ledger transactions: material use (MATUSETRANS), material receipts (MATRECTRANS), inventory (INVTRANS), except for insert item (INSERTITEM).
- **Planning** - Service items are not available when you try to record selected general ledger transactions. This status applies to the following general ledger transactions: material use (MATUSETRANS), material receipts (MATRECTRANS) for issue, transfer, or receipt types, only.
- **Active** - These service items are available for full system capabilities.
- **Pending Obsolescence** - You can use any existing service items, but cannot replenish existing balances.
- **Obsolete** - You cannot use these service items, except to generate invoices. Obsolete items are not visible from service item lookups.

---

## Tax-exempt status

The tax-exempt option indicates whether an item, a tool, or a service is taxable. You might want to set the tax-exempt status, depending on where an item or a service is acquired, and how an item or a service is used.

The situations under which items or services are tax-exempt vary depending upon your location, and upon current tax regulations. For example, the storeroom for an item might be in a location where sales taxes are not collected. In some cases, if an item becomes part of a product, that item can be tax-exempt. If the item is used as a stand-alone item, then the item is taxable. The buyer for your organization determines the tax-exempt status of items, of tools, and of services.

You can override the tax-exempt status for items, for tools, and for services in the following applications:

- Purchase Requisitions
- Purchase Orders
- Invoices

When you specify the tax-exempt status, you can apply the status at the organization level and at the vendor level.

---

## Measurement units and conversion factors

A unit of measure describes the quantity used to measure an item, tool, or a service. You use a unit of measure to measure the items and services that you order, issue, and transfer. Examples of units of measure include EACH, CASE, IN (inches), and ROLL.

A conversion factor represents the numeric value or ratio that is used to relate one unit of measure to another. The conversion factor is an alternate value that is used to represent a unit of measure. You can use this alternate value to define an item order or transfer quantity and storeroom balance.

Before adding items to storerooms, you must first define the of units of measure, and then define the conversion ratios for those units. You can delete a unit of measure only when the asset management system is not using it in a conversion, on a specification template, or on a meter record. You can delete a conversion factor at any time. If a transaction is processed that used the conversion you deleted, you are prompted to enter a new conversion to finish the transaction.

You can add and modify units of measure and conversion factors in the following applications:

- Purchase Orders
- Purchase Requisitions
- Receiving
- Item Master
- Service Items
- Tools
- Stocked Tools
- Inventory

---

## Example of conversion factor use

When you receive an item, the system takes the received order unit value along with the storeroom issue unit and checks for an existing conversion. When all receipt lines pass validation, the system receives the items and adjusts the storeroom balances accordingly. If an item does not exist in the receiving storeroom, the system creates an inventory record for the item and sets the issue unit equal to the received unit.

You order light bulbs in bulk and the unit of measure is a case, with a quantity received of 36. However, when you issue the item, you issue it one at a time. In this case, you can define a measure unit of CASE and another measure unit of EACH. You define a conversion ratio from CASE to EACH with a factor of 36. When you receive an order of bulbs into a storeroom, the received order unit of one CASE is converted into the storeroom issue unit of 36 EACH.

---

## Item sets

Item sets let multiple organizations within a company view and choose from a common set of items stocked in the storeroom. An organization can be associated with only one item set. However, multiple organizations can use the same item set.

You identify an item set with a unique name or number, and each item that belongs to the item set has a unique item number.

When you create an organization, you associate an item set to it. When you create an item, by default the item is placed into the item set associated with the organization for your default insert site.

---

## Working with service items

You can create service items, associate general ledger accounts with service items, change the status of a service item, view a service item on a work order, and create units of measurement.

- **[Creating service items](#)**  
You use the Service Items application to create a service item record. A service item record identifies the item, lets you associate information with an item, and view or manage a list of vendor companies that supply service items.
- **[Specifying organization details for service items](#)**  
You can specify organization details for service items. Typically, general ledger accounts and tax codes are specific to a single organization. In the Service Items application, you can identify the default general ledger account used in the purchasing process for this service, if no other charging entity is specified (such as a work order, a location, and so on).
- **[Changing the status of service items](#)**  
The status of a service item can help you implement and enforce policies related to record creation and modification. You can change the status of a service item and apply that change to its dependent records.
- **[Reordering direct issue items and services](#)**  
You can reorder direct issue items and services that are listed on approved work orders and are issued without being received into inventory.
- **[Creating units of measure](#)**  
You can create a unit of measure to describe the quantity used to measure an item, tool, or a service. You use a unit of measure to measure the items and services that you order, issue, and transfer in the asset management system. Examples of units of measure include EACH, CASE, IN (inches), and ROLL.
- **[Creating conversion factors](#)**  
You can create a conversion factor to define the numeric value or ratio that the asset management system uses to relate one unit of measure to another. The conversion factor is an alternate value that is used to represent a unit of measure. You can use this alternate value to define an item order or transfer quantity and storeroom balance.
- **[Creating commodity groups](#)**  
You can create a commodity group to identify a grouping of items, tools, or services. A commodity group contains a grouping of individual commodity codes. Classifying items, tools, services with commodity groups and commodity codes provides a way for you to analyze spending by product type. You first define a commodity group and then add and associate individual commodity codes to the group.
- **[Copying service items](#)**  
You can use the Duplicate Service Item action to create a copy of an existing service item. Once you copy a service item, you can then change it as needed.

---

## Creating service items

You use the Service Items application to create a service item record. A service item record identifies the item, lets you associate information with an item, and view or manage a list of vendor companies that supply service items.

---

### Procedure

1. In the Service Items application, click the New Service Item icon.
2. Enter information in the Service Item field, Description field, Commodity Group field, and Commodity Code field.
3. Optional: If the service item is not taxable, select the Tax Exempt check box. The buyer for your organization determines the tax-exempt status of service items.
4. Optional: In the Receipt Tolerance % field, specify the percentage of service items that can be received over the amount ordered in the initial agreement. The percentage value is applied to the organization level and to the vendor level.
5. Optional: If you want to prorate the cost of the service item on purchase requisitions, purchase orders, and invoice lines, select the Prorate check box. You can add costs only to items that are issued on receipt.
6. Optional: If you want to require an inspection of the service item, select the Inspection Required check box.
7. In the Vendor field, select a value.
8. Optional: Complete additional fields.
9. Save your changes.

---

## Specifying organization details for service items

You can specify organization details for service items. Typically, general ledger accounts and tax codes are specific to a single organization. In the Service Items application, you can identify the default general ledger account used in the purchasing process for this service, if no other charging entity is specified (such as a work order, a location, and so on).

---

### Before you begin

After creating an item, use the Service Items application to add, to view, to modify, or to delete the information that applies to an organization.

---

### Procedure

1. On the List tab of the Service Items application, display the service item to which you want to add organizational details.
2. Click the Service tab.
3. Select the Service Item/Organization Details action.
4. In the Service Item/Organization Details window, specify the general ledger account for the service item.

5. Enter the tax code associated with the service item and organization.
6. Optional: Specify whether the service item is tax-exempt.
7. Optional: Modify the percentage value of service items that can be received over the quantity ordered. The percentage value was set when the service item record was created.
8. Click OK to enter or update the service item.

---

## Changing the status of service items

The status of a service item can help you implement and enforce policies related to record creation and modification. You can change the status of a service item and apply that change to its dependent records.

---

### Procedure

1. In the Service Items application, select the service item for which you want to change the status.
2. Click Change Status. The statuses that are available depend on the status of the service item.
3. Optional: If you want the system to pass the status change to dependent records, select the Roll New Status to Organizations check box. By default, this check box is not selected unless you choose obsolete status.
4. Click OK to change the status.

---

## Reordering direct issue items and services

You can reorder direct issue items and services that are listed on approved work orders and are issued without being received into inventory.

---

### Procedure

1. In the Service Items application, display the direct issue item or service that you want to reorder.
2. Click the Service tab.
3. Select the Reorder > Reorder Direct Issue Items/Svcs action.
4. Optional: In the Reorder Direct Issue Items and Services window, select one of the following options:
  - Select the Consider Contracts When Creating PRs/POs check box for existing contracts to be considered when deciding reorder vendors and price.
  - In the Additional Lead Time (Days) field, enter a value.
5. Click one of the following options:

Option	Description
Run Reorder	<ul style="list-style-type: none"><li>• In the Reorder Results window, you view information about the number of items ordered and the purchase order and purchase requisition identifiers of the new purchasing records.</li><li>• Optional: You can run a report or reorder items.</li></ul>
Preview	<ul style="list-style-type: none"><li>• In the Reorder Items Detail window, you view order details for the items that you are reordering and edit order amounts.</li></ul>

6. Click OK.
- [Viewing items or services for approved work orders](#)  
You can view items or services that are listed on approved work orders and are issued without being received into Inventory.

---

## Viewing items or services for approved work orders

You can view items or services that are listed on approved work orders and are issued without being received into Inventory.

---

### Procedure

1. In the Service Items application, display the service item that you want to view.
2. Click the Service tab.
3. Select the Reorder > Reorder Direct Issue Items/Svcs action.
4. In the Reorder Direct Issue Items and Services window, click Preview.  
You can view order details for the items that you are reordering. You also can edit order amounts, run a report, or reorder items from this window.
5. Optional: Clear the Run in Background Mode check box and click Run Reorder.
6. Click OK.

---

## Creating units of measure

You can create a unit of measure to describe the quantity used to measure an item, tool, or a service. You use a unit of measure to measure the items and services that you order, issue, and transfer in the asset management system. Examples of units of measure include EACH, CASE, IN (inches), and ROLL.

---

### About this task

A unit of measure works with a conversion factor. The conversion factor represents the numeric value or ratio that the asset management system uses to relate one unit of measure to another. You can create units of measure and conversion factors in many applications:

- Assets
- Purchase Orders
- Purchase Requisitions
- Receiving
- Item Master
- Meters
- Service Items
- Tools
- Stocked Tools
- Inventory

You can delete a unit of measure only when it is not used in a conversion, on a specification template, or on a meter record.

## Procedure

1. Open an application.
2. Select the Unit of Measure and Conversion > Add/Modify Units of Measure action.
3. Insert a row.
4. In the Unit of Measure field, specify an identifier for the unit of measure.
5. Optional: Enter values in the following fields:
  - Abbreviation
  - DescriptionThe abbreviation value along with an asset classification is used to create descriptions for assets, locations, and items.
6. Click OK.

## Creating conversion factors

You can create a conversion factor to define the numeric value or ratio that the asset management system uses to relate one unit of measure to another. The conversion factor is an alternate value that is used to represent a unit of measure. You can use this alternate value to define an item order or transfer quantity and storeroom balance.

## Before you begin

You must define the units of measure before you can create conversion ratios.

## About this task

You can create units of measure and conversion factors in the following applications:

- Purchase Orders
- Purchase Requisitions
- Receiving
- Item Master
- Service Items
- Tools
- Stocked Tools
- Inventory

## Procedure

1. Open an application.
  2. Select the Unit of Measure and Conversion > Add/Modify Conversions action.
  3. Click New Row.
  4. Enter values in the following fields:
- | Option                      | Description                                                                                           |
|-----------------------------|-------------------------------------------------------------------------------------------------------|
| <b>From Unit of Measure</b> | The original unit of measure value that you are converting from in the conversion factor calculation. |
| <b>To Unit of Measure</b>   | The unit of measure value that you are changing or replacing in the conversion factor calculation.    |
| <b>Conversion Factor</b>    | The ratio that is applied to relate one unit of measure to another.                                   |
5. Optional: In the Item Number field, enter the item number that is associated to the conversion.
  6. Click OK.

## Creating commodity groups

You can create a commodity group to identify a grouping of items, tools, or services. A commodity group contains a grouping of individual commodity codes. Classifying items, tools, services with commodity groups and commodity codes provides a way for you to analyze spending by product type. You first define a commodity group and then add and associate individual commodity codes to the group.

## About this task

Once you have defined commodities you can associate them with company, contract, and item records. You can also associate commodities with individual purchase order or requisition lines for items, service items, or tools that do not have commodity codes assigned to them, including special order materials or services.

You can create commodity groups and codes in the following asset management system applications:

- Companies
- Item Master
- Purchase Orders
- Service Items
- Tools

## Procedure

1. Open an application.
2. Select the Add/Modify Commodity Codes action.
3. In the Commodity Groups table window, click New Row.
4. In the Commodity Group field, enter an identifier for the commodity group.
5. Specify whether you want a service type item or service level agreement to use this commodity group.

Option	Service
Use commodity group	Selected
Do not use commodity group	Cleared

6. In the Commodity Codes for Commodity Group table window, click New Row.
7. In the Commodity Code field, enter an identifier for the commodity.
8. Specify whether you want a service type item or service level agreement to use this commodity code.

Option	Service
Use commodity code	Selected
Do not use commodity code	Cleared

9. Click OK.

## Copying service items

You can use the Duplicate Service Item action to create a copy of an existing service item. Once you copy a service item, you can then change it as needed.

## Procedure

1. In the Service Items application, display the service item that you want to copy.
2. Click the Service tab.
3. Select the Duplicate Service Item action to copy the service item.

## Tools

You use the Tools application to manage information about the tools used to perform work. Tools are typically nonconsumable items for which you charge an hourly rate for their use. Examples of tools include air compressors, nail guns, calibration equipment, and heavy equipment such as cranes and excavators.

When you create a tool record, you define the main attributes of the tool (such as commodity codes, issue unit, whether the tool is lotted or rotating), along with any alternate tools that can be used in its place and a list of the qualifications necessary for a person to use the tool. All tools are marked as capitalized.

Tools are defined at the Item set level, so several organizations can share a tool set. Some of the data on a tool record can be specific to an organization or site. For example, the storerooms for a tool are managed at the site level. Vendors for a tool are managed at the organization level.

In the Tools application, you can perform the following tasks:

- Catalog tools in an item set, which can then be shared by organizations that use the item set.
- Add the tool to one or more storerooms.
- Use the tool on job plans and work orders (when you use a tool on a work order, the tool can be reserved in the specified storeroom).
- Issue, receive, and transfer tools from storerooms.
- Specify the tool rate, general ledger accounts, associated vendor, tax-exempt status, and tax codes that vary by organization.
- Specify the percentage of tools that can be received over the quantity ordered in the initial agreement. The percentage value is applied to the organization level and to the vendor level when the tool record is created.
- Add a list of vendors that carry the tool.
- List the specification for the tool.
- Copy or delete a tool.
- Attach external documents that relate to the tool.

- **Tools overview**

When managing tools, you need to have an understanding of tool statuses and rotating tools.

- [Working with tools](#)

Tool records are a type of item record, so they can be managed in the same way that items are managed. They can be tracked in inventory, reserved in storerooms, charged to work orders, and so on. Tools can be owned by your company or leased from a vendor.

---

## Tools overview

When managing tools, you need to have an understanding of tool statuses and rotating tools.

- [Tool statuses](#)

You can manage a tool's status for all related records. A set of inheritance rules is used to apply status changes from a higher level to a lower level.

- [Rotating tools](#)

A rotating tool is an individual serialized asset, such as a nail gun or back hoe, that is defined by a common tool number. You mark a tool as rotating because it shares the same properties as an asset and you want to track each instance of that tool as an asset to monitor maintenance costs, downtime, etc.

- [Tax-exempt status](#)

The tax-exempt option indicates whether an item, a tool, or a service is taxable. You might want to set the tax-exempt status, depending on where an item or a service is acquired, and how an item or a service is used.

---

## Related tasks

- [Working with tools](#)

---

## Tool statuses

You can manage a tool's status for all related records. A set of inheritance rules is used to apply status changes from a higher level to a lower level.

In the Tools application, a tool status change is applied to the organization level. From the organization level, a status change is applied to the inventory level.

The following list describes tool statuses:

- Pending - Pending items are not available when you try to record selected general ledger transactions, and are not visible from tool lookups. This status applies to the following general ledger transactions:
  - Material use transactions (MATUSETRANS)
  - Material receipts transactions (MATRECTRANS)
  - Inventory transactions (INVTRANS), except for insert item (INSERTITEM)
- Planning - Planning items are not available when you try to record selected general ledger transactions. This status applies to the following general ledger transactions:
  - Material use transactions
  - Material receipts transactions (only issue, transfer, or receipt types)
- Active - Active items are available without restrictions.
- Pending obsolescence - This status indicates that you can use existing items, but cannot replenish existing balances.
- Obsolete - You can use obsolete items only to generate invoices. Obsolete items are not visible from tool lookups.

---

## Rotating tools

A rotating tool is an individual serialized asset, such as a nail gun or back hoe, that is defined by a common tool number. You mark a tool as rotating because it shares the same properties as an asset and you want to track each instance of that tool as an asset to monitor maintenance costs, downtime, etc.

For example, you may have ten air compressors of the same model that share the same attributes, and they are all known by the common tool number Fermion-AC23. However, you want to be able to track each one as an individual asset, so you mark the tool as rotating.

After creating the tool and adding it to a storeroom, you can either use the Assets application to create the asset records for each individual tool you wish to track, or create a purchase order for the rotating tool and serialize it when you receive it. Once you have associated an asset to a rotating tool, the system can display and track balances for this tool. A rotating tool is tracked both by its tool number in Stocked Tool records and by its unique asset number in Assets records.

---

## Tax-exempt status

The tax-exempt option indicates whether an item, a tool, or a service is taxable. You might want to set the tax-exempt status, depending on where an item or a service is acquired, and how an item or a service is used.

The situations under which items or services are tax-exempt vary depending upon your location, and upon current tax regulations. For example, the storeroom for an item might be in a location where sales taxes are not collected. In some cases, if an item becomes part of a product, that item can be tax-exempt. If the item is used as a stand-alone item, then the item is taxable. The buyer for your organization determines the tax-exempt status of items, of tools, and of services.

You can override the tax-exempt status for items, for tools, and for services in the following applications:

- Purchase Requisitions
- Purchase Orders

- [Invoices](#)

When you specify the tax-exempt status, you can apply the status at the organization level and at the vendor level.

---

## Working with tools

Tool records are a type of item record, so they can be managed in the same way that items are managed. They can be tracked in inventory, reserved in storerooms, charged to work orders, and so on. Tools can be owned by your company or leased from a vendor.

- [Adding tools](#)  
A tool record defines a tool and allows you to associate information with the tool. Tools are used to perform work, such as building, maintenance, and repairs.
- [Adding tools to storerooms](#)  
When you add a tool to a storeroom, you can indicate that the tool is stored at this location. Tool balances are tracked in the Stocked Tools application.
- [Associating vendors with tools](#)  
To manage a list of vendors that supply tools, you can associate vendors with specific tools.
- [Changing the status of tools](#)  
Tool item statuses allow you to implement and enforce policies related to record creation and modification.
- [Changing the organization details of tools](#)  
Tools are grouped into item sets that multiple organizations can use. However, the hourly tool rates, general ledger accounts, and tax codes that you apply to a tool are specific to a single organization.
- [Copying tool records](#)  
If you need to create a tool that has similar attributes to another tool that exists, you can copy the existing tool record and reuse information as needed.
- [Creating units of measure](#)  
You can create a unit of measure to describe the quantity used to measure an item, tool, or a service. You use a unit of measure to measure the items and services that you order, issue, and transfer in the asset management system. Examples of units of measure include EACH, CASE, IN (inches), and ROLL.
- [Creating commodity groups](#)  
You can create a commodity group to identify a grouping of items, tools, or services. A commodity group contains a grouping of individual commodity codes. Classifying items, tools, services with commodity groups and commodity codes provides a way for you to analyze spending by product type. You first define a commodity group and then add and associate individual commodity codes to the group.

## Adding tools

A tool record defines a tool and allows you to associate information with the tool. Tools are used to perform work, such as building, maintenance, and repairs.

---

## About this task

When you add a tool record, you can list other tools that are interchangeable with this tool and qualifications that a person needs to use the tool.

---

## Procedure

1. In the Tools application, click New Tool.
  2. Optional: If the Tool field is blank, enter a value.
  3. Enter an item description and lot type.
  4. Optional: Complete the remaining fields to further define the tool.
  5. Save your changes.
- [Adding alternate tools](#)  
You can add alternate tools to a tool record. You can add a list of alternate tools that can be used to perform the same work if a shortage of a particular tool were to occur.
  - [Adding qualifications for tools](#)  
You can add qualifications to a tool record if there are certain skills or certifications that a person needs to use the tool.
  - [Classifying tools](#)  
You can classify tools to make it easier to distinguish a tool from similar tools. Attributes that you can use include size, speed, material, and capacity.

---

## Adding alternate tools

You can add alternate tools to a tool record. You can add a list of alternate tools that can be used to perform the same work if a shortage of a particular tool were to occur.

---

## About this task

If you want two tools to be alternates for each other, you must assign each as an alternate for the other.

## Procedure

---

1. In the Tools application, open an existing tool record.
2. On the Tool tab, insert a row.
3. In the Tool field, specify a value.
4. Save your changes.

---

## Adding qualifications for tools

You can add qualifications to a tool record if there are certain skills or certifications that a person needs to use the tool.

### Before you begin

---

You create qualifications in the Qualifications application, and store qualifications at the organization level.

## Procedure

---

1. In the Tools application, open a tool record.
2. From the Tool tab, click New Row.
3. In the Qualification field, specify a qualification.
4. Save your changes.

---

## Classifying tools

You can classify tools to make it easier to distinguish a tool from similar tools. Attributes that you can use include size, speed, material, and capacity.

### About this task

---

Classifying tools also helps you search for them quickly. If you do not remember a tool number, you can use a classifications search. While working with work orders, job plans, and on purchasing lines, you can use the Detail Menu in the Tool field to view classifications, attributes, and associated tools.

## Procedure

---

1. In the Tools application, open a tool record.
2. Click the Specifications tab.
3. In the Classifications field, click Detail Menu and then Classify to select a classification path for the tool.
4. In the Alphanumeric field or Numeric field, specify a value for the tool.
5. Specify a value for the measure unit used to express the attribute.  
For example, if the attribute is SPEED, the unit of measure can be MPH, for miles per hour.
6. Save your changes.

### What to do next

---

If you need to change a tool's specification, reclassify the tool from the Classification field or change the values in the Specifications table.

---

## Adding tools to storerooms

When you add a tool to a storeroom, you can indicate that the tool is stored at this location. Tool balances are tracked in the Stocked Tools application.

### About this task

---

To track the balance of a tool, you must specify the unit of measure in which the tool is issued.

## Procedure

---

1. In the Tools application, select a tool.
2. Select the Add Tools To Storeroom action.
3. In the Storeroom field, specify a storeroom location.
4. Optional: Change the site for the storeroom.
5. Click OK.
6. Optional: Specify a default bin, current balance, and issue unit.
7. Click OK.

---

## Associating vendors with tools

To manage a list of vendors that supply tools, you can associate vendors with specific tools.

### Procedure

---

1. In the Tools application, open a tool record.
2. Click the Vendors tab to display the vendors that stock the tool.
3. In the Vendors table window, insert a row and specify a vendor.
4. In the Promised Lead Time (Days) field, enter the number of days it takes the vendor to supply the tool.
5. Optional: Complete the remaining fields to further define the vendor.
6. Save your changes.

---

## Changing the status of tools

Tool item statuses allow you to implement and enforce policies related to record creation and modification.

### About this task

---

Status changes are applied to the organization level. From the organization level, a status change is applied to the inventory level.

### Procedure

---

1. In the Tools application, select the tool for which you want to change the status.
2. In the toolbar, click the Change Status icon.  
The statuses that are available to you depend on the status of the tool.
3. Optional: If you want to apply the status change to lower-level records, select the Roll New Status to Organizations and Inventory check box.
4. Save your changes.

---

## Changing the organization details of tools

Tools are grouped into item sets that multiple organizations can use. However, the hourly tool rates, general ledger accounts, and tax codes that you apply to a tool are specific to a single organization.

### Procedure

---

1. In the Tools application, open a tool record.
2. Select the Tool/Organization Details action.
3. If you selected the Outside check box on the Tool tab to indicate that an external vendor supplied the tool, you can add the vendor company in the Outside Vendor field of the Tools/Organization Details window.  
When you associate a vendor to a tool at the organizational level, the control account number for the vendor defaults to the Control Account field. If the tool is not supplied by an outside vendor, the control account defaults from the tool control account for the organization.
4. In the Tool Rate field, specify the hourly rate that is charged to job plans, work order plans, and work order actuals when the tool is used.
5. Optional: Specify values for the general ledger account, and the tax code.
6. Optional: Specify whether the tool is tax-exempt.
7. Optional: Modify the percentage of tools that can be received over the quantity ordered. The percentage value was set when the tool record was added.
8. Click OK.
9. Save your changes.

---

## Copying tool records

If you need to create a tool that has similar attributes to another tool that exists, you can copy the existing tool record and reuse information as needed.

### Procedure

---

1. In the Tools application, open a tool record.
2. Select the Duplicate Tool action.
3. Enter information for the tool and a description of the tool.
4. Optional: Change other fields.
5. Save your changes.

---

## Creating units of measure

You can create a unit of measure to describe the quantity used to measure an item, tool, or a service. You use a unit of measure to measure the items and services that you order, issue, and transfer in the asset management system. Examples of units of measure include EACH, CASE, IN (inches), and ROLL.

### About this task

---

A unit of measure works with a conversion factor. The conversion factor represents the numeric value or ratio that the asset management system uses to relate one unit of measure to another. You can create units of measure and conversion factors in many applications:

- Assets
- Purchase Orders
- Purchase Requisitions
- Receiving
- Item Master
- Meters
- Service Items
- Tools
- Stocked Tools
- Inventory

You can delete a unit of measure only when it is not used in a conversion, on a specification template, or on a meter record.

### Procedure

---

1. Open an application.
2. Select the Unit of Measure and Conversion > Add/Modify Units of Measure action.
3. Insert a row.
4. In the Unit of Measure field, specify an identifier for the unit of measure.
5. Optional: Enter values in the following fields:
  - Abbreviation
  - Description

The abbreviation value along with an asset classification is used to create descriptions for assets, locations, and items.
6. Click OK.

---

## Creating commodity groups

You can create a commodity group to identify a grouping of items, tools, or services. A commodity group contains a grouping of individual commodity codes. Classifying items, tools, services with commodity groups and commodity codes provides a way for you to analyze spending by product type. You first define a commodity group and then add and associate individual commodity codes to the group.

### About this task

---

Once you have defined commodities you can associate them with company, contract, and item records. You can also associate commodities with individual purchase order or requisition lines for items, service items, or tools that do not have commodity codes assigned to them, including special order materials or services.

You can create commodity groups and codes in the following asset management system applications:

- Companies
- Item Master
- Purchase Orders
- Service Items
- Tools

### Procedure

---

1. Open an application.
2. Select the Add/Modify Commodity Codes action.
3. In the Commodity Groups table window, click New Row.
4. In the Commodity Group field, enter an identifier for the commodity group.
5. Specify whether you want a service type item or service level agreement to use this commodity group.

Option	Service
Use commodity group	Selected
Do not use commodity group	Cleared

6. In the Commodity Codes for Commodity Group table window, click New Row.
7. In the Commodity Code field, enter an identifier for the commodity.
8. Specify whether you want a service type item or service level agreement to use this commodity code.

Option	Service
--------	---------

Option	Service
Use commodity code	Selected
Do not use commodity code	Cleared

9. Click OK.

## Stocked Tools

You use the Stocked Tools application to manage existing tools in storerooms.

In the Stocked Tools application, you can perform the following tasks:

- View information about a stocked tool, including balance summaries, balance details, and issue history.
- Add new bin location and balance information for a stocked tool.
- Associate vendors with a tool and analyze vendor data.
- View a list of all assets associated with a rotating tool.
- Issue, return, or transfer a stocked tool.
- View the inventory transactions for a tool.
- Adjust the physical count and the current balance for a tool.
- Specify or modify the percentage of stocked tools that can be received over the quantity ordered. When a tool record is created in the Item Master application, the receipt tolerance percentage can be specified. The receipt tolerance percentage is applied to the organization level and to the vendor level for the tool.
- [Stocked tools overview](#)  
When managing existing tools in storerooms, you need to have an understanding of rotating tools and item sets.
- [Working with stocked tools](#)  
In the Stocked Tools application, you can manage the tools, change the status of tools, issue tools, transfer tools, view availability, and create units of measurement.

## Stocked tools overview

When managing existing tools in storerooms, you need to have an understanding of rotating tools and item sets.

- [Rotating tools](#)  
A rotating tool is an individual serialized asset, such as a nail gun or back hoe, that is defined by a common tool number. You mark a tool as rotating because it shares the same properties as an asset and you want to track each instance of that tool as an asset to monitor maintenance costs, downtime, etc.
- [Item sets](#)  
Item sets let multiple organizations within a company view and choose from a common set of items stocked in the storeroom. An organization can be associated with only one item set. However, multiple organizations can use the same item set.
- [Tax-exempt status](#)  
The tax-exempt option indicates whether an item, a tool, or a service is taxable. You might want to set the tax-exempt status, depending on where an item or a service is acquired, and how an item or a service is used.

## Rotating tools

A rotating tool is an individual serialized asset, such as a nail gun or back hoe, that is defined by a common tool number. You mark a tool as rotating because it shares the same properties as an asset and you want to track each instance of that tool as an asset to monitor maintenance costs, downtime, etc.

For example, you may have ten air compressors of the same model that share the same attributes, and they are all known by the common tool number Fermion-AC23. However, you want to be able to track each one as an individual asset, so you mark the tool as rotating.

After creating the tool and adding it to a storeroom, you can either use the Assets application to create the asset records for each individual tool you wish to track, or create a purchase order for the rotating tool and serialize it when you receive it. Once you have associated an asset to a rotating tool, the system can display and track balances for this tool. A rotating tool is tracked both by its tool number in Stocked Tool records and by its unique asset number in Assets records.

## Item sets

Item sets let multiple organizations within a company view and choose from a common set of items stocked in the storeroom. An organization can be associated with only one item set. However, multiple organizations can use the same item set.

You identify an item set with a unique name or number, and each item that belongs to the item set has a unique item number.

When you create an organization, you associate an item set to it. When you create an item, by default the item is placed into the item set associated with the organization for your default insert site.

## Tax-exempt status

The tax-exempt option indicates whether an item, a tool, or a service is taxable. You might want to set the tax-exempt status, depending on where an item or a service is acquired, and how an item or a service is used.

The situations under which items or services are tax-exempt vary depending upon your location, and upon current tax regulations. For example, the storeroom for an item might be in a location where sales taxes are not collected. In some cases, if an item becomes part of a product, that item can be tax-exempt. If the item is used as a stand-alone item, then the item is taxable. The buyer for your organization determines the tax-exempt status of items, of tools, and of services.

You can override the tax-exempt status for items, for tools, and for services in the following applications:

- Purchase Requisitions
- Purchase Orders
- Invoices

When you specify the tax-exempt status, you can apply the status at the organization level and at the vendor level.

---

## Working with stocked tools

In the Stocked Tools application, you can manage the tools, change the status of tools, issue tools, transfer tools, view availability, and create units of measurement.

- **[Managing stocked tools](#)**  
You can add bins and locations to stocked tools, adjust balances, adjust physical counts, associate vendors, manage vendor lists, and create spare parts lists.
- **[Changing the status of stocked tools](#)**  
Tool statuses allow you to implement and enforce policies related to record creation and modification. You can change the status of a tool record in the Stocked Tools application.
- **[Issuing stocked tools](#)**  
You can specify tools on job plans and work orders to indicate which tools are needed to perform a task. In the Stocked Tools application, you can issue tools to those work orders to indicate that the tools are dispatched for use with the job.
- **[Transferring stocked tools](#)**  
You can transfer stocked tools from one storeroom to another, including cross-site transfers within an organization if you have access to those storerooms. When you transfer a tool, the From Storeroom field defaults to the current storeroom for the stocked tool you are viewing.
- **[Viewing availability of stocked tools](#)**  
You use the Stocked Tools application to view how many stocked tools are available by location or lot, exist on purchasing requests and order, and are reserved. You can also view the availability of any alternate tools.
- **[Creating units of measure](#)**  
You can create a unit of measure to describe the quantity used to measure an item, tool, or a service. You use a unit of measure to measure the items and services that you order, issue, and transfer in the asset management system. Examples of units of measure include EACH, CASE, IN (inches), and ROLL.
- **[Creating conversion factors](#)**  
You can create a conversion factor to define the numeric value or ratio that the asset management system uses to relate one unit of measure to another. The conversion factor is an alternate value that is used to represent a unit of measure. You can use this alternate value to define an item order or transfer quantity and storeroom balance.

---

## Managing stocked tools

You can add bins and locations to stocked tools, adjust balances, adjust physical counts, associate vendors, manage vendor lists, and create spare parts lists.

- **[Adding bin locations and balances to stocked tools](#)**  
You use the Stocked Tools application to add bin locations and a current balance and physical count for new bins.
- **[Setting year to date inventory quantities to zero](#)**  
At the end of each year, you must move the usage history for the selected records from the current year history to the previous year history. By default, inventory records are saved for the current year and the previous four years.
- **[Reconciling balances](#)**  
You can adjust current balances based on a physical count. This transaction is for the selected item in a selected storeroom only. By default, the storeroom that is identified in the Inventory tab.
- **[Adjusting the physical counts of stocked tools](#)**  
You can adjust the physical count for a tool that is stocked in a storeroom. The physical count is a number that you can adjust at predefined intervals, such as monthly, quarterly, or annually.
- **[Adjusting current balances of stocked tools](#)**  
You use the Stocked Tools application to adjust the current balance of a stocked tool. The current balance is a running total of how many instances of the tool are in a storeroom. For each bin in the storeroom, you can enter a new current balance, and specify the control and shrinkage account numbers associated with the adjustment.
- **[Associating vendors with stocked tools](#)**  
You can associate vendors with a stocked tool and manage a list of vendors that supply a tool. The list can include vendors from which you have already ordered and vendors that you have not used. You can use the historical vendor data to compare vendor prices and delivery information.
- **[Creating spare part lists for stocked tools](#)**  
You use the Stocked Tools application to create a list of parent assets to indicate where a tool is used as a spare part (or child tool).

---

## Adding bin locations and balances to stocked tools

You use the Stocked Tools application to add bin locations and a current balance and physical count for new bins.

## About this task

---

If you want to adjust an existing tool's current balance or physical count, use the actions for that functionality.

## Procedure

---

1. In the Stocked Tool application, display a tool record.
2. In the Balances table window on the Stocked Tools tab, click New Row to add a new bin location for this tool.
3. Optional: Enter values for the bin, lot, and current balance.
4. Save your changes.

---

## Setting year to date inventory quantities to zero

At the end of each year, you must move the usage history for the selected records from the current year history to the previous year history. By default, inventory records are saved for the current year and the previous four years.

## Procedure

---

1. In the Inventory application, select the records whose usage history you want to change.
2. Select the Inventory Adjustments > Zero Year to Date Quantities action.
3. Click OK.

---

## Reconciling balances

You can adjust current balances based on a physical count. This transaction is for the selected item in a selected storeroom only. By default, the storeroom that is identified in the Inventory tab.

## About this task

---

The system includes issues, returns, transfers, and receipts after the physical count to calculate the new balance.

## Procedure

---

1. From the List tab of the Inventory application, display the item you want.
2. Click the Inventory tab.
3. Select the Reconcile Balances action.
4. Click Select Value to choose the control account and the shrinkage general ledger account.
5. Click OK. A reconcile adjustment transaction for the adjustment is generated. The Quantity field in the transaction record reflects the change to the current balance after the adjustment is made.

---

## Adjusting the physical counts of stocked tools

You can adjust the physical count for a tool that is stocked in a storeroom. The physical count is a number that you can adjust at predefined intervals, such as monthly, quarterly, or annually.

## About this task

---

You cannot adjust the physical count of a rotating tool. After you perform an inventory count, you can adjust the physical count for any storeroom and enter the count date. You can then reconcile the balance to the current count.

## Procedure

---

1. In the Stocked Tools application, open a tool record.
2. Select the Adjustments > Physical Count action.
3. To specify the date on which the physical count was taken, do one of the following in the Physical Count Adjustment window:
  - In the Physical Count Date field, click the Set Date and Time icon and adjust the date for all rows.
  - Edit the Count Date field to adjust the date for individual rows.
4. Click Refresh to update the count dates.
5. For each bin that you want to adjust, enter a new physical count value in the New Count field.
6. Click OK.

---

## Adjusting current balances of stocked tools

You use the Stocked Tools application to adjust the current balance of a stocked tool. The current balance is a running total of how many instances of the tool are in a storeroom. For each bin in the storeroom, you can enter a new current balance, and specify the control and shrinkage account numbers associated with the adjustment.

### About this task

---

You cannot adjust the current balance of a rotating tool.

### Procedure

---

1. In the Stocked Tools application, open a tool record.
2. Select the Adjustments > Current Balance action to open the Current Balance Adjustment window.
3. In the New Balance field for each bin that you want to adjust, enter a new balance value.
4. Click OK.

---

## Associating vendors with stocked tools

You can associate vendors with a stocked tool and manage a list of vendors that supply a tool. The list can include vendors from which you have already ordered and vendors that you have not used. You can use the historical vendor data to compare vendor prices and delivery information.

### Before you begin

---

Before you can associate vendors to a stocked tool, you must create the vendors in the Companies application.

### Procedure

---

1. In the Stocked Tools application, select the tool to which you want to associate vendors.
2. On the Vendors tab, click New Row.
3. Specify a value for the vendor.  
The values for the vendor, the vendor description, the currency, and the tax code are provided.
4. In the Promised Lead Time (Days) field, specify the number of days for the vendor to supply the tool.
5. Optional: In the Receipt Tolerance % field, specify or modify the percentage of stocked tools that can be received over the quantity ordered.
6. Optional: If the stocked tool is not taxable, select the Tax Exempt check box. The buyer for your organization determines the tax-exempt status of tools.
7. Optional: Complete the remaining fields to further define the vendor.
8. Save your changes.

---

## Creating spare part lists for stocked tools

You use the Stocked Tools application to create a list of parent assets to indicate where a tool is used as a spare part (or child tool).

### About this task

---

If you use the Spare Parts tab in the Assets application to associate tools to the asset, you can view the tools on the Where Used tab in the Stocked Tools application.

### Procedure

---

1. In the Stocked Tools application, display a tool record.
2. On the Where Used tab, click New Row to add a parent asset.
3. In the Quantity field, enter how many instances of the stocked tool are used on the parent asset.
4. Optional: Enter remarks about the location and additional parent assets.
5. Save your changes.

---

## Changing the status of stocked tools

Tool statuses allow you to implement and enforce policies related to record creation and modification. You can change the status of a tool record in the Stocked Tools application.

### Procedure

---

1. In the Stocked Tools application, select the tool for which you want to change the status.
2. In the toolbar, click the Change Status icon.  
The statuses that are available depend on the status of the tool.
3. Click OK to change the status.

---

## Issuing stocked tools

You can specify tools on job plans and work orders to indicate which tools are needed to perform a task. In the Stocked Tools application, you can issue tools to those work orders to indicate that the tools are dispatched for use with the job.

---

### Before you begin

When you issue a tool from the Stocked Tools application, you must specify to whom you are issuing the tool.

---

### Procedure

1. In the Stocked Tools application, open a tool record.
2. Select the Issue Current Tool action.
3. Optional: In the Issue Current Tool window, change the value in the Bin field to issue the tool from a different bin.
4. In the Quantity field, specify the number of tools that you want to issue.
5. Optional: In the Rotating Asset field, specify the value for the rotating tool.
6. In the Transaction Type field, specify the value for type:

Option	Description
<b>ISSUE</b>	To issue a tool to a person, as well as to an asset, location, or work order
<b>RETURN</b>	To return a tool to a storeroom

7. In the Issue To field, specify the recipient of the tool (person ID).
8. Optional: Complete the remaining fields.
9. Click OK.

---

### Results

The tool is issued to the intended recipient and the stocked tool balance is adjusted.

---

### Example

You can also issue a stocked tool from a storeroom directly to someone who needs the tool to perform work. For example, you might need to have a hammer available for employees, yet you do not want to associate this tool with a work order because hammers are not specific to any work order. You also can use the Issue function to return tools to a storeroom.

---

## Transferring stocked tools

You can transfer stocked tools from one storeroom to another, including cross-site transfers within an organization if you have access to those storerooms. When you transfer a tool, the From Storeroom field defaults to the current storeroom for the stocked tool you are viewing.

---

### Before you begin

You transfer items between storeroom locations or bins from the same site or another site in the same organization.

---

### Procedure

1. In the Stocked Tools application, open a tool record.
2. Select the Transfer Current Tool action.
3. In the Transfer Current Tool window, specify the number of tools that you want to transfer.
4. Select a storeroom to which to transfer the tool.
5. Optional: Specify the bin numbers.
6. Select a site to which to transfer the tool.
7. Optional: If the Conversion Factor field is blank, enter the conversion ratio for the transaction.  
For example, if the storeroom from which you are transferring is measured in boxes, and your receiving storeroom is each, then your conversion ratio is between box and each.
8. Optional: Specify general ledger debit and credit values.
9. Click OK.

---

### Results

The tools are transferred to the storeroom that you specified and the supplying and receiving storerooms balances are adjusted.

---

## Viewing availability of stocked tools

You use the Stocked Tools application to view how many stocked tools are available by location or lot, exist on purchasing requests and order, and are reserved. You can also view the availability of any alternate tools.

### Procedure

---

1. In the Stocked Tools application, open the tool record for which you want to view availability.
2. Select the View Tool Availability action.
3. In the View Tool Availability window, complete the following steps to view information:
  - Click the All Locations tab to view how many tools are available in any storeroom.
  - Click the All Lots tab to view how many tools are available in each lot.
  - Click the Purchasing tab to view the quantity of tools on order from all outstanding approved and unapproved purchase requisitions referenced in the purchase orders, as well as approved and unapproved purchase orders.
  - Click the Alternates tab to view how many alternate tools are available for this tool.
  - Click the Reservations tab to view how many tools are currently reserved.

---

## Creating units of measure

You can create a unit of measure to describe the quantity used to measure an item, tool, or a service. You use a unit of measure to measure the items and services that you order, issue, and transfer in the asset management system. Examples of units of measure include EACH, CASE, IN (inches), and ROLL.

### About this task

---

A unit of measure works with a conversion factor. The conversion factor represents the numeric value or ratio that the asset management system uses to relate one unit of measure to another. You can create units of measure and conversion factors in many applications:

- Assets
- Purchase Orders
- Purchase Requisitions
- Receiving
- Item Master
- Meters
- Service Items
- Tools
- Stocked Tools
- Inventory

You can delete a unit of measure only when it is not used in a conversion, on a specification template, or on a meter record.

### Procedure

---

1. Open an application.
2. Select the Unit of Measure and Conversion > Add/Modify Units of Measure action.
3. Insert a row.
4. In the Unit of Measure field, specify an identifier for the unit of measure.
5. Optional: Enter values in the following fields:
  - Abbreviation
  - Description

The abbreviation value along with an asset classification is used to create descriptions for assets, locations, and items.
6. Click OK.

---

## Creating conversion factors

You can create a conversion factor to define the numeric value or ratio that the asset management system uses to relate one unit of measure to another. The conversion factor is an alternate value that is used to represent a unit of measure. You can use this alternate value to define an item order or transfer quantity and storeroom balance.

### Before you begin

---

You must define the units of measure before you can create conversion ratios.

### About this task

---

You can create units of measure and conversion factors in the following applications:

- Purchase Orders
- Purchase Requisitions
- Receiving
- Item Master
- Service Items
- Tools
- Stocked Tools
- Inventory

## Procedure

1. Open an application.
2. Select the Unit of Measure and Conversion > Add/Modify Conversions action.
3. Click New Row.
4. Enter values in the following fields:

Option	Description
<b>From Unit of Measure</b>	The original unit of measure value that you are converting from in the conversion factor calculation.
<b>To Unit of Measure</b>	The unit of measure value that you are changing or replacing in the conversion factor calculation.
<b>Conversion Factor</b>	The ratio that is applied to relate one unit of measure to another.

5. Optional: In the Item Number field, enter the item number that is associated to the conversion.
6. Click OK.

## Inventory

You can use the Inventory application to store information about all aspects of inventory materials. You can monitor the storeroom balance of inventory items and tools. You can track the condition of items and the cost of inventory stock, and you can reorder items when stock must be replenished.

You can monitor the use of special order items and stocked items. Vendor information can be stored and items can be reordered promptly when the storeroom balance indicates that the items must be replenished.

You can check the balances of individual items and tools at the bin and lot level for each storeroom. If an item is stored in more than one location, you can view balances for all storeroom locations on one screen.

If this item is already in a pick list, you can view the picked quantity in the Other Balance Summary Information section. Pick lists are created and managed in the Reservations page of the Manage Inventory Work Center.

Use the ABC Analysis area on the Inventory tab to determine the requirement for an item. You can consider the usefulness of the item and determine the financial benefit that would result from investing in an item.

Use the Inventory application to perform the following tasks:

- Search the database for inventory items and tools.
- Specify the balances of items and item costs.
- Specify the bins and lots where items are stored, and view the storeroom locations.
- Issue, transfer, and return inventory items by site and storeroom location.
- Specify reorder details, such as the reorder point, the lead time, and the order unit of an item. You can also specify information about the vendors that supply an item and the multiple manufacturers or models that are associated with each vendor.
- Identify and track rotating assets that are associated with a rotating item.
- List all assets for which an item is listed as a subassembly or a spare part.
- Specify the percentage of items that can be received over the quantity ordered.
- [ABC analysis](#)  
ABC analysis is a technique that identifies the items that represent the greatest investment for your company in terms of monetary value and turnover rate.
- [Rotating assets](#)  
A rotating asset is an interchangeable asset that you can move in and out of service as needed. The term applies to assets that can be repaired or refurbished rather than replaced.
- [Inventory costs](#)  
You control the cost of inventory items and tools by using a range of costing methods. You can set a standard cost, or you can issue inventory items at an average cost so that price variations are reflected. Last-in-first-out (LIFO) and first-in-first-out (FIFO) costing captures and applies the cost of items on receipt.
- [Issues, transfers, and returns in inventory](#)  
Organizations consume the items and tools in inventory storerooms in different ways. Issues, transfers, and returns are methods for monitoring and controlling the movement and consumption of inventory items and tools.
- [Consignment items in inventory](#)  
Consignment items are inventory items that are kept in a storeroom on-site and owned by an external vendor. The vendor retains financial ownership of the consignment items until they are used by the organization that is storing them.
- [Inventory replenishment](#)  
With the daily use of inventory items and tools, organizations must replenish inventory stock to stay functional. You replace used inventory stock by reserving and reordering items and tools that you need.

## ABC analysis

ABC analysis is a technique that identifies the items that represent the greatest investment for your company in terms of monetary value and turnover rate.

The ABC analysis feature ensures that crucial inventory does not fall below minimum levels, and helps to ensure that the current balance figures for items remain reconciled with the actual count. The ABC type for an item is determined by running an ABC analysis report that multiplies the year-to-date issued quantity by the last cost of the item. Each item is sorted in descending order of the dollar value that is reached by this calculation. The ABC type is set to A, B, or C based on a percentage that you set as a default in the Organizations application.

The ABC analysis report changes the cycle count frequency for an item, based on the ABC type and on the count frequency. If the ABC type is set to N, the cycle count frequency does not change. In the Organizations application, set the count frequency to the number of days for each ABC type.

---

## Example

The ABC type is set to A, B, or C based on a percentage that you set as a default. For example, you can set the following percentages:

- Type A breakpoint 30%
- Type B breakpoint 30%
- Type C breakpoint 40%

When you apply these values, the top 30% of items by cost are type A, the next 30% of items are type B, and the last 40% are type C.

---

## Rotating assets

A rotating asset is an interchangeable asset that you can move in and out of service as needed. The term applies to assets that can be repaired or refurbished rather than replaced.

Rotating assets can be items such as pumps and motors, fire extinguishers, motors and transmissions, and notebook computers and network printers.

Before a rotating asset can be created, you must define the item in the Item Master application. You create rotating assets in the Assets application or by receiving a purchase order that contains a rotating asset.

---

## Item number

A rotating asset has an item number, which can be used to track the rotating asset as it moves from one storeroom to another or to a repair facility. By using an asset number and an item number, you can track identical assets individually or with their shared item number as a group.

---

## Example

A company might have 50 identical fire extinguishers (the same model from the same manufacturer) that have the same item number. Each fire extinguisher has a unique asset number. You can use the asset number to track information such as when the asset was purchased, when it was inspected, and when it must be replaced.

---

## Inventory costs

You control the cost of inventory items and tools by using a range of costing methods. You can set a standard cost, or you can issue inventory items at an average cost so that price variations are reflected. Last-in-first-out (LIFO) and first-in-first-out (FIFO) costing captures and applies the cost of items on receipt.

LIFO and FIFO costing is more precise than other costing methods. You can monitor the value of your inventory stock based on actual receipt costs. The costing method that you apply is used whenever an inventory transaction occurs.

LIFO costing

Last-in-first-out costing uses the receipt cost of items that are the newest in stock.

FIFO costing

First-in-first-out costing uses the receipt cost of items that are the oldest in stock.

---

## Example

Prices generally rise over time because of inflation. As a result, the older inventory items in stock can decrease in value. Under the FIFO costing method, as the older and cheaper goods are sold, the newer and more expensive goods remain as assets to the company.

A company that uses the LIFO costing method sells the most expensive (newest) inventory stock first. As profits are decreased, the company benefits from a lower rate of tax.

---

## Issues, transfers, and returns in inventory

Organizations consume the items and tools in inventory storerooms in different ways. Issues, transfers, and returns are methods for monitoring and controlling the movement and consumption of inventory items and tools.

You create inventory usage records to track the issue, transfer, and return of inventory items within and across organizations. You can also make quick issues and transfers of inventory as you work.

You use inventory usage records for the following tasks:

#### Issuing items

You can issue inventory items or tools by assigning them to a work order, to an asset, to an operating location, or to a general ledger (GL) account. You can also issue items to satisfy reservations, such as for use on a work order. Items can be issued to a charging entity that belongs to the same site or across sites within an organization.

#### Transferring items

You can transfer inventory items or tools from one storeroom to another storeroom to satisfy the requirement for the items in another location. You can move inventory stock between storerooms located in two different sites of the same organization, or between sites that belong to separate organizations.

#### Returning items

You can return inventory items to the original storeroom. For example, you can return parts that were previously issued from a storeroom, but were not used.

---

## Consignment items in inventory

Consignment items are inventory items that are kept in a storeroom on-site and owned by an external vendor. The vendor retains financial ownership of the consignment items until they are used by the organization that is storing them.

Consignment items are not included in the inventory valuation of an organization. Consignment items have a financial impact only when they are consumed, at which point, payment must be made to the vendor.

Rotating items and condition-enabled items cannot be flagged as consignment items.

---

## Example

A factory uses plant machinery that is critical for production. The factory stocks certain service parts as consignment items, either because their budget is restrictive or demand for such items is irregular.

The vendor who supplies the parts benefits from this arrangement by providing a ready supply of parts and thus saving on expedited freight costs. The vendor can also be certain that the customer does not procure the replacement parts from a competitor.

---

## Inventory replenishment

With the daily use of inventory items and tools, organizations must replenish inventory stock to stay functional. You replace used inventory stock by reserving and reordering items and tools that you need.

- [Inventory item reservations](#)  
You can create reservations for inventory items and tools to ensure that they are replenished in the inventory stock on time. You can create hard reservations or soft reservations, which are based on the importance of the inventory requirement.
- [Reordering inventory items](#)  
You can reorder inventory items or tools when the storeroom balance indicates that the items must be replenished. You can also reorder items that are listed on approved work orders, which can be issued without being received into inventory.
- [Reorder locks](#)  
When you reorder items in the Inventory application, a lock is placed on the storeroom being restocked. This action prevents other users from reordering items for the same storeroom at the same time.

---

## Inventory item reservations

You can create reservations for inventory items and tools to ensure that they are replenished in the inventory stock on time. You can create hard reservations or soft reservations, which are based on the importance of the inventory requirement.

A *hard reservation* is a request for materials that is defined by the need for an item within a specific timeframe. You can specify that the reorder process includes only hard reservations. You can also specify that inventory items can be issued from a storeroom only when they are associated with a hard reservation. Hard reservations of inventory items are prioritized so that they cannot be superseded by other requests.

A *soft reservation* is a request for materials that is not subject to a timeframe. You can create a soft reservation to ensure that the item or tool is available for issue at any time that it is needed.

Hard and soft reservation types can be set automatically. You can apply automatic processing to determine hard or soft reservations, which are based on the date that the materials are required. You select automatic processing for reservation types in the Purchase Orders, Purchase Requisitions, and Desktop Requisitions applications. In the Reservation type field of a work order, reservations are set in the Planned Material line. In an internal purchase order, when an attendant storeroom is selected on a purchase order line, you set reservations in the Reservation type hidden field.

The *backorder* reservation type can also be applied using automatic processing. Backorder indicates that an inventory item or tool can have only hard reservations, and that the reservation quantity must be satisfied by the available balance on the inventory record. An organization must disallow negative availability to use the Backorder reservation type.

---

## Example

Organizations planning large-scale projects require specific materials during a set timeframe. You can specify the materials that must be replenished in the inventory stock at regular intervals. You can specify that other materials must be available for use only when needed.

---

## Reordering inventory items

You can reorder inventory items or tools when the storeroom balance indicates that the items must be replenished. You can also reorder items that are listed on approved work orders, which can be issued without being received into inventory.

---

### Procedure

1. From the List tab of the Inventory application, select the item or tool that you want to reorder.
2. On the Inventory tab, select the [Reorder > Reorder Items](#) action and specify the reorder options that you want to apply to the record.
3. Click the Reorder Details tab and specify the reorder and vendor data for the item. If you are applying a reorder point to the item record, the reorder point value is calculated based on the data you enter in the Safety Stock, Lead Time, and Economic Order Quantity fields.

---

## Reorder locks

When you reorder items in the Inventory application, a lock is placed on the storeroom being restocked. This action prevents other users from reordering items for the same storeroom at the same time.

When you reorder items in preview mode, you can inadvertently create a reorder lock even though you are no longer using the process. While you are in preview mode, reorder locks can occur under the following circumstances:

- You click a browser navigation button.
- The server times out while the reorder process is running. If the server times out, restart the server.
- The session times out. If the session times out, the lock clears after 30 minutes. Your system administrator can change this setting to a longer duration or to a shorter duration. The length of time for the lock can be specified in the `mxe.reorder.previewtimeout` property.

Reorder locks must be removed after the reorder process is complete. You remove reorder locks by selecting [Reorder > Clear Reorder Locks](#).

---

## Count Books

You use the Count Books application to select inventory for periodic counting and to record the results of physical counts. You can then reconcile discrepancies between expected and actual quantities.

- [Count Books overview](#)  
When you create a count book, you specify the items from the storeroom that you want to include in the count book. You record physical counts for items, and reconcile individual items or groups of items.
- [Managing inventory count](#)  
After you create a count book and record physical counts, you reconcile the physical count values of items parts with their current balance values.

---

## Count Books overview

When you create a count book, you specify the items from the storeroom that you want to include in the count book. You record physical counts for items, and reconcile individual items or groups of items.

- [Inventory count books](#)  
A *count book* is a list of items in a storeroom for which you want to periodically record inventory physical counts. You can check the accuracy of the system-calculated balances relative to the physical counts and reconcile the differences.
- [Inventory count groups](#)  
Inventory count groups (ICGs) can be used to subdivide items in a storeroom into smaller groups so that count books can be managed more efficiently.
- [Inventory count tolerances](#)  
You establish plus and minus count tolerances, expressed as percentages, for each item in a storeroom. The tolerances are used to determine the accuracy of the physical count compared to the system-calculated current balance.
- [Item balance reconciliation](#)  
When you reconcile item balances, the physical count is compared to the adjusted current balance for each item. You can reconcile item balances for counts that match the current balance from the Count Books application.

---

## Inventory count books

A *count book* is a list of items in a storeroom for which you want to periodically record inventory physical counts. You can check the accuracy of the system-calculated balances relative to the physical counts and reconcile the differences.

You can do the following tasks by using count books:

- Select rotating items and non-rotating items from a storeroom for periodic physical counting.
- Record, view, and analyze the physical counts.
- Reconcile any discrepancies between expected and actual quantities.

You follow a standard sequence of steps when you create and use a count book.

1. Create the count book and identify the storeroom where the count occurs.
2. Specify a selection criterion for storeroom items.
3. For any selection criterion that requires it, select the item to be counted. For some criteria, such as All, you do not have to select items.
4. Approve the count book.
5. Conduct the physical count, record the results, and save the count book.
6. Reconcile item balances.
7. Complete the count book.

When you change the count book status to complete (COMP), the current balance values are updated in the Inventory application. Accounting entries are generated for the inventory adjustments.

## Inventory count groups

Inventory count groups (ICGs) can be used to subdivide items in a storeroom into smaller groups so that count books can be managed more efficiently.

To use inventory count groups, you must create ICG identifiers for the PLUSTCB\_ICG domain in the Domains application. The ICG identifiers are then available for associating with items in the Inventory application. They are also available for assigning to count books in the Count Books application.

You manually assign inventory count groups to items in the Inventory application. Use the Count Group value to assign a group identifier to multiple items. Using an inventory count group name that is common to a subset of storeroom items, you can select that group of items for a count book.

By subdividing the items in a storeroom into multiple count groups, you can create a series of count books with different inventory count groups for each. With this approach, you can count items in the storeroom periodically: daily, weekly, or monthly, for example.

You can also use inventory count groups to classify items by other criteria, such as Hazardous, High Value, or Critical Spare. You can define the count groups that match your business requirements.

## Example for counting items every three months

Suppose that you want to count all items in a storeroom one time every three months (every 60 work days). And you want to count an equal number of items every day. Divide the items in that storeroom into 60 groups. If you have 1200 items in a storeroom, you can assign inventory count groups as follows:

items	Inventory count group
The first 20 items (1200 divided by 60 equals 20)	C1
The next 20 items, and the next 20	C2, C3*, ...
The last 20 items	C60

You can now specify C1 as an inventory count group in the Select items table in the Count Books application. The first 20 items in the storeroom are selected for counting.

## Inventory count tolerances

You establish plus and minus count tolerances, expressed as percentages, for each item in a storeroom. The tolerances are used to determine the accuracy of the physical count compared to the system-calculated current balance.

For example, a plus tolerance of five percent means that a physical count of 105 is considered a match with a system-calculated current balance of 100. The difference of the physical count from the system-calculated current balance is five percent or less. A physical count of 106 is not a match. You can reconcile physical counts from the Count Books application for counts that are a match, within tolerances, of the current balance values. Physical counts that are not a match must be manually reconciled in the Inventory application.

You set default tolerances on the Count Books Options window in the Organizations application. The tolerance values that are established in the Organizations application are used as the default tolerance values for all items. However, you can change the default tolerance values for individual items in the Inventory application.

## Item balance reconciliation

When you reconcile item balances, the physical count is compared to the adjusted current balance for each item. You can reconcile item balances for counts that match the current balance from the Count Books application.

To reconcile the balance of items from the Count Books application, the physical count must be a match with the system-calculated current balance. That is, it must be within tolerances as defined in the Organizations application or in the Inventory application. For matches, the adjusted current balance is reset to the physical count value when you select Reconcile. After you reconcile item balances and change the status of the count book to COMP (complete), the inventory balances in the database are updated.

Items with a physical count that is not a match must be reconciled manually in the Inventory application.

For non-rotating items, standard inventory processing is used to adjust the current balance and to account for the change in inventory value. You can also count rotating items. For rotating items, you must reconcile any counting discrepancies for each individual serial number by using the Move Asset action in the Assets application.

After you reconcile item balances, you can undo the reconciliation for individual count book lines or all count book lines. For some items, you might want to investigate count discrepancies, even if within tolerances, and manually adjust the current balance in the Count Book application. When you undo the reconciliation of item balances, the updated GL Debit Account and GL Credit Account values remain in place. You can undo the reconciliation of item balances until you change the count book status to complete (COMP).

---

## Managing inventory count

After you create a count book and record physical counts, you reconcile the physical count values of items parts with their current balance values.

- **Creating count books**  
You create count books to record physical counts of items in inventory. You specify a selection criterion and based on the criterion, either you or the system selects items for that count book.
- **Reconciling item balances**  
You can reconcile item balances for items whose physical count is recorded in a count book. When you reconcile item balances, the adjusted current balance values for storeroom items are set to the physical count values.

---

## Creating count books

You create count books to record physical counts of items in inventory. You specify a selection criterion and based on the criterion, either you or the system selects items for that count book.

---

### About this task

You can add new items to a count book when you choose the selection type as ITEMS and when the count book status is either waiting for approval (WAPPR) or approved (APPR).

You can delete any items that are already selected in a count book, when a count book status is WAPPR. You cannot delete any items that are already selected when a count book status is APPR.

You can change the selection type to one of the following sample selection types, when a count book status is WAPPR. Selection type changes are not possible when a count book status is APPR.

- ALL
- ITEMS
- ROTATING
- ICG
- TOOLS

---

## Procedure

1. In the Count Books application, click New Count Book.
2. Specify the storeroom that you want to count.
3. Specify GL accounts in the GL Credit Account and GL Debit Account fields.
4. Specify the selection criterion.

The selection criterion determines the set of items that is added to the count book. Selection criteria are defined in the Inventory Counting Options window in the Organizations application.

- Specify **ALL** to add all of the countable items in the storeroom to the Count Book Lines tab. If you select ALL, you do not specify items in the Select Items table.
  - Specify **CNTFRQ** (count frequency) to select all countable items in the storeroom whose physical count is due on or before the date in the Count Date field. Selection is based on the last count date and the count frequency value of each item. You specify the count frequency for items in the Inventory application.
  - Specify **ICG** (inventory count group) to select members of the count group. The ICG must be the ICG for at least one countable item in the storeroom. You can specify multiple ICGs. You assign an inventory count group to an item in the Inventory application.
  - Specify **ITEM** to select one or more items. The item numbers that you specify must exist as countable items in the storeroom.
  - Specify **ROTATING** to select rotating items (serialized items) only, that is, items that have an asset number and an item number.
  - Specify **TOOLS** to select only items that are tools, that is, items whose commodity group is Tools.
5. If you specify **CNTFRQ**, **ITEM**, or **ICG** as the selection criterion, specify at least one value in the Select items table.  
The value or values that you specify direct the selection of items or groups of items for the count book. To select values, specify the essential data for the specified selection criterion.
    - If you specified **CNTFRQ**, specify a date in the Count Date field. Items that have a count that is scheduled before that date, based on the value in the Count Frequency field in the Inventory application, are selected.
    - If you specified **ITEM**, specify an item in the Selection Items field. Click New Row to add items..
    - If you specified **ICG**, specify an inventory count group in the Selection ICG field. Click New Row to add ICGs.
  6. Save the count book.

---

## Results

The selected items are listed on the Count Book Lines tab.

---

## What to do next

Approve the count book and record the physical count for all items on the Count Book Lines tab.

---

## Reconciling item balances

You can reconcile item balances for items whose physical count is recorded in a count book. When you reconcile item balances, the adjusted current balance values for storeroom items are set to the physical count values.

---

### Procedure

1. In the Count Books application, select an in-progress count book that has physical count data.
2. From the menu, select the Reconcile action.  
The item balances are reconciled for counts that match. The Reconcile checkbox is selected for count book lines that are reconciled.
3. Optional: "Unreconcile" any count book line for which you do not want the item current balance to be set to the physical count. Clear the Reconcile checkbox for the count book line.  
When you unreconciled item balances, the updated GL Debit Account and GL Credit Account values remain in place. You can click the Unreconcile action to undo reconciliation of all reconciled rows.
4. Save the count book.

---

## What to do next

To make the reconciled balances permanent in the database, change the status of the count book to complete (COMP) and save the count book.

---

## Inventory Usage

With the daily use of inventory items and tools, inventory materials must be moved between storerooms to supply the different areas of a site. You use the Inventory Usage application to create inventory usage records that track the issue, transfer, and return of inventory items within and across organizations.

You can monitor the balance of inventory items that are in stock, and you can issue items or tools directly to charge entities such as work orders, locations, or assets. You can also issue items or tools against a general ledger account on-site, across sites in an organization, or across organizations.

- [Inventory usage records](#)  
You use inventory usage records to track the issue, transfer, and return of inventory items within and across organizations.
- [Issues, transfers, and returns in inventory](#)  
Organizations consume the items and tools in inventory storerooms in different ways. Issues, transfers, and returns are methods for monitoring and controlling the movement and consumption of inventory items and tools.

---

## Inventory usage records

You use inventory usage records to track the issue, transfer, and return of inventory items within and across organizations.

Inventory usage records can contain multiple usage lines, which track the movement of inventory items into and out of storerooms and bins. Inventory usage lines can be added or removed from inventory usage records so that records can be updated quickly and easily.

Items that are associated with an inventory usage line can be picked by using the Pick and Stage feature in the Manage Inventory Work Center. If items are associated with a pick list, you can view information about the pick list and its status in the line detail.

Inventory usage records are categorized into types that summarize the intended purpose of the inventory usage record.

- [Inventory usage types](#)  
Inventory usage types categorize the intended purpose of an inventory usage record. Inventory usage types indicate that a record comprises only issue or return items, only transfer items, or a mixture of all item types.
- [Inventory usage record statuses](#)  
Changing the status of inventory usage records initiates transactions that adjust inventory information. Inventory transactions can adjust storeroom balances or the financial data that is associated with the inventory record.
- [Split Usage Quantity feature](#)  
If you require a quantity of inventory items that exceeds the amount that is stored in a single storage bin, you can split the inventory usage line across multiple bins to meet the required quantity.

---

## Inventory usage types

Inventory usage types categorize the intended purpose of an inventory usage record. Inventory usage types indicate that a record comprises only issue or return items, only transfer items, or a mixture of all item types.

When you create a record in the Inventory Usage application, the default usage type is Mixed. You can change the usage type before you start filling out the record by adding inventory usage lines.

Inventory usage records can have one of the following usage types:

**Issue**

All usage lines in the record contain items for issue or return only.

**Transfer**

All usage lines in the record contain items for transfer only.

**Mixed**

The record contains a combination of issue lines, transfer lines, and return lines.

---

## Inventory usage record statuses

Changing the status of inventory usage records initiates transactions that adjust inventory information. Inventory transactions can adjust storeroom balances or the financial data that is associated with the inventory record.

The following statuses apply to inventory usage records:

Status	Description
Entered	The default status for an inventory usage record when it is created. When a record is in Entered status, some default fields cannot be modified.
Shipped	Indicates that the item has been removed from the inventory storeroom and is in transit to its final destination.
Staged	Indicates that inventory items are ready and waiting to be issued or transferred. When you set the usage record status to Staged, you must choose the stage bin that you want to use. You cannot change the status of the record to Staged if the record contains one or more usage lines of the type Return. You cannot change the status of the record to Staged if the status is Shipped, Cancelled, or Complete.
Complete	Indicates that the issue, transfer, or return of items is complete. When you change the status to Complete, the appropriate transactions are generated to adjust the balance of inventory storerooms.
Cancelled	Canceled records cannot be edited, and any staged balances are reversed. This status is available if the current inventory usage status is Entered or Staged.

---

## Split Usage Quantity feature

If you require a quantity of inventory items that exceeds the amount that is stored in a single storage bin, you can split the inventory usage line across multiple bins to meet the required quantity.

When the default bin does not contain a sufficient quantity of items to satisfy the quantity on the inventory usage line, you can create a single inventory usage line to request items from multiple storage bins. When the inventory usage record is complete, multiple transactions are initiated to source the items from the locations you specified. The split usage quantity feature initiates different behavior for rotating items and for non-rotating items.

**Non-rotating items**

When the quantity in a storage bin does not meet the required quantity on the inventory usage line, the split usage quantity feature is activated. The feature is triggered when the status of the record changes to Staged, Shipped, or Complete. When you are prompted, you must specify the additional bins to source the items from in the Split Usage Quantity window. You can either click New Row or Auto-Split. You can also modify the original usage line quantity, or cancel this process.

**Rotating items**

All rotating item usage lines that have a quantity of more than one must be split, as each usage line can contain only one rotating asset. You can select from a list of rotating items to meet the required quantity on the inventory usage line. The total quantity must be less than or equal to the quantity on the corresponding usage line. You can also automatically add rotating items to the record by clicking Auto-Split.

---

## Auto-Split feature

You can eliminate the manual process of selecting multiple storage bins or individual rotating assets, by selecting Auto-Split from the Split Usage Quantity window.

The Auto-Split feature checks the following item attributes and assigns the available stocked items:

- A lotted item is requested. The inventory balances are sorted by the USEBY date, and the closest expiring lot items are selected. Subsequent expiring lots are allocated to the inventory usage line until the quantity is met.
- A non-rotating item or non-lotted item is requested. If the quantity of the default bin is insufficient, the Split Usage Quantity window opens and the bins are listed by the balance in ascending order. The listed bins are sourced in order until the quantity is met.
- A rotating item is requested and the quantity is more than one. The Auto-Split feature searches for all available rotating items and sorts the list in ascending order. The first available item is assigned to the first split line, and the second item is assigned to the second, until the quantity of the inventory usage line is satisfied.

---

## Issues, transfers, and returns in inventory

Organizations consume the items and tools in inventory storerooms in different ways. Issues, transfers, and returns are methods for monitoring and controlling the movement and consumption of inventory items and tools.

You create inventory usage records to track the issue, transfer, and return of inventory items within and across organizations. You can also make quick issues and transfers of inventory as you work.

You use inventory usage records for the following tasks:

#### Issuing items

You can issue inventory items or tools by assigning them to a work order, to an asset, to an operating location, or to a general ledger (GL) account. You can also issue items to satisfy reservations, such as for use on a work order. Items can be issued to a charging entity that belongs to the same site or across sites within an organization.

#### Transferring items

You can transfer inventory items or tools from one storeroom to another storeroom to satisfy the requirement for the items in another location. You can move inventory stock between storerooms located in two different sites of the same organization, or between sites that belong to separate organizations.

#### Returning items

You can return inventory items to the original storeroom. For example, you can return parts that were previously issued from a storeroom, but were not used.

---

## Staging items for issue or transfer

You can reserve inventory items and store them in a stage bin before they are issued or transferred. By setting the status of the inventory usage record to Staged, you can ensure that the correct quantity of inventory stock is held until it can be moved to its destination.

---

### Before you begin

You must specify the general ledger accounts on the inventory usage record before the status can be changed to Staged.

---

### Procedure

1. From the Inventory Usage tab of the Inventory Usage application, select the record for which you want to stage items for issue or transfer.
2. Change the status of the inventory usage record to Staged.
3. In the Change Status window, select from the stage bin options and save the record.

---

## Transferring inventory items by shipment

You use shipments to transfer inventory items or tools between storerooms within an organization. Shipment records monitor information about the transfer of items from an inventory storeroom and the receipt of the same items at the destination site or storeroom.

---

### About this task

You can create shipment records for transfer records that have either Entered status or Staged status. You use the Shipment Receiving application to record the receipt of shipped items. When you ship items to a location within the same site, purchase orders are not required.

---

### Procedure

1. From the Inventory Usage tab of the Inventory Usage application, select the transfer record for which you want to create a shipment.
2. Click Set inventory usage record to Shipped status and change the status of the inventory usage record to Shipped.
3. In the Create Shipment window, specify the shipment information and save the record.

---

## Splitting the quantity on an inventory usage line

When an inventory usage line specifies an item quantity that exceeds the number of items in the primary storage bin, you must split the line across multiple bins to meet the required quantity.

---

### Procedure

1. On the Split Usage Quantity window, select the line for the item quantity that exceeds the current available balance.
2. Choose from the following options:

Option	Description
<b>Non-rotating items</b>	If the item is a non-rotating item, select New Row under the Split Across Multiple Bins table window. Specify the additional bins to source for the items on the inventory usage line.
<b>Rotating items</b>	If the item is a rotating item, select New Row under the Select Rotating Assets table window. Specify the rotating items to allocate to the inventory usage line.

3. Click OK.

---

## Shipment Receiving

In a large organization, you can transfer inventory items or tools between storerooms within the same site or across sites and organizations and track their delivery. You create shipment receipt records to acknowledge the receipt of transferred items and update inventory balances at the destination storeroom.

You create shipment receipt records to log information such as the quantity of items that were received, the date the items were received, and the destination storeroom for the shipment.

When the shipped items are received, the storeroom balance is updated for the inventory records at the destination site. The quantity of received items is also verified to determine whether the number of shipped items satisfies the requirement at the destination site. The shipment is considered to be complete or partial based on this requirement, and the inventory usage record is updated according to this status.

- [Shipment inspection statuses](#)  
A site or organization can specify that an inspection is required upon receipt of inventory items. The inspection status indicates the stage of inspection that applies to the shipment item.
- [Rules for voiding shipment receipts](#)  
You can void a shipment receipt transaction that was created in error. When you void a shipment receipt, the record returns to its former state and storeroom balances are resolved.

---

## Shipment inspection statuses

A site or organization can specify that an inspection is required upon receipt of inventory items. The inspection status indicates the stage of inspection that applies to the shipment item.

The following statuses apply to shipment items that undergo an inspection:

Status	Description
Waiting for Inspection (WINSP)	Indicates that the item is in the process of being received, but is not entered into inventory. The item is in a holding location, where it stays until the inspection is complete. After inspection, the item status changes to either Waiting for Serialization or Complete, depending on whether it is a rotating item.
Waiting for Serialization (WASSET)	Indicates that the item is a rotating item and that review and acceptance of the asset numbers in the receipt is required. If the item requires inspection, the inspection has already occurred. The item is still in the holding location; it has not been sent to its destination storeroom or to its direct issue location. After the item is serialized, the status is changed to Complete.
Complete (COMP)	Indicates that the item was received, and if necessary, inspected and serialized. When the status of the item changes to Complete, a transfer transaction is created. The item is transferred to the appropriate storeroom or to a direct issue location. If the item is not rotating and does not require inspection, its status is Complete when it is received.

---

## Rules for voiding shipment receipts

You can void a shipment receipt transaction that was created in error. When you void a shipment receipt, the record returns to its former state and storeroom balances are resolved.

A voided receipt has the same effect on storeroom balances as a return, but a voided receipt cannot be used on a credit invoice.

The following conditions apply to voiding shipment receipts:

- You can void non-rotating items.
- You can void shipment line items that are in Waiting for Inspection (WINSP) status.
- You can void shipment line items that have been inspected but not returned.

---

## Condition Codes

You use the Condition Codes application to build the master list of condition codes for a particular item set.

---

## Using condition codes

Condition codes are used to manage your inventory by tracking the value of each item. Each time an item is issued, transferred, or returned, you specify the physical condition of the item based on codes that you set up. You use the Inventory application to manage condition-enabled items. After you set up the master list of condition codes in the Condition Codes application, use the Item Master application to specify items as condition-enabled.

If you mark an item as condition-enabled, you must assign at least one condition code to it. For each condition-enabled item, one condition code must have a full-value rate of 100%. This condition code is used as the reference point to calculate values for any other condition codes for this item.

---

## Example: Condition codes and rates

The following condition codes and their corresponding condition rates might be established at a transportation company for tire tread depth:

- 9/16" (condition rate = 100%)

- 15/32" (condition rate = 80%)
- 11/32" (condition rate = 60%)
- Casing (condition rate = 20%)
- [Condition codes overview](#)  
Condition codes track the value of items in your inventory. Condition codes are expressed in percentages. The new condition indicates that the value is worth 100% of its value.
- [Creating condition codes](#)  
You use the Condition Codes application to build the master list of condition codes for a particular item set. You manage your inventory by using condition codes to track the worth of each item in a set. An organization is assigned to one item set, and multiple organizations can use the same item set.

---

## Condition codes overview

Condition codes track the value of items in your inventory. Condition codes are expressed in percentages. The new condition indicates that the value is worth 100% of its value.

- [Condition rates](#)  
Condition rates signify the value of an item, and are expressed as a percentage. A condition code of NEW equates to 100 percent as the condition rate, while a condition code of FAIR might have 50 percent as the condition rate. For each condition-enabled item, one condition code must have a full-value rate of 100%.
- [Condition-enabled items](#)  
A condition-enabled item has a value or worth you want to assign and track based on its physical condition. You can apply different rates to an item as its condition changes from use, such as from new to used. When you create an item in the Item Master application, you can select the Condition Enabled check box if you plan to apply one or more conditions to the item.
- [Types of enablement](#)  
The condition of an item is specified using the Condition Enabled field of the Item Master application. When you categorize an item as being condition-enabled, the value is based on the physical condition of that item. You use the Condition Codes application to apply one or more condition codes to items. Items that are not classified based on their condition do not have condition codes attached to them.
- [Item sets](#)  
Item sets let multiple organizations within a company view and choose from a common set of items stocked in the storeroom. An organization can be associated with only one item set. However, multiple organizations can use the same item set.

---

## Condition rates

Condition rates signify the value of an item, and are expressed as a percentage. A condition code of NEW equates to 100 percent as the condition rate, while a condition code of FAIR might have 50 percent as the condition rate. For each condition-enabled item, one condition code must have a full-value rate of 100%.

---

## Condition-enabled items

A condition-enabled item has a value or worth you want to assign and track based on its physical condition. You can apply different rates to an item as its condition changes from use, such as from new to used. When you create an item in the Item Master application, you can select the Condition Enabled check box if you plan to apply one or more conditions to the item.

Before you can assign condition codes to items, you must create the codes in the Condition Codes application. You define condition codes at the item set level, which makes them available to any item records in that item set. One condition code must be at a full-value (100%) rate, and any other codes you create will be a percentage of that. For example, you might establish the following condition codes (and their corresponding rates) at a transportation company for Tire Model T100:

- New (condition rate 100%)
- Good (condition rate 80%)
- Retread (condition rate 40%)
- Fair (condition rate 40%)
- Poor (condition rate 10%)

If you mark an item as condition enabled, you must assign at least one condition code to it. For each condition-enabled item, one condition code must have a "full-value" rate of 100%. The system uses this condition code as the reference point to calculate values for any other condition codes for this item. Therefore, if you associate only one condition to an item, it must be a full-value 100% rate. For example, a tire is new and the cost is \$60.00. The system calculates the cost of a tire with a status of Fair to be \$24.00 (which is \$60.00 multiplied by the .40 Fair rate). When you mark an existing item as condition-enabled, you are required to add the condition code(s) and then the system applies the full-rate condition code to any inventory records that exist for that item.

You can remove a condition code from an item before you add the item to a storeroom. However, after you add a condition-enabled item to a storeroom, the system creates an inventory record and preserves the condition code. When you add a condition-enabled item to a storeroom, the system, by default, applies the full-value condition code with the 100% rate. You can edit the cost and balance information in the Add Items to Storeroom dialog box, as needed. However, as the system only adds the full rate condition code to the storeroom, you still must add any additional condition codes for the item manually in the Inventory Application.

---

## Types of enablement

The condition of an item is specified using the Condition Enabled field of the Item Master application. When you categorize an item as being condition-enabled, the value is based on the physical condition of that item. You use the Condition Codes application to apply one or more condition codes to items. Items that are not classified based on their condition do not have condition codes attached to them.

---

## Item sets

Item sets let multiple organizations within a company view and choose from a common set of items stocked in the storeroom. An organization can be associated with only one item set. However, multiple organizations can use the same item set.

You identify an item set with a unique name or number, and each item that belongs to the item set has a unique item number.

When you create an organization, you associate an item set to it. When you create an item, by default the item is placed into the item set associated with the organization for your default insert site.

---

## Creating condition codes

You use the Condition Codes application to build the master list of condition codes for a particular item set. You manage your inventory by using condition codes to track the worth of each item in a set. An organization is assigned to one item set, and multiple organizations can use the same item set.

---

### About this task

If you mark an item as condition-enabled, you must assign at least one condition code to it. For each condition-enabled item, one condition code must have a full-value rate of 100%. The condition code with the full-value rate of 100% is used as the reference point to calculate values for any other condition codes for this item.

---

### Procedure

1. From the Condition Codes application, select the item set for which you want to create a condition code.
2. Click New Row and type a name and a description for the condition code.  
One code for the full value, or 100% rate, is required.
3. In the Condition Rate field, type a percentage that indicates the condition of the item, and save the condition code.

---

### What to do next

After you build the master list of condition codes, set up condition-enabled items using the Item Master application, and manage condition-enabled item balances using the Inventory application.

---

## Storerooms

You use the Storerooms application to add and maintain information about storeroom locations, as well as view the items stocked within a storeroom. You also use this application to associate the general ledger accounts with each storeroom, define the lead time calculation for items in a storeroom, and flag the storeroom to function as an internal supplier to other storerooms.

---

### Reorder storeroom

You can also specify that all the items in a storeroom are reordered from only one storeroom. In the Storerooms application, you select the Select Reorder Storeroom action and specify a reorder storeroom and a reorder site. When you specify a reorder storeroom, you do not have to manually specify reorder settings, such as a vendor, in the inventory record for each item in the current storeroom.

---

### Storeroom hierarchies

You can create a storeroom hierarchy by specifying parent storerooms. The parent storeroom must have the same organization and site as the current storeroom and cannot be a descendant of the current storeroom. Storeroom hierarchies can be useful when you want to apply a change to multiple storerooms at once, such as adding items to multiple storerooms.

- [Storerooms overview](#)  
You can add and maintain information about storeroom locations, and view the items stocked within a storeroom. You can also associate the general ledger accounts with each storeroom, define the lead time calculation for items in a storeroom, and flag the storeroom to function as an internal supplier to other storerooms.
- [Working with storerooms](#)  
You can add and delete storerooms as a means of tracking where your inventory is stored and from where it is issued. You can issue items internally from the default storeroom, and change the lead time calculations to analyze vendors and determine when to reorder items.

---

## Storerooms overview

You can add and maintain information about storeroom locations, and view the items stocked within a storeroom. You can also associate the general ledger accounts with each storeroom, define the lead time calculation for items in a storeroom, and flag the storeroom to function as an internal supplier to other storerooms.

- [Control accounts and storerooms](#)  
The Storerooms application contains two control accounts that are used for items and tools. The general ledger control account is the control account for inventory items, and the tool control account applies only to tools.
- [Lead time calculations for storerooms](#)  
Lead time is the time between when an item is ordered and when it is received. When items are received, a lead time calculation is used to update the lead time on the inventory record.

---

## Control accounts and storerooms

The Storerooms application contains two control accounts that are used for items and tools. The general ledger control account is the control account for inventory items, and the tool control account applies only to tools.

When you create a storeroom, you specify its general ledger and control accounts. You use the general ledger accounts to track financial transactions for a storeroom location.

When you add an item to a storeroom (into inventory), the account number defaults to the inventory record that is created. When you add a tool to a storeroom (as a stocked tool), the account number defaults to the stocked tool record that is created.

---

## Lead time calculations for storerooms

Lead time is the time between when an item is ordered and when it is received. When items are received, a lead time calculation is used to update the lead time on the inventory record.

You can use lead times as a factor to analyze vendors and determine the time to reorder items in the reorder routine.

For a given storeroom, the Recent Lead Time Weight in % is the weight in percent given to the most recent receipt of an order. You can give the most recent record more (or less) importance in the calculation of lead time. You can weigh the lead time calculation by specifying that a certain percent of the calculation is based on the most recent receipt for that inventory item, while the remaining percentage (the difference) is assigned automatically to the original lead time, or the lead time that is currently set for the inventory item.

---

## Working with storerooms

You can add and delete storerooms as a means of tracking where your inventory is stored and from where it is issued. You can issue items internally from the default storeroom, and change the lead time calculations to analyze vendors and determine when to reorder items.

- [Adding storeroom locations](#)  
Storeroom locations are the names of your inventory storerooms, the places inventory items are stored in and issued from. You use the Storerooms application to add new storeroom locations.
- [Deleting storeroom locations](#)  
To manage the storerooms that you created, you use the Storerooms application to delete a storeroom location.
- [Changing lead time calculations for storerooms](#)  
Lead time is the time between when an item is ordered and received. To analyze vendors and determine when to reorder items, you can change how lead times are calculated.
- [Specifying storerooms on purchase orders and purchase requisitions](#)  
You use the Storerooms application to specify whether you want a storeroom to internally supply and reserve inventory items for use with internal purchase requisitions and internal purchase orders.

---

## Adding storeroom locations

Storeroom locations are the names of your inventory storerooms, the places inventory items are stored in and issued from. You use the Storerooms application to add new storeroom locations.

---

## Procedure

1. In the Storerooms application, click the New Storeroom icon.
2. Enter a location and description.
3. Optional: Specify values for the general ledger account codes.
4. Optional: In the Recent Lead Time Weight in % field, enter the percent value for the weight given to the most recent order to calculate the lead time of the inventory item.
5. Optional: In the Ship To Labor field and Ship To Address field, select the shipping labor code and address information.
6. Optional: In the Bill To Labor field and Bill To Address field, select the billing labor code and address information.
7. To designate the storeroom as the default storeroom for the site, select the Default Storeroom check box.
8. To use this storeroom to supply items for use with internal purchase requisitions and purchase orders, select the Use in PO/PR check box.

9. Click the Save Storeroom icon to create a storeroom location.

---

## Deleting storeroom locations

To manage the storerooms that you created, you use the Storerooms application to delete a storeroom location.

### Before you begin

---

You cannot delete a storeroom if items or tools are stocked in it.

### Procedure

---

1. In the Storerooms application, select the storeroom location that you want to delete.
2. Select the Delete Storeroom action.
3. Click Yes to delete the storeroom that you selected.

---

## Changing lead time calculations for storerooms

Lead time is the time between when an item is ordered and received. To analyze vendors and determine when to reorder items, you can change how lead times are calculated.

### Procedure

---

1. In the Storerooms application, select a storeroom.
2. In the Recent Lead Time Weight in % field, enter a value. You can specify different lead time weights for different storeroom locations.
3. Save your changes.

### Results

---

When you change this calculation, the weight in percent used for the current inventory lead time is automatically considered 100% minus the value in the Recent Lead Time Weight in % field.

### Example

---

For a storeroom, the Recent Lead Time Weight in % is set to 20%. A quantity of 100 items is ordered, for which the item has an existing lead time of 30 days. The entire shipment is received in 20 days (recent lead time). The inventory item's lead time recalculates based on the recent receipt of the item as follows:  
 $0.20 (20 \text{ days}) + 0.80 (30 \text{ days}) = 28 \text{ days}$   
28 days become the recalculated lead time for the inventory items. When the item is reordered, 28 is the value for inventory item's existing lead time.

---

## Specifying storerooms on purchase orders and purchase requisitions

You use the Storerooms application to specify whether you want a storeroom to internally supply and reserve inventory items for use with internal purchase requisitions and internal purchase orders.

### Procedure

---

1. In the Storerooms application, open or add a storeroom location.
2. On the Storeroom tab, select the Use in PO/PR check box.
3. Click the Save Storeroom icon to make the storeroom available as an internal supplier in the Purchase Orders and Purchase Requisition applications.

---

## IT Infrastructure module

The IT Infrastructure module (configuration process manager) applications enable management of the configuration items in your IT environment. They provide a logical model of the IT infrastructure by helping you to identify, control, maintain, and verify the versions of all configuration items in the environment and their attributes and relationships.

- **Configuration Items**  
You use the Configuration Items application to define, create, and manage relationships among configuration items according to relationship rules that you specify in the Relationships application. A configuration item is any component of an information technology infrastructure that is controlled by configuration management.
- **Relationships**  
A relationship uses basic terms to describe the dependency or connectivity between configuration items. The basic terms include runs on, installed on,

contained, and so forth.

- **Collections**

You can create collections of records such as configuration items, assets, and locations to make the records easier to access and manage in other applications. In the Collections application, you can create, view, change, or delete collections.

---

## Configuration Items

You use the Configuration Items application to define, create, and manage relationships among configuration items according to relationship rules that you specify in the Relationships application. A configuration item is any component of an information technology infrastructure that is controlled by configuration management.

In the Configuration Items application, you can manage configuration item collections, and you can create service requests, incidents, problems, work orders, changes, and releases for the configuration item.

Configuration items vary in complexity, size, and type. A configuration item can be a complete service, including all hardware, software, documentation, and so on. The smallest unit for a configuration item is typically the smallest component that you change independently of other configuration items, such as a minor hardware component.

In practice, most configuration items with which you deal are at a higher level, including assets, services, items, and locations. Some configuration items can be physical locations, such as a data center. Discovery tools typically do not find these configuration items; you can associate them with location records.

You can use discovery tools to locate and characterize some configuration items. Discovered configuration items are called actual configuration items. You can view them in the Actual Configuration Item application.

When you work with configuration items, the following things apply:

- Configuration items are managed individually, and are typically treated as self-contained units for identification and change control purposes.
- Configuration items are identified uniquely with names and other attributes.
- The lowest level configuration item is typically the smallest unit that are changed independently of other components.

---

## Creating configuration items

In the Configuration Items application, you create the configuration items that you want to be under configuration management and change control. The configuration items that you create are sometimes referred to as authorized configuration items, or simply, CIs.

You often create a CI based on the database record of an actual configuration item, or actual CI, that was created by a discovery tool. The record you create in the Configuration Items application, however, is the authorized version of the actual CI in the Actual Configuration Items application.

---

## Creating records for configuration items

In the Configuration Items application, you can create the following kinds of records for a CI:

- Service requests
- Incidents
- Problems
- Work order
- Changes
- Releases

---

## Associating configuration items

You can associate, or link, a CI with another record, such as an asset, location, item, service, or service group. You can associate an actual CI with an authorized CI in the following ways:

- In the Configuration Items application, you can create an authorized CI and associate it with an actual CI.
- In the Configuration Items application, you can associate an existing authorized CI with an actual CI.
- In the Actual CI application, you can create an authorized CI (a new record in the Configuration Items application) by selecting an actual CI and specifying a classification.

Not all CIs have an association with other records.

---

## Comparing attributes of associated configuration items

When an authorized CI, the "as planned" version of the CI, is associated with an actual CI, the "as built" (or discovered) version of the CI, the values of their attributes should match. Any mismatches need to be investigated for cause and corrected. The Configuration Items application provides a comparison feature where such mismatches are highlighted. When any currently displayed authorized CI is associated (linked) with an actual CI, you can view an attribute comparison of the two CIs in the Specifications table, where any discrepancies in their attribute values are highlighted.

From the Specifications table on CI Details tab, you can view any attribute discrepancies that exist between the currently displayed, authorized CI and its associated actual CI (if one exists). If a CI is at present linked to an existing actual CI, the Specifications table adds a Discovered Variance column (for the actual CI) next to the Authorized Value column (for the authorized CI). These columns present a side-by-side, authorized-vs.-discovered comparison of the values for the complete set of authorized attributes.

Here is how the attribute comparison works:

- If the attribute values of the two CIs match one another, the matched value is displayed in the Authorized Value column only.

- If the values do not match, the two mismatches are displayed *and highlighted* in each column.
- If a mismatched *discovered* value is a value of null or "empty," the text `No Discovered Value` is displayed in the Discovered Variance column and the data in both columns are highlighted.

Note: If an authorized CI attribute has no corresponding attribute at all in the actual CI, nothing is displayed in the Discovered Variance column and nothing is highlighted. Here the attribute is treated as an extra attribute in the authorized CI, not a variance. That is, sometimes an attribute is intentionally added to an authorized CI, but not to the actual CI, so it cannot be discovered and imported as an attribute of the actual CI.

Maintaining consistency between the actual and authorized versions of your CIs is part of controlling your IT environment. It ensures that your Content Management System accurately reflects your physical and logical infrastructure. The attribute comparison in the Specifications table provides you with quick visibility of attribute mismatches, so that you can take steps to correct them. This comparison can bring to your attention possible incongruities or unauthorized changes to a CI, or even validate that an approved change request to reconcile identified mismatches between attribute values was completed as expected.

- [Configuration items management](#)  
You can search for and import configuration item types into the asset management database as a way to filter data. You can view attributes, relationships, relationship rules, and classifications for configuration item types. You can also view configuration type instances for the configuration item types you import.
- [Working with configuration items](#)  
You create configuration items that you want to keep under configuration management and change control. You can manage relationships among configuration items according to relationship rules that you specify in the Relationships application. You can also create records for a configuration item and associate a configuration item with another record.

---

## Configuration items management

You can search for and import configuration item types into the asset management database as a way to filter data. You can view attributes, relationships, relationship rules, and classifications for configuration item types. You can also view configuration type instances for the configuration item types you import.

---

## Configuration item discovery

You use the discovery tool to find configuration items that exist in your information technology infrastructure.

You can use the settings in the discovery tool to specify the types of configuration items to search for. Some examples of configuration items include: computers, systems, routers, and switches. The discovered configuration items reside in the discovery tool database, including configuration item types.

---

## Configuration item data import

You use Integration Composer and the IBM® Tivoli® Integration Adapter to import data from the discovery engine. You can import the data in two stages:

### Stage 1

You import configuration item types as classifications, including their attributes and relationships, and the relationship rules between various configuration item types. You can view the classifications and attributes in the Classifications application. You can view relationships and relationship rules in the Relationships application. You can also view the list of configuration item types in the Configuration Item Types application.

You can manage only a subset of the configuration items that the discovery tool finds. In the Configuration Item Types application, you can select the configuration item types that you want to manage under configuration management and change control. The import process in stage 2 imports only the configuration item types that you select.

### Stage 2

You import configuration item instances into the Actual Configuration Items application. The import brings only the configuration items that are associated with the configuration item types that you selected in the Configuration Item Types application. Selecting configuration item types is a way to filter the data. The import process also brings the relationships that exist between the various configuration items.

---

## Authorized configuration item creation

Configuration management and change control processes do not operate on actual configuration items. Instead, they operate as authorized configuration items which are items that conform to rules and relationships that you define in the Configuration Items application.

When you create an authorized configuration item, it can be linked to an actual configuration item record. You can also create an authorized configuration item that is independent of any actual configuration item record, because not all configuration items need to work with the discovery engine. You can create a link between the authorized configuration item and the actual configuration item in the Configuration Items and Actual Configuration Items applications.

You can create an authorized classification hierarchy that maps to an actual classification hierarchy. Partial mappings can exist between the two classifications, rather than a complete mirror image. You can use the Manage CI Hierarchies action in the Classifications application to define the configuration item hierarchies.

- [Status of configuration item types](#)  
The status of a configuration item type determines whether actual configuration items associated with that type are imported into the Actual Configuration Items application.
- [Actual configuration items](#)  
An actual configuration item is an item that is loaded into the Actual Configuration Items application from the discovery engine using the IBM Tivoli Integration Composer. You can load configuration items into the database from a discovery engine or an asset management database. First load your configuration item data into the discovery engine using the bulk loader interface.
- [Configuration item collections](#)  
In the Configuration Items application, you can associate collections with a configuration item.
- [Configuration item changes](#)  
When you create configuration items, you can change them to suit your business needs.
- [Configuration item statuses](#)  
You can change the status of configuration item records to suit your business needs.

- [Configuration item deletion](#)  
You can either delete or decommission a configuration item.

---

## Actual configuration items

An actual configuration item is an item that is loaded into the Actual Configuration Items application from the discovery engine using the IBM® Tivoli® Integration Composer. You can load configuration items into the database from a discovery engine or an asset management database. First load your configuration item data into the discovery engine using the bulk loader interface.

- [Actual configuration item details](#)  
For configuration items that are based on actual configuration items, you can use the Configuration Items application to view detailed information that is in the Actual Configuration Items application.

---

## Actual configuration item details

For configuration items that are based on actual configuration items, you can use the Configuration Items application to view detailed information that is in the Actual Configuration Items application.

You use the View Actual CI Details action to view the classification, global unique identifier (GUID), and last scan date of an actual configuration item, as well as the attributes associated with the classification. This information is read only.

You can use the Actual CI field of the configuration item to access additional information in the Actual Configuration Items application.

---

## Configuration item collections

In the Configuration Items application, you can associate collections with a configuration item.

To associate collections of configuration items with a specific configuration item, you use the Manage CI Collections action.

For example, you have a collection that includes a group of configuration items in a data center that you want to associate with a specific configuration record.

---

## Configuration item changes

When you create configuration items, you can change them to suit your business needs.

When you change fields, and add or delete rows, the following rules apply:

- The value in one field can determine if you can change the value in another field.
- If you change the classification, the attributes reflect the new classification.
- If the configuration item is protected, you might not be able to change the value of an attribute.

---

## Configuration item statuses

You can change the status of configuration item records to suit your business needs.

You use the Change Status action to change the status of configuration items. A configuration item can have these statuses:

- Not ready - When you create a configuration item, it has a status of not ready.
- Operating - This status indicates that the configuration item is currently being used.
- Decommissioned - Configuration items that have been decommissioned cannot be used in new records. You can access a decommissioned configuration item only in the Configuration Items application. Decommissioned configuration items are not displayed in Select Value windows.

You configure the list of applicable statuses for a configuration item in the CI Lifecycle application.

---

## Configuration item deletion

You can either delete or decommission a configuration item.

You use the Delete action to delete a configuration item. You cannot delete a configuration item if it is used on any other record.

Instead of deleting a configuration item, you can change the status of the configuration item to decommissioned. Decommissioning a configuration item makes the item inaccessible in all other applications.

---

## Working with configuration items

You create configuration items that you want to keep under configuration management and change control. You can manage relationships among configuration items according to relationship rules that you specify in the Relationships application. You can also create records for a configuration item and associate a configuration item with another record.

- [Creating configuration items](#)  
You create configuration items to establish relationships and groupings of infrastructure components in information technology for configuration management and change control.
- [Creating records in configuration items](#)  
You can create records in the Configuration Items application without accessing the Service Desk applications.
- [Specifying relationships between configuration items](#)  
To manage your configuration item collection, you can specify relationships between one configuration item and another configuration item.
- [Adding configuration items to collections](#)  
To manage configuration items, you can add one or multiple configuration items to collections.
- [Viewing the business application topology for actual configuration items](#)  
To view a graphical representation of the relationships of business applications that are associated with actual configuration items, you view the business application topology for an actual configuration item.

---

## Creating configuration items

You create configuration items to establish relationships and groupings of infrastructure components in information technology for configuration management and change control.

---

### Procedure

1. In the Configuration Items application, click New CI.
2. Provide a name for the configuration item.
3. Optional: Provide a description for the configuration item.
4. Optional: Specify these values for the configuration item:

Option	Description
<b>Classification</b>	<ul style="list-style-type: none"><li>• Associate the configuration item with a classification.</li></ul>
<b>Actual CI</b>	<ul style="list-style-type: none"><li>• Base the configuration item on an actual configuration item.</li><li>• If the Classification field is blank when you specify the value for the actual configuration item, the classification and attributes from the actual configuration item are used.</li></ul>
<ul style="list-style-type: none"><li>• <b>Asset</b></li><li>• <b>Location</b></li><li>• <b>Item</b></li><li>• <b>Service</b></li><li>• <b>Service Group</b></li></ul>	<ul style="list-style-type: none"><li>• Associate the configuration item with an asset, location, item, service, or service group.</li><li>• Some associations preclude making other associations. For example, if you associate the configuration item with an asset, the Location field, Item field, and Service field become read-only.</li></ul>
<ul style="list-style-type: none"><li>• <b>CI</b></li><li>• <b>Location</b></li><li>• <b>Site</b></li><li>• <b>Organization</b></li><li>• <b>Item Set</b></li><li>• <b>Calendar</b></li><li>• <b>Shift</b></li></ul>	<ul style="list-style-type: none"><li>• Specify values for the location of the configuration items, the site, the organization, the item set, the calendar, and the shift.</li><li>• Some values preclude specifying other values.</li></ul>
<b>CI Owner</b>	<ul style="list-style-type: none"><li>• Specify an owner for the configuration item.</li></ul>

5. To add attributes, click New Row.  
To add attributes, you must associate the configuration item with a classification.
6. In the Attribute field, specify a value.
7. Optional: Provide information for the remaining fields.
8. Save your changes.

---

## Creating records in configuration items

You can create records in the Configuration Items application without accessing the Service Desk applications.

---

### Procedure

1. In the Configuration Items application, select the configuration item for which you want to create a record.
2. Select the [Create > Record Type](#) action where *Record Type* is one of the following record types:
  - Service Request
  - Incident
  - Problem

- Change
  - Release
  - Work Order
  - Solution
  - Communication
3. Save the record.

## Specifying relationships between configuration items

To manage your configuration item collection, you can specify relationships between one configuration item and another configuration item.

### Before you begin

You specify relationships in the Relationship application.

### Procedure

1. In the Configuration Items application, display the configuration item for which you want to specify a relationship.  
This configuration item is the current configuration item.
2. Click the Related CIs tab.
3. Click New Row.
4. Specify values for the source configuration item and the target configuration item.  
The current configuration item can be either a source or target configuration item.  
If you specify a configuration item that is not the current record in one of the fields, the other field displays the current configuration item.
5. Specify a value for the relationship.  
If both configuration items are associated with classifications, the relationship must be valid. If the relationship is not valid, you receive an error message.
6. Use the Containment check box to determine if there is a containment relationship between the source and target configuration items.  
The Containment check box is read only.
7. Save your changes.

### Example

You can specify that a particular software program is installed on a particular computer.

## Adding configuration items to collections

To manage configuration items, you can add one or multiple configuration items to collections.

### Procedure

1. On the List tab in the Configuration Items application, select the Select Records check box.
2. Select the configuration items that you want to add to the collection.
3. Select the Add CIs to Collections action.
4. In the Add CIs to Collections window, specify a value for the collection.
5. Click OK.

## Viewing the business application topology for actual configuration items

To view a graphical representation of the relationships of business applications that are associated with actual configuration items, you view the business application topology for an actual configuration item.

### Before you begin

To view the business application topology, you open a discovery tool, such as IBM® Tivoli® Application Dependency Discovery Manager. You can view the business application topology for actual configuration items that are associated with configuration items.

### Procedure

1. In the Configuration Items application, select the configuration item that is associated with the actual configuration item.
2. Select the View Actual CI Topology > Business Application action.
3. To view the topology, perform one of the following steps:

Option	Description
If the actual configuration item is associated with one operational management product	View the topology.

Option	Description
<b>If the actual configuration item is associated with multiple operational management products</b>	a. Specify an operational management product. b. Click OK. c. View the topology.

4. Close the discovery tool to return to the Configuration Items application.

- [Viewing the application topology for actual configuration items](#)

To view a graphical representation of the relationships of applications that are associated with actual configuration items, you view the application topology for an actual configuration item.

- [Viewing the physical topology for actual configuration items](#)

To view a graphical representation of the relationships that are associated with actual configuration items, you view the physical topology for an actual configuration item.

## Viewing the application topology for actual configuration items

To view a graphical representation of the relationships of applications that are associated with actual configuration items, you view the application topology for an actual configuration item.

### Before you begin

To view the application topology, you open a discovery tool, such as IBM® Tivoli® Application Dependency Discovery Manager. You can view the application topology for actual configuration items that are associated with configuration items.

### Procedure

1. In the Configuration Items application, select the configuration item that is associated with the actual configuration item.
2. Select the View Actual CI Topology > Application action.
3. To view the topology, perform one of the following steps:

Option	Description
<b>If the actual configuration item is associated with one operational management product</b>	View the topology.
<b>If the actual configuration item is associated with multiple operational management products</b>	a. Specify an operational management product. b. Click OK. c. View the topology.

4. Close the discovery tool to return to the Configuration Items application.

## Viewing the physical topology for actual configuration items

To view a graphical representation of the relationships that are associated with actual configuration items, you view the physical topology for an actual configuration item.

### Before you begin

To view the physical topology, you open a discovery tool, such as IBM® Tivoli® Application Dependency Discovery Manager. You can view the physical topology for actual configuration items that are associated with configuration items.

### Procedure

1. In the Configuration Items application, select the configuration item that is associated with the actual configuration item.
2. Select the View Actual CI Topology > Physical action.
3. To view the topology, perform one of the following steps:

Option	Description
<b>If the actual configuration item is associated with one operational management product</b>	View the topology.
<b>If the actual configuration item is associated with multiple operational management products</b>	a. Specify an operational management product. b. Click OK. c. View the topology.

4. Close the discovery tool to return to the Configuration Items application.

## Relationships

A relationship uses basic terms to describe the dependency or connectivity between configuration items. The basic terms include runs on, installed on, contained, and so forth.

You define and work with relationships in these ways:

- In the Relationships application, you create the formal definitions and accompanying rules for relationships.

- In the Configuration Items application, you associate configuration items with each other using the relationships that you define in the Relationships application.

When you create relationships you specify several properties and rules, including these properties:

- **Directionality** - The directionality of a relationship affects what is found when a user searches for configuration items that are based on relationships. Relationships can be unidirectional, such as installed on or bidirectional.
- **Complementarity** - If a relationship is complementary, one relationship implies another relationship. For example, the relationship of operating system A to computer B is installed on. This relationship implies that the relationship of computer B to operating system A is installed with.
- **Cardinality** - This property specifies whether you can have multiple configuration items as the source and the target. For example, an operating system can be installed on many computers, which is a one-to-many relationship. In addition, a computer can have a one-to-one relationship, which means that the computer runs one operating system.
- **Containment** - This property specifies whether there is a parent-child relationship between configuration items.
- [Relationships overview](#)  
A relationship describes the dependency or connectivity between configuration items. A relationship can be unidirectional or bidirectional. Rules exist for changing or deleting relationships.
- [Creating relationships](#)  
You create relationships to define rules that determine how assets or configuration items relate to each other. These rules affect how you deploy, manage, and search for assets and configuration items.
- [Defining asset relationship rules](#)  
You can apply rules to relationships by classification and attribute.

## Relationships overview

A relationship describes the dependency or connectivity between configuration items. A relationship can be unidirectional or bidirectional. Rules exist for changing or deleting relationships.

- [Unidirectional and bidirectional relationships](#)  
A relationship describes the dependency or connectivity between configuration items. A relationship can be either unidirectional or bidirectional. The results of a search are affected when relationships are bidirectional or unidirectional.
- [Asset-based relationships](#)  
A relationship describes the dependency or connectivity between assets. You can define relationships, such as `installed on` or `terminates`, and then apply them to relevant assets.
- [Relationship cardinality](#)  
Cardinality is when you define a relationship, and you specify whether one or more configuration items can be in the source classification and target classification.
- [Relationship change rules](#)  
You can change relationships to fit your business needs.
- [Deletion rules for relationships](#)  
You can delete relationships as your business needs change.

## Unidirectional and bidirectional relationships

A relationship describes the dependency or connectivity between configuration items. A relationship can be either unidirectional or bidirectional. The results of a search are affected when relationships are bidirectional or unidirectional.

### Unidirectional relationships

A unidirectional relationship is valid in only one direction. The following phrases are examples of unidirectional relationships: `installed on`, `installed with`, `contains`, `member of`, `starts from`, `resides on`, `succeeded by`, and `preceded by`.

For example, an operating system is installed on a computer. A computer is not installed on an operating system. However, in another type of unidirectional relationship, you can specify that a computer contains an operating system.

### Bidirectional relationships

A bidirectional relationship is valid in both directions. `Intersects` is an example of a bidirectional relationship.

## Search results

The distinction between unidirectional relationships and bidirectional relationships is important when you search configuration items based on relationships.

Relationship	Search results
Bidirectional	<ul style="list-style-type: none"> <li>• A user searches for all configuration items with an interfaces with relationship to application Z. Since interfaces with is a bidirectional relationship, the search program searches for these occurrences: <ul style="list-style-type: none"> <li>◦ The source configuration item is application Z and the relationship is interfaces with.</li> <li>◦ The target configuration item is application Z and the relationship is interfaces with.</li> </ul> </li> </ul>

Relationship	Search results
Unidirectional	<ul style="list-style-type: none"> <li>For unidirectional relationships, the search program searches for one combination. For example, a user searches for all configuration items with a member of relationship to an EMAIL SERVICE application, where EMAIL SERVICE is the target configuration item. The search program searches for the following occurrence: the target configuration item is EMAIL SERVICE and the relationship is member of.</li> <li>You can define one unidirectional relationship to be complementary to another unidirectional relationship. For example, in your relationship definition, you specify that installed on is complementary to installed with. A user wants to find all configuration items that are installed on AppServer K. The search program searches for these occurrences: <ul style="list-style-type: none"> <li>The target configuration item is AppServer K and the relationship is installed on.</li> <li>The source configuration item is AppServer K and the relationship is installed with.</li> </ul> </li> </ul>

## Asset-based relationships

A relationship describes the dependency or connectivity between assets. You can define relationships, such as `installed on` or `terminates`, and then apply them to relevant assets.

In the Relationships application, you create the formal definitions and accompanying rules for relationships.

In the Assets application, you associate assets with each other by using the relationships.

When creating a relationship between assets, you can define rules to validate that certain conditions are met. A relationship identifies a dependency or connectivity between two assets and the relationship rules validate the following criteria:

- Asset classifications, to ensure that only valid types of assets are related.
- Asset attributes, to ensure that certain values or conditions are met within a classification.

To accommodate complex validations, within a relationship definition multiple rules can be created, related, and grouped.

A relationship can contain none, one, or many validation rules. Each relationship rule consists of the following criteria:

- The classification requirement of the source asset.
- An attribute, a value, and a condition (equal to, less than, and so on) within the source asset classification.
- The classification requirement of the target asset.
- An attribute, a value, and a condition (equal to, less than, and so on) within the target asset classification.

Two or more relationship rules can be grouped together. Within a group, the validation requirement for the combination of rules is determined by the Within Group setting. This value determines whether all conditions must be met, or any one of them.

Similarly, there can be multiple groups of rules. Across all groups, at least one rule group validation condition must be met.

## Linear asset relationships

Asset relationships can be applied to point or linear assets. Linear assets can be defined as segments or layers, where you define an asset's location and how it relates to another.

Linear Asset Manager provides additional features for managing linear assets and is enabled under a separate license key. You must install a Linear Asset Manager license to use linear asset features.

When you are working with a linear asset in the Assets application, under the Relationships tab, you can enter additional linear data for an asset relationship, identifying the start and end measures for source and target assets.

Alternatively, you can select from a list of reference points for the source and target measures. Reference points are enabled by the Use as Reference check box and automatically populate the measures on subsequent reference point selections.

## Relationship cardinality

Cardinality is when you define a relationship, and you specify whether one or more configuration items can be in the source classification and target classification.

The following list describes the possible values of cardinality are:

- 1:n - one to many
- 1:1 - one to one
- n:n - many to many

The following table describes the cardinality values:

Cardinality	Relationship rules
-------------	--------------------

Cardinality	Relationship rules
1:n	<ul style="list-style-type: none"> <li>A configuration item that belongs to the source classification can have the relationship with multiple configuration items that belong to the target classification.</li> <li>A configuration item that belongs to the target classification can have the relationship with only one configuration item that belongs to the source classification.</li> <li>For example, you specify a 1:n cardinality for an installed with relationship between computer systems and operating systems. Therefore, a computer system instance can be installed with many operating system instances. This 1:n value also implies that an operating system instance can have an installed with relationship with only one computer system instance.</li> </ul>
1:1	<ul style="list-style-type: none"> <li>A configuration item that belongs to the source classification can have the relationship with only one configuration item that belongs to the target classification.</li> <li>A configuration item that belongs to the target classification can have the relationship with only one configuration item that belongs to the source classification.</li> <li>For example, you specify a 1:1 cardinality for a runs on relationship between operating systems and computer systems. Therefore, an operating system instance can run on only one computer system instance.</li> </ul>
n:1	<ul style="list-style-type: none"> <li>Multiple configuration items that belong to the source classification can have the relationship with only one configuration item that belongs to the target classification.</li> <li>A configuration item that belongs to the target classification can have the relationship with multiple configuration items that belong to the source classification.</li> <li>For example, you specify an n:1 cardinality for an installed on relationship between operating systems and computer systems. Therefore, multiple operating system instances can be installed on one computer system instance. This n:1 value also implies that an operating system instance can be installed on only one computer system instance.</li> </ul>
n:n	<ul style="list-style-type: none"> <li>Multiple configuration items that belong to the source classification can have the relationship with multiple configuration items that belong to the target classification.</li> </ul>

## Relationship change rules

You can change relationships to fit your business needs.

The following list describes the rules regarding changing relationships:

- You cannot change rules that are part of the common data model.
- You cannot delete the rule if any configuration items use the rule.
- You cannot change the containment flag if any configuration items use the rule.
- You cannot change the Is Target Parent setting if any configuration items use the rule.

You can change the cardinality in these ways:

- If 1:1, you can change the cardinality to 1:n, n:1, and n:n.
- If 1:n, you can change the cardinality to n:n.
- If n:1, you can change the cardinality to n:n.

If n:n, you cannot change the cardinality.

## Deletion rules for relationships

You can delete relationships as your business needs change.

You cannot delete a relationship when a relationship meets one of these conditions:

- The relationship is used to associate any configuration items.
- The relationship or relationship rule is imported.

## Creating relationships

You create relationships to define rules that determine how assets or configuration items relate to each other. These rules affect how you deploy, manage, and search for assets and configuration items.

### Procedure

- In the Relationships application, click the New Relationship icon.
- Select the type of relationship. Type defines the relationship as either `BIDIRECTIONAL` or `UNIDIRECTIONAL`.
- In the Use With field, enter or select `ASSET`, for asset relationships, or `CI`, for configuration item relationships.
- Optional: If the linear asset features are available, specify these options:
  - To use the relationship with linear assets, select Linear.
  - To use the relationship as a reference point in linear assets, select Is Reference Point.
- Optional: Specify a complementary relationship.

- Including a complementary relationship allows search programs to find instances of a configuration item when it is a source and when it is a target.
- Optional: Define asset or CI relationship rules.
  - Save the new relationship.

## Defining asset relationship rules

You can apply rules to relationships by classification and attribute.

### Before you begin

Ensure that classifications and attributes are defined and understand the relationship rule and group structure for validation purposes.

### Procedure

- In the Relationships application, select a relationship with Use With set to **ASSET**.
- In the Asset Relationship Rules table, click New Row.
- Select a source and target classification pair.
- For grouped rule validation purposes, select the Within Group condition; where **AND** indicates that all rules must be met and **OR** indicates that any one must be met.
- Optional: For the Source Classification and Target Classification definitions, enter or select a Source Attribute value.
- Optional: For the Source Classification and Target Classification, enter or select the source attribute Condition value, where:

Option	Description
<b>EQUALS</b>	True if the attribute data equals the value.
<b>NOTEQUAL</b>	True if the attribute data does not equal the value.
<b>GREATER</b>	True if the attribute data is greater than the value.
<b>GREATEROREQUAL</b>	True if the attribute data is greater than or equal to the value.
<b>LESS</b>	True if the attribute data is less than the value.
<b>LESSOREQUAL</b>	True if the attribute data is less than or equal to the value.
<b>LIKE</b>	True if the attribute data contains the text entered in the value. Use for searching text.
<b>NOTLIKE</b>	True if the text entered in the value is not contained within the attribute data. Use for searching text.

- Optional: For the Source Classification and Target Classification, enter the corresponding Value for the selected Condition.
- Optional: Add additional lines by using New Row and new groups by changing the Group number.
- Save your relationship rules.

## Collections

You can create collections of records such as configuration items, assets, and locations to make the records easier to access and manage in other applications. In the Collections application, you can create, view, change, or delete collections.

Instead of selecting from a list of all configuration items, assets, or locations, you specify the collection from which users obtain records.

You can also use collections to provide users limited access to configuration items. In the Security Groups application, you can assign user groups to specific collections. Users in these groups see only the configuration items that are part of the specified collections.

You also can make a collection active or inactive:

- If a collection is active, you can use the collection from other applications.
- If a collection is inactive, you can add, change, and delete collection details. However, you cannot use the collection in other applications.

When you create collections that are based on the appropriate details (for example, locations or departments), you can streamline software deployment, change request management, incident response, and other tasks.

For example, an information technology employee wants to update a software product on some of the computers in a customer service department. The department is in multiple locations. The employee accesses the customer service department collection, and selects computers from a list that is specific to that department.

- [Working with collections](#)

Collections are groupings of records, which makes the records easier to access and manage in other applications. You can create, change, and copy collections.

## Working with collections

Collections are groupings of records, which makes the records easier to access and manage in other applications. You can create, change, and copy collections.

- [Creating collections](#)

You create collections to contain configuration items, assets, and locations that you want to group together. By creating collections, the records in the collections are easier to access in other applications.

- [Changing collections](#)

As your business needs change, you can change your collections.

- [Copying collections](#)

You can copy collections to create similar records without entering the same information again. After you copy an existing collection, you change the new collection as needed.

---

## Creating collections

You create collections to contain configuration items, assets, and locations that you want to group together. By creating collections, the records in the collections are easier to access in other applications.

---

### About this task

You can add the same configuration item, asset, or location to multiple collections. You cannot add the same item, asset, or location multiple times to the same collection.

---

### Procedure

1. In the Collections application, click New Collection.
2. Provide a name for the collection.
3. Optional: Provide a description for the collection.
4. Optional: Activate or inactive the collection:
  - If a collection is active, you can use the collection in other applications.
  - If a collection is inactive, you can add, change, and delete collection details. However, you cannot use the collection in other applications.
5. Click New Row.
6. Optional: Specify values for configuration item, asset, or location.  
When you specify one of these values, the other two values become inactive.
7. Optional: Specify a value for site.  
The associations between sites, assets, and locations determine your ability to specify a value for site. Also, if you specify a site before you specify other values, your choices for asset or location are narrowed. Because configuration items do not belong to any sites, the Site field and Organization field are read-only when you add a configuration item.  
The Organization field displays the organization for the specified site.
8. Save your changes.

---

## Changing collections

As your business needs change, you can change your collections.

---

### Procedure

1. In the Collections application, select the collection that you want to change.
2. Optional: Activate or inactivate the collection:
  - If a collection is active, you can use the collection in other applications.
  - If a collection is inactive, you can add, change, and delete collection details. However, you cannot use the collection in other applications.
3. Optional: To change information in the Collection Details table window, delete the row and add a new row.  
The information in the Collection Details table window is read-only.
4. Optional: Change additional information.
5. Save your changes.

---

## Copying collections

You can copy collections to create similar records without entering the same information again. After you copy an existing collection, you change the new collection as needed.

---

### About this task

When you copy a collection, all of the information is copied from the existing collection, except for the value for collection.

---

### Procedure

1. Select the collection that you want to copy.
2. Select the Duplicate Collection action.
3. Provide a name for the new collection.
4. Optional: Provide a description for the new collection.
5. Optional: Change additional information.

---

## Planning module

You use the applications in the Planning module to plan how work should be performed, such as creating job plans that outline the steps that must be performed for each type of job.

- [Job Plans](#)  
You use the Job Plans application to manage job plan records. A job plan is a detailed description of work that is performed for a work order.
- [Resource Levels Management](#)  
In the Resource Levels Management application, you can create threshold levels that are used to calculate resources for dynamic job plans.
- [Routes](#)  
Routes simplify the creation of hierarchies of work orders for inspections. A route is a list of related assets, locations, or both. The assets and locations are considered stops along the route.
- [Safety](#)  
You use the applications in the Safety module (within the Planning module) to inform workers of potential dangers in their work environment and to provide information to protect workers from those dangers. The hazards, precautions, and procedures that you define in these applications can apply to assets, work locations, or both. You associate the records that you create in these applications with Asset, Location, PM (Preventive Maintenance), and Work Order records.
- [Documenting instrument specifications by using data sheets](#)  
You document your instrument specifications using the data sheet template. These specifications are typically defined by the manufacturer of the instrument.

---

## Job Plans

You use the Job Plans application to manage job plan records. A job plan is a detailed description of work that is performed for a work order.

Job plans generally contain tasks, and information regarding estimated labor, labor hours, materials, services, and tools that are required for the work. To ensure that work on an asset is performed safely, you can add work assets and associate safety plans that can be used when work is performed.

You can specify which organizations and sites can use the information that is on the job plan and its tasks. If you do not specify this information, the job plan can be used in any site of any organization.

You can apply job plans to preventive maintenance records, routes, and work orders. After a job plan becomes a work plan on a work order, you can change the work plan without affecting the job plan.

You also can create a job plan from a work plan that you use frequently.

- [Job plans overview](#)  
Job plans are detailed descriptions of work tasks (operations), labor, materials, and tools for a type of work. Job plans let you plan and standardize work tasks. You can use a job plan as a template for a work plan on a work order for repetitive maintenance work.
- [Working with job plans](#)  
Create and modify job plans that become work plans when they are associated with work orders and preventive maintenance records.

---

## Job plans overview

Job plans are detailed descriptions of work tasks (operations), labor, materials, and tools for a type of work. Job plans let you plan and standardize work tasks. You can use a job plan as a template for a work plan on a work order for repetitive maintenance work.

- [Organizations and sites on job plans](#)  
If your business has multiple facilities, you can set up multiple organizations and sites. Using different organizations and sites allows you to separate and share operations.
- [Dynamic job plans](#)  
In the Job Plans application, you can create job plans that dynamically calculate work resource requirements based on the scope of the work. This function is useful for businesses that manage continuous assets such as linear pipelines, roads, or tracks.
- [Job plan tasks](#)  
You can add tasks to job plans to accurately track costs. You can add estimates for labor, materials, services, and tools for the tasks. For each task, you can also create a nested job plan.
- [Job plan statuses](#)  
Each job plan has a status that indicates whether the job plan is not ready for use, in use, or inactive.
- [Job plan costs](#)  
You can view the costs for a job plan when it is used at the site that you specify. Since you can specify that certain components of a job plan are available only at certain sites, you can view costs at different sites where the job plan elements can be used.
- [Job plans and work orders](#)  
You can apply a job plan to a work order. Work orders refer to an activity, change, or release. The job plan that you apply becomes the work plan.
- [Direct issue items and services for job plans](#)  
Stocked or non-stocked items that are associated with a job plan can be direct issue items. Direct issue items are issued immediately upon receipt to an asset, location, or work order, rather than being stocked in a storeroom.
- [Safety plan precedence](#)  
You can associate safety plans with assets, locations, and items. You use safety plans to define safety requirements and procedures to fulfill regulatory

- requirements, and to inform employees of hazards that could occur while performing work, as well as actions to take to prevent accidents.
- [Meter information for job plans](#)  
You can use a meter name on a job plan task. The meter name is a generic name for a measurement point number.
- [Deletion rules for job plans](#)  
As your business needs change, you can delete a job plan.

## Organizations and sites on job plans

If your business has multiple facilities, you can set up multiple organizations and sites. Using different organizations and sites allows you to separate and share operations.

You can use multiple organizations and sites to create a job plan that you can use in different ways. For example, you create a job plan that is used on work orders anywhere in your business. On this job plan, you specify that certain tasks on the plan are available only on work orders for a certain organization or site. You can further specify labor, materials, services, and tools for certain tasks.

## Example of organizations and sites on job plans

When task 10 is used on a work order at site A, the task uses a certain craft. When task 10 is used on a work order at site B, the task uses a different craft.

## Dynamic job plans

In the Job Plans application, you can create job plans that dynamically calculate work resource requirements based on the scope of the work. This function is useful for businesses that manage continuous assets such as linear pipelines, roads, or tracks.

Job plans that are not dynamic apply resources, such as tools or materials, as a static package. For example, a job plan for changing the oil on a truck can specify 4 quarts of oil, which can be applied to each work order for oil changes on trucks.

Dynamic job plans can allocate labor, materials, tools, and services based on variable quantities and duration. For example, rail track maintenance is done in spans of varying length. Therefore, resource requirements for maintaining the rails can fluctuate based on the length of the repair. The amount of labor, tools, materials, and services varies, and the time to complete the work varies.

The key to creating a dynamic job plan is defining a unit of work or maintenance unit. For linear assets, the unit of work can be a distance, such as miles or kilometers. For non-linear assets, a unit of work is generally a quantity.

After you apply a dynamic job plan to a work order, you can specify the scope of the work that is needed to complete the job. Resources are then calculated based on the unit of work and calculation method that are specified in the job plan.

The following resources can be calculated:

- Quantity of
  - Labor
  - Tools
  - Materials
  - Services
- Duration of
  - Job plans
  - Tasks
  - Labor resource hours
  - Tool resource hours

Using the rail track example, you can create a job plan that defines a unit of work as 20 miles and specifies the method to use for calculating resources. When you apply the job plan to your work order and specify that the work covers 200 miles, resources are calculated for 10 units of work.

The following table explains how various calculation methods determine the resource quantity.

Table 1. Dynamic Job Plan Calculation Methods

Calculation method	Description	Calculation process
STATIC	Standard calculation	The resource quantity in the job plan is copied directly to the work order.
PROPORTIONAL	Calculation is proportional to the asset length. Use this method when the duration or resource requirements scale in direct proportion to the scope of the work.	The total work units on the work order is divided by the unit of work in the job plan. Then, that result is multiplied by the duration or resource quantity in the job plan.
LEVEL	Calculation is based on resource levels. Use this method when the requirements do not scale in direct proportion to the work.	The total work units on the work order is divided by the unit of work in the job plan. Then, the proper quantity is selected from a predefined level matrix for the resource.
ATTR LVL	Calculation is based on the asset specification attribute and on the resource level. Use this method when the requirements are based on the type of asset.	The asset specification attribute of the asset on the work order is checked. A by-level table is then used to choose the resource quantity.

Calculation method	Description	Calculation process
ATTR PROP	Calculation is based on the asset specification attribute and is proportional to the scope of the work. Use this method when the requirements are based on the type of asset.	The asset specification attribute or attributes on the work order are checked. Then a formula is used to calculate the resource quantity.

- [Configuring dynamic job plans](#)  
Before you can implement dynamic job plans, your administrator must configure a system property to enable dynamic job plans. Administrators must also give users permission to edit dynamic job plans for work orders.
- [Scenario: Creating a dynamic job plan for linear assets](#)  
Dynamic job plans are especially useful when you create work for linear assets, such as rail track maintenance, where the labor and materials that are needed for work vary based on the length of the track.
- [Scenario: Creating a dynamic job plan for non-linear assets](#)  
You can use dynamic job plans to calculate labor and materials for work on non-linear assets. For example, to determine how much labor is needed for a work order that inspects multiple assets, apply a dynamic job plan that calculates labor based on the number of assets to inspect.

## Configuring dynamic job plans

Before you can implement dynamic job plans, your administrator must configure a system property to enable dynamic job plans. Administrators must also give users permission to edit dynamic job plans for work orders.

### About this task

By default, the dynamicjobplan system property is not enabled. An administrator must enable the property before you can implement dynamic job plans. In addition, an administrator must update the edit rules for work orders in the Organizations application to ensure that users have permission to edit dynamic job plans.

### Procedure

1. To enable the dynamicjobplan system property, complete the following steps:
  - a. Go to System Configuration > Platform Configuration > System Properties.
  - b. Filter to locate the dynamicjobplan system property and expand the row for that property.
  - c. In the Global Value field in the Global Properties Details section, enter 1.
  - d. Save the record.
  - e. Select the check box for the dynamicjobplan property row.
  - f. From the Common Actions menu, click Live Refresh.
  - g. In the Live Refresh window, click OK.
2. To grant edit rights for dynamic job plans, complete the following steps:
  - a. Go to Administration > Organizations.
  - b. Select the organization that you want to give dynamic job plan access to.
  - c. From the More Actions menu, click Work Order Options > Edit Rules.
  - d. In the Edit Rules window, select the check box for the Dynamic Job Plan column and click OK.
  - e. Save the record.

### Results

When you complete the configuration steps, the Is dynamic field is available in the Job Plans application, and users can create dynamic job plans.

## Scenario: Creating a dynamic job plan for linear assets

Dynamic job plans are especially useful when you create work for linear assets, such as rail track maintenance, where the labor and materials that are needed for work vary based on the length of the track.

### Before you begin

The simulation test for this scenario requires a linear asset, such as a rail track or a pipeline. You can use an existing linear asset, or you can create one for the test. For more information, see the documentation for IBM® Maximo® Linear Asset Manager.

### About this task

The following scenario explains how to create a dynamic job plan that you can apply to work orders for track maintenance. The job plan uses a proportional calculation to determine the amount of labor and materials that are needed to repair sections of track. The proportional method calculates duration or resource requirements in direct proportion to the scope of the work. For this scenario, the unit of work for the calculation is 1 mile. When this job plan is applied to a work order, it calculates labor and materials for the work order based on the number of units of work that the work order requires. For example, if the work order specifies that 40 miles of track need to be repaired, the job plan calculates the amount of labor and materials that is needed to repair 40 miles of track.

### Procedure

1. In the Job Plans application, complete the following steps to create a dynamic job plan:
  - a. Create a new job plan.
  - b. Select Is dynamic.
  - c. In the Dynamic Job Plan Information section, select MILES for the work unit and specify a multiplier of 1.
  - d. Select PROPORTIONAL for the calculation method.
2. In the Job Plan Tasks section of the job plan, enter a repair task.
3. On the Labor subtab, click New Row and complete the following fields:

Option	Description
Task	Select the repair task that you created.
Type	Select HOURS.
Calculation	Select PROPORTIONAL.
Hours	Enter the amount of time that is needed to complete the task for each work unit.

4. Enter a labor, craft, crew, or crew type for the labor record.
5. On the Materials subtab, click New Row and complete the following fields:

Option	Description
Task	Select the repair task that you created.
Item	Select the item that is required for the task.
Item Quantity	Select the number of items that are needed for each work unit.
Calculation	Select PROPORTIONAL.

6. Save the job plan.
7. To test the job plan, from the More Actions menu, select Simulate Dynamic Job Plan and complete the following steps.
  - a. In Asset field in the Dynamic Job Plan Simulation window, select a linear asset.
  - b. Enter a start and end measure, or accept the default start and end measure boundaries for the asset.
  - c. Click Simulate.
  - d. Check that the Total Work Units field displays the expected value.

## Results

If the simulation shows that the job plan can calculate the work accurately, you can activate the job plan and apply it to work orders.

## Scenario: Creating a dynamic job plan for non-linear assets

You can use dynamic job plans to calculate labor and materials for work on non-linear assets. For example, to determine how much labor is needed for a work order that inspects multiple assets, apply a dynamic job plan that calculates labor based on the number of assets to inspect.

### Before you begin

This scenario creates a dynamic job plan that calculates labor that is required to perform an inspection for a fire extinguisher. To run a simulation to check the accuracy of the job plan, you need two or more active fire extinguisher assets.

### About this task

The dynamic job plan in this scenario uses a proportional calculation to determine the amount of labor that is needed for the inspection. The proportional method calculates duration or resource requirements in direct proportion to the scope of the work. For this scenario, the unit of work is EACH, and the multiplier is 1 to indicate that an inspection includes one fire extinguisher.

When this job plan is applied to a work order, the labor for the work order is calculated based on the number of units of work that the work order specifies. For example, if the work order specifies that four fire extinguishers must be inspected, the job plan calculates labor that is needed to inspect four fire extinguishers.

## Procedure

1. In the Job Plans application, complete the following steps to create a dynamic job plan:
  - a. Create a job plan for inspecting a fire extinguisher.
  - b. Select Is dynamic.
  - c. In the Dynamic Job Plan Information section, select EACH for the work unit and specify a multiplier of 1.
  - d. Select PROPORTIONAL for the calculation method.
2. In the Job Plan Tasks section of the job plan, enter an inspection task.
3. On the Labor subtab, click New Row and complete the following fields:

Option	Description
Task	Select the inspection task that you created.
Type	Select HOURS.
Calculation	Select PROPORTIONAL.
Hours	Enter the amount of time that is needed to complete an inspection for a fire extinguisher.

4. Enter a labor, craft, crew, or crew type for the labor record.
5. Save the job plan.
6. To test the job plan, from the More Actions menu, select Simulate Dynamic Job Plan and complete the following steps:
  - a. In Asset field in the Dynamic Job Plan Simulation window, select a fire extinguisher asset.
  - b. Click New Row and select another fire extinguisher asset.
  - c. Click Simulate.

d. Check that the Total Work Units field displays the expected amount of time for inspecting the fire extinguishers.

## Results

If the simulation shows that the job plan can calculate the labor accurately, you can activate the job plan and apply it to work orders.

## Job plan tasks

You can add tasks to job plans to accurately track costs. You can add estimates for labor, materials, services, and tools for the tasks. For each task, you can also create a nested job plan.

## Example of job plan tasks

The following table describes tasks that are associated with a job plan to perform annual maintenance on an electric cart. By default, the task identifiers are in increments of 10 to provide you with the flexibility to add tasks within the existing sequence. The sequence is optional; on a work order, the tasks are sorted by sequence, then by task identifier.

Sequence	Task	Description
1	10	<ul style="list-style-type: none"><li>Check tires, lights, horn, mirrors, windshield wipers, steering, key switch, and forward/reverse switch</li></ul>
2	20	<ul style="list-style-type: none"><li>Check brakes, brake lights, and emergency brake</li></ul>
3	30	<ul style="list-style-type: none"><li>Check battery</li><li>Add water as needed</li><li>Check terminals and cables</li></ul>
4	40	<ul style="list-style-type: none"><li>Lubricate chain and check sprockets</li></ul>
5	50	<ul style="list-style-type: none"><li>Repack wheel bearings</li><li>Grease steering chassis, as needed</li></ul>
6	60	<ul style="list-style-type: none"><li>Operate vehicle for safety check</li></ul>

## Job plan statuses

Each job plan has a status that indicates whether the job plan is not ready for use, in use, or inactive.

A job plan can have one of the following statuses:

- Draft - The draft status is the default status for new job plans. A draft job plan is being developed or reviewed. Job plans with this status are not available in other applications. You must change the status to active to make job plans available to in other applications.
- Active - An active job plan is complete. Only active job plans are available for use on work orders, preventive maintenance records, and routes.
- Inactive - You change the status of a job plan to inactive so that the job plan cannot be used on any new work orders.

In the Job Plans application, you use the Change Status action to change the status of a job plan.

## Job plan costs

You can view the costs for a job plan when it is used at the site that you specify. Since you can specify that certain components of a job plan are available only at certain sites, you can view costs at different sites where the job plan elements can be used.

In the Job Plans application, you use the View Cost action to view job plan costs. The cost information that you can view includes the total labor hours required to complete the job plan, and the costs for labor, materials, services, and tools.

## Example of job plan costs

Job plan 113355 requires that labor A is used at site 1 and labor B is used at site 2. Labor A has an hourly rate of \$34.00 and works for one hour. Labor B has an hourly rate of \$20.00 and works for two hours. You view costs for this job plan. In the Site field, you select site 1 and see a labor cost of \$34.00. When you change to site B, you see a labor cost of \$40.00.

## Job plans and work orders

You can apply a job plan to a work order. Work orders refer to an activity, change, or release. The job plan that you apply becomes the work plan.

You can choose a job plan that is associated with the work assets that are identified on the work order. When you associate a job plan with a work order, any default safety plan for the selected work asset is copied to the work order.

You can also specify that nested job plans are processed in the background when job plans are applied to work order type records. Applying large nested job plans can take a significant amount of time to process, so you can continue working while the process occurs in the background. You apply this setting in the Organizations application, by selecting Work Order Options, Other Organization Options, Process Nested Job Plans in the Background.

## Example

Job plan #112233 does not have an organization or site defined at the plan level. The job plan does have an organization or an organization and site defined for certain tasks. Some labor records on the job plan are associated with an organization or organization and site. The following tables illustrate the job plan tasks and labor:

Table 1. Tasks on job plan #112233

Task identifier	Organization	Site
10		
15	B	
20		
30		
40	A	
50	A	1

Table 2. Labor on job plan #112233

Task identifier	Labor or craft identifier	Organization	Site
None	Wilson	B	
None	Winston	A	
10	Electrician2		
10	Smith	A	1
15	Ellis	B	
20	Liberi	B	2

Work order #01 has organization A and site 1 defined. When job plan #112233 is applied to this work order, the following tasks, labor, and craft entries are copied to the work order plan:

Table 3. Tasks, labor, and crafts copied to the work plan on WO 01

Job plan-level labor and craft	Organization and site of labor and craft	Task	Task-level labor and craft	Organization and site of labor and craft
Winston	A	10	<ul style="list-style-type: none"> <li>Electrician2</li> <li>Smith</li> </ul>	<ul style="list-style-type: none"> <li>Organization A</li> <li>Site 1</li> </ul>
		20		
		30		
		40		
		50		

Work order #02 has organization A and site 2 defined. When job plan #112233 is applied to this work order, the following tasks, labor, and craft entries are copied to the work order plan:

Table 4. Tasks, labor, and crafts copied to the work plan on WO 02

Job plan-level labor and craft	Organization and site of labor and craft	Task	Task-level labor and craft	Organization and site of labor and craft
Winston	A	10	<ul style="list-style-type: none"> <li>Electrician2</li> </ul>	
		20		
		30		
		40		

Work order #03 has organization B and site 1 defined. When job plan #112233 is applied to this work order, the following tasks, labor, and craft entries are copied to the work order plan:

Table 5. Tasks, labor, and crafts copied to the work plan on WO 03

Job plan-level labor and craft	Organization and site of labor and craft	Task	Task-level labor and craft	Organization and site of labor and craft
Wilson	B	10	<ul style="list-style-type: none"> <li>Electrician2</li> </ul>	
		15	<ul style="list-style-type: none"> <li>Ellis</li> </ul>	B
		20		
		30		

Work order #04 has organization B and site 2 defined. When job plan #112233 is applied to this work order, the following tasks, labor, and craft entries are copied to the work order plan:

Table 6. Tasks, labor, and crafts copied to the work plan on WO 04

Job plan-level labor and craft	Organization and site of labor and craft	Task	Task-level labor and craft	Organization and site of labor and craft
Wilson	B	10	<ul style="list-style-type: none"> <li>Electrician2</li> </ul>

- [Work order classes for job plans](#)

To manage job plans, you can associate a default work order class with a job plan. Work orders specify a particular task to be accomplished, and the labor, materials, services, and tools needed to complete the work. The work order classes include activity, change, release, and work order.

- [Job plan conditions](#)

You apply conditions to job plans to specify that work can begin only when certain conditions are satisfied.

- [Job plan owners](#)

The owner of a job plan is the party responsible for the service management of the work when the job plan is used on a work order, route, or preventive maintenance record. The owner can be a person or an owner group, and is not the party responsible for performing the work.

## Work order classes for job plans

To manage job plans, you can associate a default work order class with a job plan. Work orders specify a particular task to be accomplished, and the labor, materials, services, and tools needed to complete the work. The work order classes include activity, change, release, and work order.

When you use a job plan to create work order-based records, the default class of the job plan defines the class of the work order-based record. When you apply a nested job plan to the work order and the class of the parent is associated with the job plan, the child work order has the same class as the parent. If the class of the parent is not associated with the job plan, the default class of the job plan for the child is used. When you do not associate a work order class with a job plan, you can use the job plan for all classes.

## Example of nested job plan

You have job plan 1 and job plan 2, which is nested to job plan 1. You associate nested job plan 2 with change and release work order classes, and change is the default class. When you apply job plan 1 to a release class record, the child that is created for the nested job plan has a release class because release is valid class for job plan 1.

## Job plan conditions

You apply conditions to job plans to specify that work can begin only when certain conditions are satisfied.

Job plan conditions automate the creation of new work items on a work order and improve the flow of work in your organization. Conditions can be applied to job plan components and to any corresponding resources. The job plan component can be a task, labor, materials, services, or tools.

You can require that conditions are met for the job plan component and also for the resources that are linked to it. When the conditions that you specify for job plans are met, the component of the job plan is copied to the designated work order.

The conditions that you create for job plans can be designed to suit the needs of your site or organization. You create conditions in the Conditional Expression Manager application.

## Example

A maintenance staff member identifies a leaking pump and creates a work order to fix the leak. The staff member specifies the details of the planned work order and applies a job plan. The job plan components have conditions that dictate how the work is to be carried out:

The correct type of seal must be used to fix the leak.

The condition specifies that the seal must be suitable for outdoor use. The job plan identifies two seals in planned material that have specific conditions about their suitability for outdoor or indoor use. The job plan condition requires that if the broken pump is located inside, seal A must be used. If the broken pump is located outside, seal B must be used.

The correct set of tools must be used.

The condition specifies that a specific set of tools must be used to perform the work task. The job plan identifies two sets of tools that can be used to repair pumps. The job plan condition dictates that if the broken pump is model number 123, tool set A must be used. If the pump is model number 456, tool set B must be used.

An additional safety check must be performed.

The condition specifies that an additional safety check task is performed when the job is complete. The job plan condition dictates that if the equipment is in circulation for more than two years, the pump requires an additional safety check.

The conditions are designed to create rules around the work that is performed. If any of the conditions are not met, the job plan component that the condition applies to is not copied to the work order. Only when the conditions are met for the job plan components, can the work be completed.

## Job plan conditions and process flow control

Job plan conditions that are not met can have an impact on process flow control. You must define predecessor relationships correctly to avoid a break in the process flow.

Predecessor relationships ensure that the sequential flow of a work order is not disrupted when job plan conditions are not met. If predecessor relationships are defined, but they control a task that is not copied to the work order, a break in the process flow can occur. If a condition is not met, the job plan task cannot be copied to the designated work order. As a result, any tasks that reference the job plan task as a predecessor are also affected.

## Example

A job plan scenario that does not have predecessor relationships correctly defined can cause a gap in the process flow.

In the following job plan scenario, the condition that is defined for task 30 might prove false. If the condition proves false, task 30 is not copied to the work order and task 40 no longer refers to task 30 as a predecessor. This outcome is not wanted for the job plan.

Job plan task	Predecessor task and relationship	Condition	Work order task	Predecessor task and relationship	Condition
10	Null value	Null value	10	Null value	Null value
20	10; Finish-to-start	Null value	20	10; Finish-to-start	Null value
30	20; Start-to-start	Condition is defined: Can be true or false.	Null value	Null value	Null value
40	30; Finish-to-start	Null value	40	Null value	Null value

Because the job plan condition that was defined for task 30 proved false, the sequence of tasks is broken. As a result, task 40 is lacking a predecessor relationship, so the status is set to In Progress (INPRG) at the same time as task 10.

A job plan scenario that has predecessor relationships correctly defined can bridge potential gaps in the process flow.

In the following job plan scenario, the condition that is defined for task 30 can still prove false. However, tasks 20 and 30 are defined as predecessors for task 40, so the potential gap in the process flow can be bridged.

Job plan task	Predecessor task and relationship	Condition	Work order task	Predecessor task and relationship	Condition
10	Null value	Null value	10	Null value	Null value
20	10; Finish-to-start	Null value	20	10; Finish-to-start	Null value
30	20; Start-to-start	Condition is defined: Can be true or false.	Null value	Null value	Null value
40	20; Start-to-start*; 30; Finish-to-start	Null value	40	20; Start-to-start	Null value

The condition that was defined for task 30 proved false, so the task and the predecessor value were not copied to the work order. However, by defining task 20 as an alternative predecessor to task 40, the sequential flow of the job plan scenario is uninterrupted.

## Related concepts

- [Predecessor relationships](#)

## Job plan owners

The owner of a job plan is the party responsible for the service management of the work when the job plan is used on a work order, route, or preventive maintenance record. The owner can be a person or an owner group, and is not the party responsible for performing the work.

If the Owner field and Owner Group field on a work order are blank when you apply a job plan to the work order, the owner information is copied to the work order. When you apply a job plan to a preventive maintenance record, the owner or owner group from the job plan overwrites the existing information about the preventive maintenance record.

## Direct issue items and services for job plans

Stocked or non-stocked items that are associated with a job plan can be direct issue items. Direct issue items are issued immediately upon receipt to an asset, location, or work order, rather than being stocked in a storeroom.

Services are always direct issue items.

When you add a service or classify an item as direct issue, the following events occur:

- For the item or service, the values in the Vendor field and Vendor Description field for the primary vendor are populated.
- The direct issue status of the item or service is copied to the work plan that is created from this job plan. When the work order is approved and a user selects the Reorder\_>Reorder Direct Issue Itms/Svcs action in the Inventory application, a purchase requisition is generated for this item or service. The item or service is issued without being received in inventory.

If you do not use the direct issue option for an item, that item is not automatically reordered, even when the reorder action is run.

## Safety plan precedence

You can associate safety plans with assets, locations, and items. You use safety plans to define safety requirements and procedures to fulfill regulatory requirements, and to inform employees of hazards that could occur while performing work, as well as actions to take to prevent accidents.

When you create a work plan from a job plan, only one safety plan is copied to the work order. The plan for a location or its associated rotating item takes precedence over the plan for the asset or its associated rotating item.

When you copy a safety plan to a work order, this job plan information is evaluated according to the following steps:

1. If the location for the work order has a default safety plan, use that plan. If the location for the work order does not have associated default safety plan, go to the next step.
2. If the rotating item associated with the location has a default safety plan, use that plan. If the rotating item associated with the location does not have a default safety plan, go to the next step.
3. If the asset for the work order has a default safety plan, use that plan. If the asset for the work order does not have a default safety plan, go to the next step.
4. If the rotating item associated with the asset has a default safety plan, use that plan. If the rotating item associated with the asset does not have a default safety plan, do not copy a safety plan to the generated work order.

When a safety plan is copied to a work order, the system copies all hazards, precautions, and hazardous materials.

---

## Meter information for job plans

You can use a meter name on a job plan task. The meter name is a generic name for a measurement point number.

When you use a job plan to build a work plan for an asset or location that is on a work order, the database searches for a three way match between the following items:

- The meter name on the asset or location
- The meter name on the job plan task that is used to build the work plan task
- The measurement point number for the meter name

If there is a match, the measurement point number is added to the work plan task. If there is matching meter information for the asset or location and the job plan used on a work order, the measurement point number is automatically added to a task of a work order record.

---

## Deletion rules for job plans

As your business needs change, you can delete a job plan.

You cannot delete a job plan if another active record, such as a work order or a preventive maintenance record, references the job plan. Before you delete the job plan, change the status of any record that references it to closed or history. To delete a job plan, use the Delete Job Plan action.

If you cannot delete a job plan, you can inactivate it. Inactivation maintains the job plan for reference, removes the job plan from all lookup and display lists, and makes the job plan unavailable for use on another record. To inactivate a job plan, change the job plan's status.

---

## Working with job plans

Create and modify job plans that become work plans when they are associated with work orders and preventive maintenance records.

- [Creating job plans](#)  
You use job plans to apply to preventive maintenance records, routes, and work orders to create work plans. A job plan is a detailed description of work that is performed for a work order. After you apply a job plan to a work order, you can customize the work plan or the work order without affecting the original job plan.
- [Classifying job plans](#)  
Classification provides you with a way to categorize your job plans. If you want to group job plans together, you can use classification.
- [Setting job plan conditions](#)  
To ensure that job plan components are copied to work orders under specific circumstances, you define conditions and then set them in the job plan. By setting conditions, you control when the tasks, labor, materials, services, or tools of a job plan are copied to work orders.
- [Revising job plans](#)  
You create job plans so that you can apply revision control to a job plan. When you revise job plans, a record of the changes that are made is saved.
- [Creating work orders when purchasing items on job plans](#)  
You can specify that a work order is created when any quantity of an item on a job plan is specified on an approved purchase order. Instead of being stocked in a storeroom, these items are issued directly upon receipt to an asset, location, or work order.
- [Setting up work process flows](#)  
Work process flows use relationships between work orders and tasks to automate the flow of status changes. You set relationships between work orders and tasks so that when a task is completed, the next task in the flow can be initiated.

---

## Creating job plans

You use job plans to apply to preventive maintenance records, routes, and work orders to create work plans. A job plan is a detailed description of work that is performed for a work order. After you apply a job plan to a work order, you can customize the work plan or the work order without affecting the original job plan.

## Procedure

---

1. In the Job Plans application, click New Job Plan and complete the fields.
2. On the Labor sub tab, Materials sub tab, Services sub tab, and Tools sub tab, create a new row and complete the fields.  
After you click New Row on these tabs, the Organization field and Site field become read-only.
3. On the Work Assets tab, create a new row to define the work assets to associate with safety plans.
4. Save the job plan.

- [Adding work order classes to job plans](#)

To further define job plans, you can add a work order class.

- [Adding tasks to job plans](#)

You can add tasks to a job plan. Tasks describe operational steps for a work order. The tasks can be applied when you create work orders for organizations or sites.

- [Adding nested job plans to tasks](#)

For each job task in a job plan, you can add a nested job plan to define the set of small job plans that are required to complete the task. Nested job plans are reusable components of large work projects that create work order hierarchies.

- [Predecessor relationships](#)

Predecessor relationships indicate when successor work records and tasks can begin to ensure that tasks are completed in a designated order.

- [Adding labor and crafts to job plans](#)

You can add labor and craft information to job plans. You add labor or a craft either at the job plan level or at various task levels. You can maintain multiple skill levels for a craft, multiple vendors and contracts for a skill level, and a pay rate for each combination.

- [Adding inventory items to job plans](#)

To manage your job plans, you can add inventory items.

- [Adding spare parts to job plans](#)

To manage your job plans, you can add spare parts.

- [Adding services to job plans](#)

You can add services to a job plan. Services are directly issued costs that are not labor, materials, or tools, such as telephone bills and travel costs.

- [Adding tools to job plans](#)

To manage job plans, you can add tools that are necessary to complete the job plan.

- [Adding work assets to job plans](#)

You can add work assets, such as locations and items, to a job plan. When you add work assets, you can associate safety plans when the asset is used on a work order. When you generate a work order from the job plan for the work asset, the safety plan or other associated plans are copied to the work order.

- [Associating safety plans with job plans](#)

You can associate safety plans with assets, locations, or items on a job plan. You use safety plans to help ensure that work is performed safely.

---

## Adding work order classes to job plans

To further define job plans, you can add a work order class.

### About this task

---

When you use a job plan to create work-order-based records, the default class of the job plan defines the class of the work order-based record. When you apply a nested job plan to the work order and the class of the parent is associated with the job plan, the child work order has the same class as the parent. If the class of the parent is not associated with the job plan, the default class of the job plan for the child is used.

## Procedure

---

1. In the Job Plans application, select the job plan to which you want to add a work order class.
2. In the Default WO Class field on the Job Plan tab, click Show/Manage Values.
3. In the Select Value window, click New Row to specify a work order class.
4. Optional: Set the work order class as the default for the job plan.  
You can set only one work order class as the default for the job plan. The first class that you add is set as the default class.
5. Click OK and save your changes.

---

## Adding tasks to job plans

You can add tasks to a job plan. Tasks describe operational steps for a work order. The tasks can be applied when you create work orders for organizations or sites.

### About this task

---

If the job plan has an organization or site at the job plan level, the tasks that you add inherit the organization or site information.

## Procedure

---

1. In the Job Plans application, select the job plan to which you want to add tasks.
2. In the Job Plan Tasks table window, click New Row.
3. Optional: Specify whether the task is being used at the organization or site level.  
The associated values are provided.

4. Specify or change the task identifier.  
To add tasks without disrupting the order, number the task identifiers in increments of 10.
5. Optional: Complete the following steps:
  - a. Provide a description of the task.
  - b. Specify the sequence in which the task is performed.
  - c. Specify a value for the nested job plan and meter.
  - d. Specify values for the owner, the owner group and classification.
6. Specify the estimated duration in hours that is needed to complete the task.
7. Save your changes.

---

## Adding nested job plans to tasks

For each job task in a job plan, you can add a nested job plan to define the set of small job plans that are required to complete the task. Nested job plans are reusable components of large work projects that create work order hierarchies.

### Procedure

---

1. In the Job Plans application, select the job plan.
2. In the Job Plan Tasks table window, select the task for which you want to add the nested job plan.
3. Specify a value for the nested job plan.
4. Save your changes.

---

## Predecessor relationships

Predecessor relationships indicate when successor work records and tasks can begin to ensure that tasks are completed in a designated order.

You can define the following relationships:

Relationship	Description
Finish-to-finish	When the status of a predecessor changes to COMP (Complete), its successor changes to INPRG (In Progress). You can change the status of the successor. However, you can only change the status of the successor to COMP if the status of the predecessor is COMP or beyond.
Finish-to-start	When the status of a predecessor changes to COMP (Complete), its successor changes to INPRG (In Progress). The status of the successor cannot be changed to INPRG until the status of the predecessor is COMP.
Start-to-finish	When the status of a predecessor status changes to INPRG (In Progress), the status of its successor changes to INPRG. You can change the status of the successor. However, you can only change the status of the successor to COMP (Complete), if the status of the predecessor is INPRG or beyond.
Start-to-start	When the status of a predecessor status changes to INPRG (In Progress), the status of its successor changes to INPRG. The status of the successor cannot be changed to INPRG until the status of the predecessor is INPRG.

Your work record statuses might be different, depending on the values that you defined in the Organizations application.

For example, Work Order 1 (WO1) has a Finish-to-start relationship with Work Order 2 (WO2). WO1 contains three tasks, the duration of which total 12 hours. WO2 cannot start until all tasks for WO1 are complete (12 hours). The status of WO2 changes to INPRG when all three tasks for WO1 are complete, making WO1 complete.

Lead and Lag time do not affect status changes that occur through flow control.

---

## Adding labor and crafts to job plans

You can add labor and craft information to job plans. You add labor or a craft either at the job plan level or at various task levels. You can maintain multiple skill levels for a craft, multiple vendors and contracts for a skill level, and a pay rate for each combination.

### Before you begin

---

You cannot add both a labor and a craft to a single-line item.

### About this task

---

If the job plan has an organization or site at the job plan level, the labor and crafts that you add inherit the organization or site information.

### Procedure

---

1. In the Job Plans application, select the job plan to which you want to add labor or crafts.
2. On the Labor sub tab of the Job Plan tab, click New Row.
3. Optional: Specify whether the labor or craft is being used at the organization or site level.  
The associated values are provided.
4. Optional: To associate the labor or craft with a job plan task, specify a value for the task.

5. To specify whether you are adding labor or a craft, complete one of these steps.  
The associated values are provided.
6. Optional: Provide additional information.  
When you add, delete, or change quantities or hours, the costs associated with the labor or craft are updated.
7. Save your changes.

---

## Example

The craft of painter has two skill levels: apprentice and master. To add an apprentice painter to a job plan, you must specify the skill level before the hourly rate is copied to the job plan.

---

## Adding inventory items to job plans

To manage your job plans, you can add inventory items.

---

### About this task

If the job plan has an organization or site at the job plan level, the inventory items that you add inherit the organization or site information.

---

### Procedure

1. In the Job Plans application, select the job plan to which you want to add inventory items.
2. On the Materials subtab of the Job Plan tab, click New Row.
3. Optional: Specify whether the inventory item is being used at the organization or site level.  
The associated values are provided.
4. Optional: To associate the inventory item with a job plan task, specify a value for the task.
5. Specify a value for the item and the quantity of the item.
6. Optional: Complete the following steps:
  - a. Specify a value for the storeroom.
  - b. If the inventory item must be acquired from another site, specify a value in the Site field.
  - c. Indicate whether the inventory items are direct issue items.  
The inventory item's primary vendor is listed. Inventory items that are not direct issue are not automatically reordered.
7. Save your changes.

---

## Adding spare parts to job plans

To manage your job plans, you can add spare parts.

---

### About this task

If the job plan has an organization or site at the job plan level, the spare parts that you add inherit the organization or site information.

---

### Procedure

1. In the Job Plans application, select the job plan to which you want to add spare parts.
2. On the Materials sub tab of the Job Plan tab, click New Row.
3. Optional: To associate the inventory item with a job plan task, specify a value for the task.
4. Click Spare Parts to open the Select Asset Spare Parts window.
5. In the Enter asset to search for spare parts field, specify the asset to which you want to add spare parts.
6. Click Refine to select the spare parts.
7. Click OK.
8. Optional: Complete the following steps:
  - a. Specify a value for the storeroom.
  - b. If the inventory item must be acquired from another site, specify a value in the Storeroom Site field.
  - c. Indicate whether the inventory items are direct issue items.  
The spare part's primary vendor is listed.
9. Save your changes.

---

## Adding services to job plans

You can add services to a job plan. Services are directly issued costs that are not labor, materials, or tools, such as telephone bills and travel costs.

---

### About this task

If the job plan has an organization or site at the job plan level, the services that you add inherit the organization or site information.

## Procedure

---

1. In the Job Plans application, select the job plan to which you want to add services.
2. On the Services sub tab of the Job Plan tab, click New Row.
3. Optional: Specify whether the services are being used at the organization or site level.  
The associated values are provided.
4. Optional: To specify whether this service is used that this service is used on a task, provide a value for the task.  
If you do not provide a task value, the service can be used on the job plan.
5. Specify values for the item set, service item, and quantity.  
If you add a service item that has a default vendor, the vendor and the unit cost for the service are provided. If you change the value for quantity, the line cost and unit cost are recalculated.
6. Save your changes.

---

## Adding tools to job plans

To manage job plans, you can add tools that are necessary to complete the job plan.

### About this task

---

If the job plan has an organization or site at the job plan level, the tools that you add inherit the organization or site information.

## Procedure

---

1. In the Job Plans application, select the job plan to which you want to add tools.
2. On the Tools sub tab of the Job Plan tab, click New Row.
3. Optional: Specify whether the tool is being used at the organization or site level.  
The associated values are provided.
4. Specify a value for the tool.
5. Optional: To use this tool on a task, specify a value for the task.  
If the task's value is in hours, that value is listed in the Tool Hours field.
6. Specify values for tool quantity, tool hours, and rate.  
The value for line cost is calculated.
7. Optional: To create a reservation for the tool, select the Reservation Required check box. You do not need to specify a storeroom for the reservation.
8. Save your changes.

---

## Adding work assets to job plans

You can add work assets, such as locations and items, to a job plan. When you add work assets, you can associate safety plans when the asset is used on a work order. When you generate a work order from the job plan for the work asset, the safety plan or other associated plans are copied to the work order.

### About this task

---

If the job plan has an organization or site at the job plan level, every asset that you add inherits the organization or site information.

## Procedure

---

1. In the Job Plans application, select the job plan to which you want to add assets.
2. On the Work Assets tab, click New Row.
3. Specify values for location, asset, and item.
4. Save your changes.

---

## Associating safety plans with job plans

You can associate safety plans with assets, locations, or items on a job plan. You use safety plans to help ensure that work is performed safely.

### About this task

---

When you generate a work order from the job plan for the work asset, the default safety plan or other associated plans are copied to the work order. After the work order is generated, you can replace or change the safety plan information on the work order without affecting the original safety plan.

## Procedure

---

1. In the Job Plans application, select the job plan that contains the work asset with which you want associate a safety plan.
2. On the Work Assets tab, select the row that contains the work asset.

3. To specify a safety plan, complete one of the following steps:
  - a. In the Safety Plan field, specify a safety plan.
  - b. Click New Row and provide the information for the safety plan.
4. Optional: Specify whether you want this plan to be the default safety plan for this work asset.  
You can have only one default safety plan for a work asset.

---

## Classifying job plans

Classification provides you with a way to categorize your job plans. If you want to group job plans together, you can use classification.

### About this task

---

You can classify and change the classification of a job plan until the job plan is closed. To remove a classification, in the Classification field, click Detail Menu > Clear Classification.

### Procedure

---

1. In the Job Plans application, select the job plan that you want to classify.
  2. In the Classification field, select Classify.
  3. In the Classify window, select a classification.  
The classification path, from the top level to the node that you selected, is listed in the Classification field.
  4. Save your changes.
- [Adding attributes to job plans](#)  
To further define a job plan, you can add attributes. You use attributes to categorize job plans, which helps to manage job plans.
  - [Adding attributes to tasks on job plans](#)  
To further define a task on a job plan, you can add attributes. You use attributes to categorize tasks on job plans, which helps to find and manage job plans.
  - [Changing attributes associated with job plans](#)  
To further define a job plan, you can change attributes that are associated with job plans. You use attributes to manage and categorize job plans.
  - [Changing attributes associated with tasks on job plans](#)  
To further define a task on a job plan, you can change attributes that are associated with job plans. You use attributes to manage and categorize job plans.

---

## Adding attributes to job plans

To further define a job plan, you can add attributes. You use attributes to categorize job plans, which helps to manage job plans.

### About this task

---

Before you can add attributes, there must be a classification associated with the job plan or job plan task.

### Procedure

---

1. In the Job Plans application, select the job plan to which you want to add attributes.
2. In the Classification field on the Specifications tab, specify a classification path.  
The attributes associated with that classification are displayed in the Specifications table window.
3. In the Specifications table window, click New Row.
4. Specify an attribute.
5. Provide additional specification information.
6. Save your changes.

### Example

---

A job plan involves the classification of a laptop to which you add the attributes of memory, speed, disk space, and operating system.

---

## Adding attributes to tasks on job plans

To further define a task on a job plan, you can add attributes. You use attributes to categorize tasks on job plans, which helps to find and manage job plans.

### About this task

---

Before you can add attributes, there must be a classification associated with the job plan or job plan task.

### Procedure

---

1. In the Job Plans application, select the job plan that has the task to which you want to add attributes.
2. In the Classification field on the Job Plan tab, specify a classification path.
3. In the Task Specifications table window on the Specifications tab, click New Row.
4. Specify an attribute.
5. Provide additional information for task specifications.
6. Save your changes.

---

## Example

A task on a job plan involves the classification of a notebook to which you add the attributes of memory, speed, disk space, and operating system.

---

## Changing attributes associated with job plans

To further define a job plan, you can change attributes that are associated with job plans. You use attributes to manage and categorize job plans.

---

### Procedure

1. In the Job Plans application, select the job plan with attributes that you want to change.
  2. Optional: In the Classification field on the Specifications tab, change the classification path.  
The attributes associated with that classification are displayed in the Specifications table window.
  3. Optional: In the Specifications table window, change the values in the attribute row.
  4. Save your changes.
- 

## Changing attributes associated with tasks on job plans

To further define a task on a job plan, you can change attributes that are associated with job plans. You use attributes to manage and categorize job plans.

---

### Procedure

1. In the Job Plans application, select the job plan that has the task with the attributes that you want to change.
  2. Optional: In the Classification field on the Job Plan tab, change the classification path.  
The attributes associated with that classification are displayed in the Specifications table window.
  3. Optional: In the Task Specifications table window, change the values in the attribute row.
  4. Save your changes.
- 

## Setting job plan conditions

To ensure that job plan components are copied to work orders under specific circumstances, you define conditions and then set them in the job plan. By setting conditions, you control when the tasks, labor, materials, services, or tools of a job plan are copied to work orders.

---

### Procedure

1. Activate the Set a Condition field, so that it is available in the Job Plans application.
  2. In the Organizations application, select the System Settings > Enable Job Plan Conditions action.
  3. In the Conditional Expression Manager application, create conditions for job plans.
  4. In the Job Plans application, select the job plan component that you want to set a condition for.
  5. In the Set a Condition field, select the condition that you want to set for the job plan component and save the record.
- 

## Revising job plans

You create job plans so that you can apply revision control to a job plan. When you revise job plans, a record of the changes that are made is saved.

---

### About this task

You can revise job plans that are in active status only. When you revise a job plan, the current job plan is duplicated with the same name. The revision number increments by 1. Work orders with an existing job plan attached are not updated with the revised version.

You can enable revision control in the Organizations application.

---

### Procedure

1. In the Job Plans application, select the job plan that you want to revise.

2. Select the Revise Job Plan action.
3. Enter a description for the revised job plan in the Revision Description field and click OK.  
The revised job plan has a status of pending revision. The original job plan remains in active status.
4. Update the revised job plan.
5. After all changes are completed, change the revised job plan to active status.  
The original job plan automatically changes to revised status and it can no longer be changed.
6. Save the revised job plan.

---

## Creating work orders when purchasing items on job plans

You can specify that a work order is created when any quantity of an item on a job plan is specified on an approved purchase order. Instead of being stocked in a storeroom, these items are issued directly upon receipt to an asset, location, or work order.

---

### Procedure

1. In the Job Plans application, select the job plan for which you want to create a work order when purchasing an item.
2. On the Work Assets tab, specify a value for the item.
3. Select the Create WO When Purchasing This Item check box.
4. Specify the work type for the work order that will be created.
5. Save your changes.

---

## Setting up work process flows

Work process flows use relationships between work orders and tasks to automate the flow of status changes. You set relationships between work orders and tasks so that when a task is completed, the next task in the flow can be initiated.

---

### Before you begin

To set the process flow for individual tasks, you must select Under Flow Control at the header level for the work order.

---

### About this task

The best practice for consistently using the flow feature is to set up the process flow as a work template at the job plan level.

---

### Procedure

1. Open the work order.
  2. Select Under Flow Control.
  3. On the Plans tab, display the details for the task.
  4. In the Scheduling Information section, next to the Predecessors field, click the Detail Menu icon.
  5. Select the tasks that must be completed before this task is initiated.
  6. Save the work order.
- [Defining flow actions](#)  
A flow action is used in a work process flow to define certain actions that should occur while work is being done. Actions or action groups can be applied to any work order, task, or job plan task.
  - [Removing work process flow from work orders or job plans](#)  
You can remove work process flow for a work order, a job plan, or task records that have it defined. You can do this at the header level, which will remove it for all the associated tasks as well, or you can remove it at the task level.
  - [Suspending work process flows](#)  
You can suspend the work process flow for work order or task records that have it defined. For example, if you want to start a work order or task manually, you could suspend the flow control on that record. The flow remains suspended until you remove the suspension.
  - [Stopping workflow processes](#)  
You can stop a workflow process for a record. You use the Workflow Administration application to view and stop workflow processes.

---

## Defining flow actions

A flow action is used in a work process flow to define certain actions that should occur while work is being done. Actions or action groups can be applied to any work order, task, or job plan task.

---

### About this task

You can determine whether the action takes place automatically, or if the action only takes place when it is initiated manually. When automatic, the action takes place as soon as the work order or task status is changed to an in progress (INPRG) status value by work process flow. When manual, you must initiate the flow

action by running the automation or processing scripts or placing an action button on the target application. Actions and action groups are defined in the Actions application.

## Procedure

1. In an application that supports flow action, display the record for which you want to define a flow action.
2. Perform one of the following actions:
  - For a work order, change, release, or job plan record, enter a value in the Flow Action field on the application tab.
  - For a work order or job plan task, enter a value in the Flow Action field in the Task table window. The Tasks table window is found on the main tab of the Job Plans application, or the Plans tab of the Work Order Tracking, Changes, and Releases applications.

The defined action runs when the work order or task status value is changed to INPRG.

3. Specify whether you want the flow action to be automatically run:

Option	Flow Action Assist
Automatically run the flow action	Cleared
Manually run the flow action	Selected

4. Click Save record.

## Removing work process flow from work orders or job plans

You can remove work process flow for a work order, a job plan, or task records that have it defined. You can do this at the header level, which will remove it for all the associated tasks as well, or you can remove it at the task level.

### About this task

If work process flow is removed at the header level, it will automatically be removed on individual tasks on the record. You cannot retain work process flow for a task that does not have it set at the header level.

## Procedure

1. In an application that supports flow action, display the record that you want to remove from work process flow.
2. On the main application tab, clear the Flow Controlled check box. The system removes the work order or the job plan, and all of its tasks from work process flow.
3. Click Save Record.

## Suspending work process flows

You can suspend the work process flow for work order or task records that have it defined. For example, if you want to start a work order or task manually, you could suspend the flow control on that record. The flow remains suspended until you remove the suspension.

### Before you begin

Removing the suspension restarts the flow. Any successor work orders or tasks with completed predecessors continue the process. Work orders and tasks without predecessors continue the process at the same time as the parent record. The last completed child under a parent rolls its completion up to the parent.

## Procedure

1. In an application that supports flow action, display the record on which you want to suspend flow control.
2. On the main application tab, at the header level, select the Suspend Flow Control check box. The system suspends the work process flow on the work order and on all of its tasks.
3. To retain flow control for individual tasks, display the tasks in the Tasks table window, and clear the Suspend Flow Control check box at the task level. Flow control remains in place at the task level. This action does not affect the suspension at the work order header level. You can find the Tasks table window on the Plans tab.
4. Click Save Record.

### Example

You generally suspend a set of tasks, often under the same parent. For example, you can delay the automatic starting of one whole phase of work until a certain condition has been met. You can also delay starting a phase of work to make changes to the tasks, such as inserting tasks, deleting tasks, and changing the precedence logic.

## Resource Levels Management

In the Resource Levels Management application, you can create threshold levels that are used to calculate resources for dynamic job plans.

The thresholds specify a starting point, end point, and a value to use when resources are calculated for anything within that range. For example, maintenance on a rail track less than 6 miles long requires one flagman. Any work over 6 miles requires two flagmen, and work over 20 miles requires three flagmen. Thus, the number of flagmen that are needed is calculated based on a distance threshold. For a starting point of 1 mile and an end point of 6 miles, specify 1 for the number of flagmen that are required. For a starting point of 6 miles and an end point of 20 miles, specify 2 for the number of flagmen. For anything over 20 miles, specify 3 flagmen.

The following table describes the parameters that you can set for calculating threshold levels.

Table 1. Resource Level Field Parameters

Field	Description
Level	User-defined identifier for the resource level.
Description	Description of the resource level.
Type	The type of object that you want to calculate: hours, quantity, or both.
Source	Text field that can be used to identify the regulatory or business source for the resource level.
Quantity Units	Unit of measure for the threshold, such as inches, hours, or miles.
Thresholds	<p>Start - The beginning of the threshold. The start threshold is the lowest number at which the value for this threshold range is selected.</p> <p>End - The end of the threshold. The end threshold is the number at which the value for this threshold range is no longer selected. If you do not specify an end threshold, resources are calculated for any value that is greater than the start threshold.</p> <p>Value - Quantity of items or number of hours to use if the number of work units is between the start and end for this threshold range.</p>

## Routes

Routes simplify the creation of hierarchies of work orders for inspections. A route is a list of related assets, locations, or both. The assets and locations are considered stops along the route.

You use the Routes application to create, view, modify, and delete route records. You can use a route in the following ways:

- Apply the route to a work order and generate child work orders for each route stop.
- Apply the route to a work order and generate a single work order that contains a list of assets and locations for all the route stops.
- Apply the route to a work order and generate task work orders for each route stop.
- Apply the route to a preventive maintenance (PM) record, and then generate a work order for the PM.
- [Routes overview](#)  
A route is a list of related assets, locations, or both. Route options are involved in work order generation and also linear assets.
- [Working with routes](#)  
You can create routes, view the routes assigned to assets and locations, associate linear assets with routes, and run reports on routes.

## Routes overview

A route is a list of related assets, locations, or both. Route options are involved in work order generation and also linear assets.

- [Route options and work order generation](#)  
When you define a route, the route option that you specify determines the type, number, and content of work orders that are generated. Work orders are generated when you apply the route to a work order or when you associate the route with a preventive maintenance (PM) record and then generate a work order from the PM.
- [Route options and work order descriptions](#)  
When you define routes, you specify a route option. This option affects the description that appears on generated work orders, as well as the number, type, and content of those work orders.

## Route options and work order generation

When you define a route, the route option that you specify determines the type, number, and content of work orders that are generated. Work orders are generated when you apply the route to a work order or when you associate the route with a preventive maintenance (PM) record and then generate a work order from the PM.

The following table describes the effect of the route options on the generation of work orders.

Option	Generated information
Child Work Orders	<ul style="list-style-type: none"> <li>• A child work order is generated for each route stop.</li> <li>• Any job plan information is copied to the child work order.</li> <li>• If a default safety plan is associated with the job plan, the safety information is copied to the child work order.</li> </ul> <p>Restriction: Assets and locations on all route stops must belong to the site associated with the route.</p>

Option	Generated information
Entries in the Work Order's Multi Asset, Location, and CI Table	<ul style="list-style-type: none"> <li>A single work order is generated. It contains a list of the assets and locations for all the route stops.</li> <li>Entries are created in the Multiple Assets, Locations and CIs (Configuration Items) table window in the Work Order Tracking application.</li> </ul> <p>Restriction:</p> <p>Job plans cannot be associated with route stops.</p>
Work Order tasks	<p>A task work order is generated for each route stop.</p> <p>Restriction:</p> <ul style="list-style-type: none"> <li>Assets and locations on all route stops must belong to the site associated with the route.</li> <li>Job plans cannot be associated with route stops.</li> </ul>

You associate a route with a preventive maintenance (PM) record by adding the route identifier to the PM, in the PM application. When you generate a work order from the PM, a parent work order is created for the asset, location, or general ledger account on the PM. The system also generates child work orders or task work orders for each route stop, or a single work order that lists the assets and locations for all the route stops, as if you applied the route directly to a work order. You can apply a route only at the bottom level of a PM hierarchy.

## Route options and work order descriptions

When you define routes, you specify a route option. This option affects the description that appears on generated work orders, as well as the number, type, and content of those work orders.

When you specify the Child Work Orders option or the Work Order Tasks option, the system uses the following logic to assign a description to the generated work orders:

1. If the route stop has a description, the route description becomes the work order description.
2. If the route stop has no description and it refers to an asset, the work order description is a concatenation of the asset identifier and the asset description. If necessary, the concatenated description is truncated to accommodate the size of the description field.
3. If the route stop has no description and it does not refer to an asset, the work order description is a concatenation of the location identifier and location description. If necessary, the concatenated description is truncated to accommodate the size of the description field.

When you specify the Entries in the Work Order's Multi Asset, Location, and CI Table option, no description is generated.

## Working with routes

You can create routes, view the routes assigned to assets and locations, associate linear assets with routes, and run reports on routes.

- [Creating routes](#)  
You can create a route to list all assets of the same type, all assets in a certain location, or both. For example, an inspection route might list all fire extinguishers in a plant, or all safety equipment in a building.
- [Viewing routes assigned to assets and locations](#)  
You can view the routes associated with an asset or location.
- [Running, scheduling, and printing reports within an application](#)  
When you are in an application and you need report information, there are several report actions from which you can choose to get that information. For example, you can run a report and then view its table of contents, print the report, and export the report data. You can open and view a report in a browser. You can directly print out a report, with or without attachments. You can schedule a report and send it using e-mail, and you can view and edit scheduled reports.

## Creating routes

You can create a route to list all assets of the same type, all assets in a certain location, or both. For example, an inspection route might list all fire extinguishers in a plant, or all safety equipment in a building.

## Procedure

1. In the Routes application, click New Route.
2. If the Route field is empty, specify a value.
3. Select a route option to specify the type of work orders to be generated when the route is applied to a work order:

Option	Description
<b>Child Work Orders</b>	A child work order is generated for each route stop.
<b>Entries in the Work Order's Multi Asset, Location, and CI Table</b>	A single work order is generated for all the assets and locations for all the route stops.
<b>Work Order Tasks</b>	A task work order is generated for each route stop.

4. If you select the Child Work Orders option or the Work Order Tasks option, you can select the Route Stops Inherit Status Changes check box to simultaneously update the status of all child work orders or task work orders. Otherwise, clear that check box.
5. Create one or more route stops:
  - a. Click New Row.

- b. In the Location field or the Asset field, specify a value.

If you select the Child Work Orders option or the Work Order Tasks option, the assets and locations on all route stops must belong to the site associated with the route. To select locations or assets from a list, perform one of the following actions:

To select:	Click:
Assets	Select Assets
Locations	Select Locations
Assets from a list of user-defined relationships when creating routes that involve linear assets	Path Selector

6. If you selected the Child Work Orders option, you can specify a value in the Job Plan field.
7. If the IBM® Maximo® Linear Asset Manager license is installed and you specified a linear asset in the Asset field, additional fields appear. Complete the fields in the Details section and the Linear Segment Details section as needed.
8. Click Save Route.

## Viewing routes assigned to assets and locations

You can view the routes associated with an asset or location.

### Procedure

1. In the Assets application or the Locations application, display the record whose routes you want to view.
2. Select the View > View Work Details action.
3. In the View Work Details window, click the Routes tab.

## Running, scheduling, and printing reports within an application

When you are in an application and you need report information, there are several report actions from which you can choose to get that information. For example, you can run a report and then view its table of contents, print the report, and export the report data. You can open and view a report in a browser. You can directly print out a report, with or without attachments. You can schedule a report and send it using e-mail, and you can view and edit scheduled reports.

### About this task

Attached document files with the following file extensions cannot be printed:

- .ppt
- .pptx

### Procedure

Complete a report-action task in the following table to select, view, print, or export report information, as needed.

Option	Description
<b>Run a report and optionally print it, export report data, and toggle the table of contents view</b>	<ol style="list-style-type: none"><li>a. Select the Reports Menu in the application toolbar and select an application, or select the Run Reports action, to open the Reports dialog box to the On Demand Reports tab.</li><li>b. In the Reports to Run table window, click the report that you want to run.</li><li>c. In the Request Page dialog box, specify any parameters to define the report, and then click Submit to run the report and open it in you browser.</li><li>d. From the Reporting toolbar, perform any of the following actions:<ul style="list-style-type: none"><li>• Click the Print Report as PDF icon to print the report. Due to spacing default settings, the page length of your report in .PDF print format can exceed the page length in your report browser.</li><li>• Click the Export Data icon to export the data in .CSV format.</li><li>• Click the Toggle table of contents icon to see the table of contents for the report that you selected.</li></ul></li></ol>
<b>Open a report in browser view</b>	<ol style="list-style-type: none"><li>a. Click the Browser View icon in the application toolbar to open the report in a report browser.</li><li>b. From Browser View, print the report or export the report data in .CSV format.</li></ol>
<b>Direct-print a report in .pdf form using the default printer of the browser</b>	<ol style="list-style-type: none"><li>a. Click the Direct Print icon on the application toolbar.</li></ol>
<b>Direct-print a report and all its attachments in .pdf form using the default printer of the browser</b>	<ol style="list-style-type: none"><li>a. Click the Direct Print with Attachments icon on the application toolbar to view the number of printable attachments that are attached to the report. Printable attachments have a supported file extension.</li><li>b. Click Yes to print all printable attachments.</li></ol>

Option	Description
<b>Schedule a report and send the report as PDF in e-mail</b>	<ol style="list-style-type: none"> <li>Click the Reports Menu in the application toolbar and select an application, or select the Run Reports action, to open the Reports dialog box.</li> <li>Click the Scheduling Status tab and select one of the following scheduling options: <ul style="list-style-type: none"> <li>Once - The report runs on a specific date and time in the future. Use this option to schedule complex or lengthy reports to run during off-peak hours. Specify a date in the format (M or MM) / (D or DD) / YY format. Specify a time in HH:MM format and specify a.m. or p.m.</li> <li>Recurring - The report runs at regular intervals. Four fields let you determine when the report runs. In the first field, enter a number from 1 through 365. In the second field, enter the interval (day, week, or month). In the third field, enter the day of the week or date of the month. In the fourth field, enter the time in HH:MM format, along with AM or PM. The following examples show the use of these fields: To run a report every day at 6:00 AM, select 1, and then Day. Leave the third field blank and then 6:00 AM. To run a report every other Friday at 5:00 PM, select 2, then Weeks, then Friday, and then 5:00 PM. To run a report every three months at 11:00 PM, on 15th of the month, select 3, then Months, then Day 15, and then 11:00 PM.</li> </ul> </li> <li>Specify one or more e-mail addresses of the recipients for the report. Enter any comments you want to include in the e-mail message.</li> <li>Specify a subject for the report, or use the report name which defaults to this field.</li> <li>Click Submit to run the report and send it to the e-mail address at the scheduled time.</li> </ol>
<b>View and edit scheduled reports</b>	<ol style="list-style-type: none"> <li>Click the Reports Menu in the application toolbar and select an application, or select the Run Reports action, to open the Reports dialog box.</li> <li>Click the Scheduling Status tab to open the Scheduling Status dialog box.</li> <li>In the Schedules You Can Edit section, you can view the type of report (once or recurring) and the next run time. You can delete a scheduled report and change schedule information.</li> </ol>

## Safety

You use the applications in the Safety module (within the Planning module) to inform workers of potential dangers in their work environment and to provide information to protect workers from those dangers. The hazards, precautions, and procedures that you define in these applications can apply to assets, work locations, or both. You associate the records that you create in these applications with Asset, Location, PM (Preventive Maintenance), and Work Order records.

- [Hazards](#)  
A hazard is any condition that exists in the workplace that might lead to worker injury, property damage, or financial loss. You use the Hazards application to define hazards, associate preventive measures (precautions) and hazardous materials with hazards, and view tag out procedures that are associated with hazards.
- [Precautions](#)  
A precaution is a preventive measure that you take to reduce or eliminate a workplace hazard; for example, wearing hearing protection when working in an area where you are exposed to loud noises. You use the Precautions application to define safety precautions.
- [Lock Out / Tag Out](#)  
Tag out procedures are intended to completely eliminate the risks associated with a hazard, and lock out operations must be performed exactly as specified. You use the Lock Out / Tag Out application to create tag out procedures.
- [Safety Plans](#)  
Safety plans provide all the safety related information about an asset or location in one record, which you can then copy to job plans and work orders. You must clearly associate safety requirements and procedures with work orders to fulfill the requirements of regulatory agencies. You use the Safety Plans application to create safety plans and to add and view associated work assets, hazards, precautions, and tag out procedures.

## Hazards

A hazard is any condition that exists in the workplace that might lead to worker injury, property damage, or financial loss. You use the Hazards application to define hazards, associate preventive measures (precautions) and hazardous materials with hazards, and view tag out procedures that are associated with hazards.

- [Working with hazards](#)  
Hazard records define potential dangers associated with assets. You can associate precautions and tag out procedures with hazard records.

## Working with hazards

Hazard records define potential dangers associated with assets. You can associate precautions and tag out procedures with hazard records.

- [Creating hazard records](#)  
Create a hazard record to ensure that employees working with work assets (assets and locations) are informed of potential dangers associated with those assets.
- [Associating precautions with hazards](#)  
You associate a precaution with a hazard to inform employees how to reduce the risks involved with the hazard.
- [Associating tag out procedures with hazards](#)  
Associate a tag out procedure with a hazard to ensure that workers take appropriate action when they encounter a safety plan that contains the hazard.

## Creating hazard records

Create a hazard record to ensure that employees working with work assets (assets and locations) are informed of potential dangers associated with those assets.

## Procedure

1. In the Hazards application, click New Hazard.
2. In the Hazard field, specify an identifier for the hazard.
3. Optional: In the Type field, specify the type of hazard.
4. Specify the type of information that you will associate with the hazard. If you associate a tag out procedure with the hazard, you cannot also associate a precaution or a hazardous material with the hazard.

Option	Description
<b>Precautions</b>	Select the Can Have Precautions check box.
<b>Hazardous materials</b>	Select the Can Have Hazardous Materials check box.
<b>Tag out procedures</b>	Select the Can Have Tag Outs check box.

5. If you selected the Can Have Hazardous Materials check box, complete the fields in the Hazardous Material Information section.
6. Click Save Hazard.

## What to do next

- In the Precautions application, you can create a precaution to associate with the hazard.
- In the Assets application or the Locations application, you can associate the hazard with an asset or a location.

## Associating precautions with hazards

You associate a precaution with a hazard to inform employees how to reduce the risks involved with the hazard.

## Before you begin

- In the Hazards application, create the hazard record and select the Can Have Precautions check box.
- In the Precautions application, create the precaution record.

## Procedure

1. In the Hazards application, display the hazard.
2. Associate one or more precautions with the hazard:
  - a. On the Precautions tab, click New Row.
  - b. In the Precaution field, specify a value.
3. Click Save Hazard.

## What to do next

- In the Assets application or the Locations application, you can associate the hazard and precaution with an asset or location.
- In the Safety Plans application, you can add the hazards and precaution to a safety plan.

## Associating tag out procedures with hazards

Associate a tag out procedure with a hazard to ensure that workers take appropriate action when they encounter a safety plan that contains the hazard.

## Before you begin

- In the Hazards application, create the hazard record and select the Can Have Tag Outs check box.
- In the Lock Out / Tag Out application, create the tagout procedure.

## About this task

You associate a tag out procedure with a hazard through the asset or location that the hazard applies to.

## Procedure

1. In the Assets application or the Locations application, display the work asset or location that you want to associate the hazard with.
2. On the Safety tab, select the Lock Out/Tag Out sub tab.
3. In the Hazards table window, click New Row.
4. In the Hazard field, specify the hazard.
5. In the Tag Out Procedures table window, click New Row.
6. In the Tag Out field, specify the tag out procedure.  
The lockout operations appear in the Lock Out Operations table window.

7. Depending on the application that you are using, click Save Asset or Save Location.

---

## What to do next

- In the Safety Plans application, you can associate the tag out procedure with a safety plan.
- In the Work Order Tracking application, you can associate the tag out procedure with a work order.

---

## Precautions

A precaution is a preventive measure that you take to reduce or eliminate a workplace hazard; for example, wearing hearing protection when working in an area where you are exposed to loud noises. You use the Precautions application to define safety precautions.

- [Creating precaution records](#)  
Create precaution records to help employees reduce the hazards involved with workplace tasks.

---

## Creating precaution records

Create precaution records to help employees reduce the hazards involved with workplace tasks.

---

### Procedure

1. In the Precautions application, click New Precaution.
2. In the Precaution field, specify an identifier for the precaution.
3. Click Save Precaution.

---

## What to do next

In the Hazards application, associate the precaution with a hazard.

---

## Lock Out / Tag Out

Tag out procedures are intended to completely eliminate the risks associated with a hazard, and lock out operations must be performed exactly as specified. You use the Lock Out / Tag Out application to create tag out procedures.

- [Working with tag out procedures and lock out operations](#)  
A tag out procedure describes how to take work assets out of service and place them back in service, to ensure a safe work environment. The tag out procedure is a series of steps, which are called lock out operations.

---

## Working with tag out procedures and lock out operations

A tag out procedure describes how to take work assets out of service and place them back in service, to ensure a safe work environment. The tag out procedure is a series of steps, which are called lock out operations.

- [Creating tag out procedures](#)  
Create a tag out procedure to eliminate a hazard and ensure a safe work environment. To create a tag out procedure, you describe the steps, or lock out operations, to remove a work asset from service and place it in a safe condition. Lock out operations can apply to an asset, a location, a locking device, or an activity that is not related to a particular device or asset.
- [Associating tag out procedures with work assets](#)  
Associate a tag out procedure with a work asset to enable employees to eliminate the hazards associated with that asset or location.

---

## Creating tag out procedures

Create a tag out procedure to eliminate a hazard and ensure a safe work environment. To create a tag out procedure, you describe the steps, or lock out operations, to remove a work asset from service and place it in a safe condition. Lock out operations can apply to an asset, a location, a locking device, or an activity that is not related to a particular device or asset.

---

### Procedure

1. In the Lock Out / Tag Out application click New Tag Out.
2. In the Tag Out field, specify an identifier for the tag out procedure.
3. In the Location field or the Asset field, specify the location or asset to which the tag out procedure applies.

4. In the Site field, specify the site to which the tag out procedure applies.
5. In the Required State field, specify the state that the location or asset must be in after the tag out procedure is applied.
6. Optional: To attach additional information to the tag out record, click Attachments.
7. Specify the lock out operations in the tag out procedure:
  - a. Click New Row.
  - b. If the lock out operation applies to a particular asset or a location, specify a value in the Location field or the Asset field.
  - c. If the lock out operation does not apply to a particular asset or location, describe the lock out activity in the Description field.
  - d. Optional: In the Locking Device Required State field, specify the state that the asset or location must be in after the lock out step is performed.
  - e. In the Apply Sequence field, specify the sequence number of this step when you tag out the asset.
  - f. In the Remove Sequence field, specify the sequence number of this step when you restore the asset to service.
8. Click Save Tag Out.

---

## What to do next

You can perform any of the following actions:

- In the Assets application or the Locations application, associate the tag out procedure with a hazard and an asset or location.
- In the Safety Plans application, associate the tag out procedure with a safety plan.
- In the Work Order Tracking application, add the tag out procedure to a work order.

---

## Associating tag out procedures with work assets

Associate a tag out procedure with a work asset to enable employees to eliminate the hazards associated with that asset or location.

---

## Before you begin

- In the Hazards application, create a hazard record and select the Can Have Tag Outs check box.
- In the Lock Out / Tag Out application, create a tag out procedure for the hazard.

---

## Procedure

1. In the Assets application or the Locations application, display the asset or location that you want to associate the hazard with.
2. On the Safety tab, select the Lock Out/Tag Out subtab.
3. Click New Row.
4. In the Hazard field, specify the hazard that you want to associate with the asset.
5. Click Save Asset or Save Location.
6. On the Lock Out/Tag Out subtab, select the hazard that you want to associate with the tag out procedure.
7. Below the Tag Out Procedures table window, click New Row.
8. In the Tag Out field, specify the identifier of the tag out procedure.
9. Depending on the application that you are in, click Save Asset or Save Location.

The lock out steps for the tag out procedure appear in the Lock Out Operations table window.

---

## What to do next

In the Safety Plans application, you can associate the tag out procedure with a safety plan.

---

## Safety Plans

Safety plans provide all the safety related information about an asset or location in one record, which you can then copy to job plans and work orders. You must clearly associate safety requirements and procedures with work orders to fulfill the requirements of regulatory agencies. You use the Safety Plans application to create safety plans and to add and view associated work assets, hazards, precautions, and tag out procedures.

When you use a safety plan on a work order, the information about hazards, precautions, and hazardous material is copied to the work order, even if no work assets are associated with the work order.

- [Safety plans overview](#)

A safety plan includes all the information needed to safely perform a specific type of work or job plan. To create a safety plan, you need to understand the relationship between its work assets and locations, related assets and locations, and all related hazards, hazardous materials, precautions, and tag out procedures.
- [Working with safety plans](#)

---

## Safety plans overview

A safety plan includes all the information needed to safely perform a specific type of work or job plan. To create a safety plan, you need to understand the relationship between its work assets and locations, related assets and locations, and all related hazards, hazardous materials, precautions, and tag out procedures.

Before you create a safety plan, consider the following:

1. Have a specific job in mind that requires a safety plan.
2. List the work assets and locations on which a job plan might use this safety plan. When you create a safety plan, the work asset combined with the type of work dictates the safety information that is required.
3. Understand how hazards relate to the work assets.
4. List all related assets and locations that might cause hazards or other safety problems when a job plan is used. You create this asset list on the Safety-Related Assets subtab, which is on the Safety tab in the Assets application and the Locations application.

---

## Working with safety plans

- [Creating safety plans](#)

Create safety plans to inform employees of hazards that they might encounter while performing work and the actions they must take to prevent accidents. You can create generic safety plans for use on all work assets or locations or for use on a particular work asset or location.

- [Adding hazardous materials to safety plans](#)

Add hazardous materials to a safety plan to inform workers of hazards associated with the work assets and related assets and locations on the safety plan.

- [Adding precautions to safety plans](#)

Add precautions to a safety plan to help employees reduce the hazards involved with workplace tasks.

- [Adding tag out procedures to safety plans](#)

Add tag out procedures to safety plans to eliminate the hazards associated with the assets or locations on the safety plan.

- [Associating related work assets and hazards with safety plans](#)

Select the hazards, assets, and locations that apply to a particular safety plan, and the system populates the safety plan with the related hazardous material, precaution, and tag out information.

---

## Creating safety plans

Create safety plans to inform employees of hazards that they might encounter while performing work and the actions they must take to prevent accidents. You can create generic safety plans for use on all work assets or locations or for use on a particular work asset or location.

---

### Procedure

1. In the Safety Plans application, click New Safety Plan.
2. In the Safety Plan field, specify an identifier for the safety plan.
3. Optional: Specify the work assets and locations that might use this safety plan on a work order or a job plan.
  - a. Click New Row.
  - b. In the Location field or the Asset field, specify a value.  
You can specify a location or an asset, but not both.
4. Perform one or both of the following actions to associate hazardous material, precaution, and tag out information with the safety plan.

Option	Description
<b>View and select related assets and hazards</b>	Select the Select Hazards action.
<b>Manually add related assets and hazards</b>	Use the tabs to add precautions, hazardous materials, and tag out procedures.

5. Click Save Safety Plan.

---

### What to do next

- In the Job Plans application, you can associate the safety plan with a job plan.
- In the Preventive Maintenance (PM) application, you can associate the safety plan with a PM record through a related job plan.
- In the Work Order Tracking application, you can associate the safety plan with a work order.

---

## Adding hazardous materials to safety plans

Add hazardous materials to a safety plan to inform workers of hazards associated with the work assets and related assets and locations on the safety plan.

---

### Before you begin

1. In the Hazards application, create the hazard, select the Can Have Hazardous Materials check box, and define the hazardous material.
2. In the Safety Plans application, create the safety plan.

---

### Procedure

1. In the Safety Plans application, display the safety plan that you want to update.
2. Associate one or more hazardous materials with the safety plan:
  - a. On the Hazardous Materials tab, click New Row.
  - b. In the Hazard field, specify a hazard.  
The NFPA ratings for the hazardous material are displayed.
  - c. Optional: In the Related Location field or the Related Asset field, specify a value.
3. Click Save Safety Plan.

## Results

---

If a precaution is associated with any hazard that you specified, the hazard also appears on the Hazards and Precautions tab.

---

## Adding precautions to safety plans

Add precautions to a safety plan to help employees reduce the hazards involved with workplace tasks.

### Before you begin

---

1. In the Precautions application, create the precaution record.
2. In the Hazards application, create the hazard record, select the Can Have Precautions check box, and associate the precaution with the hazard.
3. In the Safety Plans application, create the safety plan.

### Procedure

---

1. In the Safety Plans application, display the safety plan that you want to update.
2. Associate one or more hazards and precautions with the safety plan:
  - a. On the Hazards and Precautions tab, click New Row.
  - b. In the Hazard field, specify a hazard.  
The related precautions appear in the Precautions table window.
  - c. Optional: In the Related Location field or the Related Asset field, specify a related location or asset that can pose a hazard.
3. Click Save Safety Plan.

## Results

---

If any hazard that you specified is associated with a hazardous material, the hazard also appears on the Hazardous Materials tab.

---

## Adding tag out procedures to safety plans

Add tag out procedures to safety plans to eliminate the hazards associated with the assets or locations on the safety plan.

### Before you begin

---

1. In the Hazards application, create the hazard.
2. In the Lock Out / Tag Outs application, create the tag out procedure.
3. In the Assets application or the Locations application, associate the tag out procedure with a hazard through the related asset or location.
4. In the Safety Plans application, create the safety plan.

### About this task

---

To add a tag out procedure to a safety plan, you first associate the procedure with a hazard in the Assets application or the Locations application. After you add a hazard and its related asset or location to a safety plan, the related tag out procedure is automatically added to the safety plan.

### Procedure

---

1. In the Safety Plans application, display the safety plan that you want to update.
2. Associate one or more tag out procedures with the safety plan:
  - a. On the Tag Outs tab, in the Hazards table window, click New Row.
  - b. In the Hazard field, specify a hazard.  
Any tag out procedures for that hazard display in the Tag Outs table window.
  - c. In the Work Location field or the Work Asset field, specify the location or asset on which work will be performed.
  - d. Optional: In the Related Location field or the Related Asset field, specify a related location or asset that poses a hazard.
3. Click Save Safety Plan.

---

## Associating related work assets and hazards with safety plans

Select the hazards, assets, and locations that apply to a particular safety plan, and the system populates the safety plan with the related hazardous material, precaution, and tag out information.

### Before you begin

---

1. Define the hazards, hazardous materials, precautions, and tag out procedures that apply to the work asset and related assets and locations.

2. In the Assets and Locations application, associate the hazardous materials, precautions, and tag out procedures with assets that this safety plan will be used on.

---

## Procedure

1. In the Safety Plans application, display the safety plan that you want to update.
2. Select the Select Hazards action.  
The Select Hazards window displays the related assets and locations for the safety plan.
3. Select the hazards that you want to apply to the safety plan:
  - a. In the Work Assets table window, select the asset or location whose hazards you want to view.  
The hazards display in the Hazards table window.
  - b. In the Hazards table window, select the hazards that you want to add to the safety plan.
  - c. Click Apply.
4. Click OK.

---

## Results

The information that you selected appears on the various tabs in the Safety Plans application.

---

## What to do next

- In the Job Plans application, you can associate the safety plan with a job plan.
- In the Preventive Maintenance (PM) application, you can associate the safety plan with a PM record through a related job plan.
- In the Work Order Tracking application, you can associate the safety plan with a work order.

---

## Documenting instrument specifications by using data sheets

You document your instrument specifications using the data sheet template. These specifications are typically defined by the manufacturer of the instrument.

- **Data sheet templates**  
Data sheets are templates that define the calibration process for one or more asset functions. You use the Data Sheet Template application to create data sheets for calibration assets.
- **Data sheets**  
Data sheets provide technicians with the information that they need to perform a calibration. A data sheet is a template that defines the specifications of an asset for the calibration process.
- **Non-linear instruments in data sheets**  
Non-linear instruments are analog instruments that have their tolerance limits calculated based on the desired output value and not the nominal input value.
- **Tolerance limits on data sheets**  
Tolerance is an acceptable value or value range for a specified output value. You define the tolerance limits for accuracy of a calibration point on a data sheet.
- **Creating data sheets**  
A data sheet is a template that defines the specifications of an asset for the calibration process. Data sheets give a technician the information necessary to calibrate an analog or discrete asset function.
- **Associating work assets with data sheets**  
When you associate an asset with a data sheet, you are attaching a template with predefined calibration points for the work asset.
- **Duplicating the asset function of a data sheet**  
When you create multiple data sheets with similar information, you can duplicate the asset function information to save time.
- **Calibration calculations**  
During the calibration of an asset, calculations are used to determine whether the asset passes or fails the calibration. These calculations are based on the values that you specify on the data sheet.
- **Data sheet templates**  
Data sheets are templates that define the calibration process for one or more asset functions. You use the Data Sheet Template application to create data sheets for calibration assets.
- **Data sheets**  
Data sheets provide technicians with the information that they need to perform a calibration. A data sheet is a template that defines the specifications of an asset for the calibration process.
- **Non-linear instruments in data sheets**  
Non-linear instruments are analog instruments that have their tolerance limits calculated based on the desired output value and not the nominal input value.
- **Tolerance limits on data sheets**  
Tolerance is an acceptable value or value range for a specified output value. You define the tolerance limits for accuracy of a calibration point on a data sheet.
- **Creating data sheets**  
A data sheet is a template that defines the specifications of an asset for the calibration process. Data sheets give a technician the information necessary to calibrate an analog or discrete asset function.
- **Associating work assets with data sheets**  
When you associate an asset with a data sheet, you are attaching a template with predefined calibration points for the work asset.
- **Duplicating the asset function of a data sheet**  
When you create multiple data sheets with similar information, you can duplicate the asset function information to save time.
- **Calibration calculations**  
During the calibration of an asset, calculations are used to determine whether the asset passes or fails the calibration. These calculations are based on the values that you specify on the data sheet.

---

## Data sheets

Data sheets provide technicians with the information that they need to perform a calibration. A data sheet is a template that defines the specifications of an asset for the calibration process.

A data sheet defines the asset function specifications and the calibration point of an asset. The data sheet also defines the functional checks and dynamics checks of an asset, if required.

Data sheets are associated with assets and are copied to calibration work orders for the asset. On the work order data sheet, the technician enters calibration As Found and As Left data. This data is used to analyze asset performance and calibration frequency.

The data sheet also records uncertainty measurement data for instruments and measuring and test equipment (M&TE). This uncertainty data is calculated and imported from an external source into the Data Sheet Template application and the Work Order Tracking application.

- [Asset functions](#)  
The asset function specifies the calibration data for the function of an asset. You can specify calibration data about one or more asset functions.
- [Calibration points](#)  
A calibration point is the test information that is used to calibrate an asset. The amount of calibration points that are required for a calibration process is determined by business requirements.
- [Dynamic checks](#)  
A dynamic check is additional data about the instrument being calibrated.
- [Functional checks](#)  
A functional check is an additional check point that is required to calibrate an instrument.
- [Uncertainty measurement for calibration](#)  
The results from the calibration of an asset can vary when the asset is measured multiple times. In calibration, the uncertainty measurement helps determine the reliability of the asset by comparing the recorded value to its real value.
- [Asset functions](#)  
The asset function specifies the calibration data for the function of an asset. You can specify calibration data about one or more asset functions.
- [Calibration points](#)  
A calibration point is the test information that is used to calibrate an asset. The amount of calibration points that are required for a calibration process is determined by business requirements.
- [Dynamic checks](#)  
A dynamic check is additional data about the instrument being calibrated.
- [Functional checks](#)  
A functional check is an additional check point that is required to calibrate an instrument.
- [Uncertainty measurement for calibration](#)  
The results from the calibration of an asset can vary when the asset is measured multiple times. In calibration, the uncertainty measurement helps determine the reliability of the asset by comparing the recorded value to its real value.

---

## Asset functions

The asset function specifies the calibration data for the function of an asset. You can specify calibration data about one or more asset functions.

Calibration data includes the input and output values of an asset, the tolerance limits of an asset, and the uncertainty measurement data of an asset. The combination of these values is calculated to determine whether the calibration of an instrument passes or fails performance tests.

You can configure a data sheet for the following types of devices:

Analog device

An *analog device* is an instrument that provides continuous results, such as a pressure gauge.

Discrete device

A *discrete device* is an instrument that has only two settings. For example, a discrete device can be a switch that is either on or off or a valve that is either open or closed.

- [Asset function parameters](#)  
The asset function specifies the calibration data for an asset. There are two types of asset functions: an analog asset function and a discrete asset function.

## Calibration points

A calibration point is the test information that is used to calibrate an asset. The amount of calibration points that are required for a calibration process is determined by business requirements.

A calibration point defines the nominal input value and the desired output value for an analog asset function.

A calibration point defines the set point and set point action for a discrete asset function.

---

## Dynamic checks

A dynamic check is additional data about the instrument being calibrated.

A dynamic check point does not affect the calibration of an instrument, but is relevant to the calibration of an instrument. For example, a dynamic check can record the reading of gear settings or controller tuning of an instrument.

---

## Functional checks

A functional check is an additional check point that is required to calibrate an instrument.

The options for a functional check are either pass or fail. For example, a functional check can record a temperature setting that contributes to either a pass or fail.

---

## Uncertainty measurement for calibration

The results from the calibration of an asset can vary when the asset is measured multiple times. In calibration, the uncertainty measurement helps determine the reliability of the asset by comparing the recorded value to its real value.

Any measurement is subject to imperfections. Some of these imperfections are caused by random effects, such as short-term fluctuations in temperature, humidity, and air-pressure, or variability in the performance of the measurer. Repeated measurements show variation because of these random effects.

Other imperfections are caused by systematic effects. These systematic effects can be the offset of a measuring instrument or a change in its characteristics between calibrations. Other systematic effects can be personal bias in reading an analog scale or the uncertainty of the value of a standard.

The uncertainty measurement data for calibration is calculated externally to Maximo® Calibration. Information about calibration assets is exported from Maximo Calibration to the external system, where the information is calculated to determine the correct uncertainty data. The information is then imported into the calibration data sheet tables and the data sheet work order tables. When a data sheet is attached to a work order, the uncertainty measurement data is imported from the Data Sheet Template application.

You use the Manage integration framework to link Maximo Calibration to the external system. Before you configure Maximo Calibration for uncertainty data, you must complete the basic configuration tasks to set up your environment. See the information about basic configuration in the *IBM Maximo Asset Management Integration Guide*.

---

## Non-linear instruments in data sheets

Non-linear instruments are analog instruments that have their tolerance limits calculated based on the desired output value and not the nominal input value.

To indicate that an instrument is non-linear, select the Non-linear check box. If calibration points are already entered, they must be cleared before you can select non-linear.

When an instrument is selected as non-linear, the Engineering Unit (EU) is the only tolerance that is used. Also, the desired output value of the calibration point must be within the output range of the asset function.

---

## Tolerance limits on data sheets

Tolerance is an acceptable value or value range for a specified output value. You define the tolerance limits for accuracy of a calibration point on a data sheet.

You can specify up to four tolerance levels on a data sheet. Tolerance 1 is the tightest (or narrowest) tolerance and Tolerance 4 is the widest. Typically, the manufacturer of the asset establishes the tolerance limits.

---

## Example of using tolerance limits

Tolerance 1 is the output limit range that does not require adjustment for the asset. An asset passes calibration if the actual output value for the asset is within the limit range of Tolerance 1. No additional action is required.

The asset requires adjustment if the actual output value exceeds the limit range of Tolerance 1 but is within the limit range of Tolerance 2. The asset owner is also notified.

Tolerance limits are validated as tightest to widest by using the following criteria:

- Tolerance 1 lower limits > Tolerance 2 lower limits > Tolerance 3 lower limits > Tolerance 4 lower limits
- Tolerance 1 upper limits < Tolerance 2 upper limits < Tolerance 3 upper limits < Tolerance 4 upper limits

Tolerance limits are also validated by using the following criteria:

- The lower tolerance limit value, the From field, must be less than or equal to zero.
- The upper tolerance limit value, the To field, must be greater than or equal to zero.

When a technician enters As-found and As-left values on the work order data sheet, these values are validated to ensure that they are within the specified range.

---

## Creating data sheets

A data sheet is a template that defines the specifications of an asset for the calibration process. Data sheets give a technician the information necessary to calibrate an analog or discrete asset function.

## About this task

---

When you create a data sheet, the status default value is draft.

If you enter a value for an asset function using the comma as the thousand separator, the value becomes a decimal number. For example, if you enter 1,000 and your minimum field resolution is 3, then the value converts to 1.000 (one). If you enter 1000 and your minimum field resolution is 3, then the value converts to 1000.000 (one thousand).

## Procedure

---

1. In the Data Sheet Template application, click New Data Sheet and specify a data sheet name.
2. Create an asset function and specify the type of asset function.
3. Specify whether the asset function is a calibration point, a functional check point, or a dynamic check point.
4. Optional: To allow a field technician to add calibration point rows to a work order data sheet while performing a calibration, select the Technician Insert Points check box.
5. Specify the asset function information.
6. Specify either the calibration point information, the functional check point information, or the dynamic check point information of the asset function. This checkpoint information is according to the business rules for your company.
7. Save the data sheet.

## What to do next

---

Change the status of the data sheet to approved to add it to a work asset. You can then associate the data sheet to a job plan or to a work order.

- [Revising the version of a data sheet](#)  
Changes that are made to data sheets are saved by using revision control. Revision control maintains a historical record to troubleshoot calibration issues with assets when data sheet values have changed.
- [Revising the version of a data sheet](#)  
Changes that are made to data sheets are saved by using revision control. Revision control maintains a historical record to troubleshoot calibration issues with assets when data sheet values have changed.

---

## Revising the version of a data sheet

Changes that are made to data sheets are saved by using revision control. Revision control maintains a historical record to troubleshoot calibration issues with assets when data sheet values have changed.

## About this task

---

You can revise data sheets that are in approved status only. Data sheet revision numbers increment by 1. You can view the revision history of a data sheet from the Select Action menu. Work orders that the data sheet is attached to are not automatically updated.

When the status of the revised data sheet is set to approved, the status of the previous data sheet is set to Revised. The revised data sheet cannot be edited or reopened.

Job plans that are associated with the data sheet are automatically updated to the revised version.

## Procedure

---

1. In the Data Sheet Template application, select the data sheet that you want to revise.
2. From the Select Action menu, select Revise Data Sheet.
3. Enter a revision description and click OK.  
The status of the data sheet is set to Pending Revision.
4. Update the data sheet for this revision and save the changes.

## What to do next

---

You can change the status of the revised data sheet to either Waiting on Approval or Approved.

---

## Associating work assets with data sheets

When you associate an asset with a data sheet, you are attaching a template with predefined calibration points for the work asset.

## About this task

---

You can link one or more assets to a data sheet. You can use the current data sheet for multiple assets that have identical calibration data sheet requirements.

---

## Procedure

1. In the Data Sheet Template application, select the data sheet you want to associate with a work asset.
2. On the Work Assets tab, insert a row.
3. Specify either a location, an asset, or an item.  
If you select a location as the work asset, the Asset field is automatically populated.
4. Save the data sheet.

---

## Duplicating the asset function of a data sheet

When you create multiple data sheets with similar information, you can duplicate the asset function information to save time.

---

### About this task

You can duplicate the asset function information of a data sheet that is in draft status and pending revision status only.

---

## Procedure

1. In the Data Sheet Template application, select the asset function of the data sheet that you want to duplicate.
2. Click Duplicate Row.
3. Specify the asset function number and description.
4. Update any fields as required.
5. Save the record.

---

## Calibration calculations

During the calibration of an asset, calculations are used to determine whether the asset passes or fails the calibration. These calculations are based on the values that you specify on the data sheet.

The results of these calculations depend on the type of asset that is being calibrated. The results also depend on whether the tolerance levels are based on the input or the output information of the asset. Your desired output is the result that you want for your asset. The desired output is based on the direction of the values and whether the value is increasing or decreasing.

These calculations are processed on the Data Sheet tab in the Data Sheet application and the Work Order application.

- [Symbols used in calibration formulas](#)  
The calibration formulas use specific symbols. These symbols define the algorithms that are used in the calibration calculations.
- [Tolerance criteria for calibration calculations](#)  
The tolerance criteria in a data sheet determines which algorithm is used to calculate the lower and upper output limits for each tolerance level. Each tolerance criterion represents a specific calculation formula to calculate tolerance limits.
- [Single tolerance for calibration calculations](#)  
You can use a single tolerance criterion for each tolerance level. The single tolerance calculates the desired output.

## Symbols used in calibration formulas

The calibration formulas use specific symbols. These symbols define the algorithms that are used in the calibration calculations.

## List of the symbols used in calibration formulas

$i$	Input value: nominal or actual.
$i_{\text{lower}}$	Input range, lower limit.
$i_{\text{upper}}$	Input range, upper limit.
$i_a$	Actual input value (as found input).
$i_{\text{calc}}$	Calculated input value (input as calculated from the as found output).
$o_{\text{lower}}$	Output range lower limit.
$o_{\text{upper}}$	Output range upper limit.
$o_a$	Actual output value (as found output).
$o_{\text{calc}}$	Calculated output value (output as calculated from the input).
$\Delta i$	Input range span.
$\Delta o$	Output range span.
$r_{\text{lower}}$	Range limit From value (lower limit).
$r_{\text{upper}}$	Range limit To value (Upper limit).
Tolerance	Tolerance value entered, for example, +/- 2.5, +2.5 or -2.5.

## Tolerance criteria for calibration calculations

The tolerance criteria in a data sheet determines which algorithm is used to calculate the lower and upper output limits for each tolerance level. Each tolerance criterion represents a specific calculation formula to calculate tolerance limits.

Table 1. Criteria definitions and calculations

Criterion	Criteria definition	Tolerance calculation based on input	Tolerance calculation based on output
Engineering Units (EU)	Tolerances that are based on input are expressed in input units. The tolerance levels are always expressed in output units; therefore, a conversion must occur. The conversion is $\left(\frac{\Delta o}{\Delta i}\right)$ If the tolerance is based on output, then no conversion is required.	$\text{Tolerance} * \left(\frac{\Delta o}{\Delta i}\right)$	Tolerance
%Span	The values for the %Span criterion are calculated from the calibrated input span of the asset. The values are then converted to output units and are added to or subtracted from the desired output value to determine the range limits.  The span is the algebraic difference of the input upper and lower range values divided by 100.  If the tolerance is based on output, then no conversion is required.	$\text{Tolerance} * \left(\frac{\Delta i}{100}\right) * \left(\frac{\Delta o}{\Delta i}\right)$	$\text{Tolerance} * \left(\frac{\Delta o}{100}\right)$
%URV	The %URV criterion is the upper range value divided by 100. If the upper input range value is used, the value must be converted to output units before the tolerance is calculated. The converted tolerance is then added to or subtracted from the desired output value to determine the range limits.  If the tolerance is based on output, then no conversion is required.	$\text{Tolerance} * \left(\frac{r_{\text{upper}}}{100}\right) * \left(\frac{\Delta o}{\Delta i}\right)$	$\text{Tolerance} * \left(\frac{o_{\text{upper}}}{100}\right)$

Criterion	Criteria definition	Tolerance calculation based on input	Tolerance calculation based on output
%Reading	<p>The values for the %Reading criterion are calculated from the nominal input value applied to the asset. The values are then divided by 100, converted to output units, and added to or subtracted from the desired output value to determine the range limits.</p> <p>These values are not constant, but vary with nominal input.</p> <p>If the tolerance is based on output, then no conversion is required.</p>	$\text{Tolerance} * \left( \frac{i}{100} \right) * \left( \frac{\Delta o}{\Delta i} \right)$	$\text{Tolerance} * \left( \frac{o}{100} \right)$

## Single tolerance for calibration calculations

You can use a single tolerance criterion for each tolerance level. The single tolerance calculates the desired output.

You use one of two calculations to calculate the desired output. The calculation that is used depends on the direction of the input and the output. The desired output is calculated and then applied to the formulas to calculate tolerance limits.

Table 1. Single tolerance calculations

Description	Input and output	Calculation
Same direction increasing	<p>If Input From to Input To &lt; 0 and</p> <p>Output From to Output To &lt;= 0</p>	<p>Desired output</p> $= (i - i_{\text{Lower}}) * \left( \frac{\Delta o}{\Delta i} \right) + o_{\text{Lower}}$
Same direction decreasing	<p>If Input From to Input To &gt; 0 and</p> <p>Output From to Output To &gt;= 0</p>	<p>Desired output</p> $= (i - i_{\text{Lower}}) * \left( \frac{\Delta o}{\Delta i} \right) + o_{\text{Lower}}$
Opposite direction increasing/decreasing	<p>If Input From to Input To &lt; 0 and</p> <p>Output From to Output To &gt;= 0</p>	<p>Desired output</p> $= o_{\text{Upper}} - (i - i_{\text{Lower}}) * \left( \frac{\Delta o}{\Delta i} \right)$
Opposite direction decreasing/increasing	<p>If Input From to Input To &gt; 0 and</p> <p>Output From to Output To &lt;= 0</p>	<p>Desired output</p> $= o_{\text{Upper}} - (i - i_{\text{Lower}}) * \left( \frac{\Delta o}{\Delta i} \right)$

## Summed tolerance for calibration calculations

You can use summed tolerance criteria for each tolerance level. Summed tolerance is the total of single tolerance expressions.

The calculation converts the individual terms to corresponding output units and then adds all the output units together.

Summed Tolerance = Desired Output + EU + %Span + %URV + %Reading

The following figure shows the formula based on input (where T = tolerance):

Figure 1. Summed tolerance formula based on input

$$= (i - i_{\text{Lower}}) * \left( \frac{\Delta o}{\Delta i} \right) + o_{\text{Lower}} + \left[ T * \left( \frac{\Delta o}{\Delta i} \right) \right] + \left[ T * \left( \frac{\Delta i}{100} \right) * \left( \frac{\Delta o}{\Delta i} \right) \right] + \left[ T * \left( \frac{i_{\text{Upper}}}{100} \right) * \left( \frac{\Delta o}{\Delta i} \right) \right] + \left[ T * \left( \frac{i}{100} \right) * \left( \frac{\Delta o}{\Delta i} \right) \right]$$

The following figure shows the formula based on output (where T = tolerance):

Figure 2. Summed tolerance formula based on output

$$= (i - i_{\text{Lower}}) * \left( \frac{\Delta o}{\Delta i} \right) + o_{\text{Lower}} + \left[ T * \left( \frac{\Delta o}{100} \right) \right] + \left[ T * \left( \frac{o_{\text{Upper}}}{100} \right) \right] + \left[ T * \left( \frac{o}{100} \right) \right]$$

## Square root tolerance for calibration calculations

The square root calculation is used to perform the input limits and output tolerance calculations for differential pressure producing flow meters.

### Square root calculations

You select the Square Root of Input check box to use this calculation.

The formula for calculating the desired output is included in the square root equations.

The following figure shows the desired output calculation:

Figure 1. Desired output calculation

$$\sqrt{\left(\frac{i}{i_{upper}}\right)^2 * \Delta o + O_{Lower}}$$

Table 1 shows the positive square root equation and negative square root equation for each criterion.

Table 1. Single square root equations for input

Criterion	Description	Positive square root equations	Negative square root equations
EU	When the Square Root of Input check box is selected, the positive square root equation is used for the engineering unit criterion.  The negative square root equation is used if the input + tolerance is a negative number.	$\sqrt{\left(\frac{i + Tolerance}{i_{upper}}\right)^2 * \Delta o + O_{Lower}}$	$O_{Lower} - \sqrt{\left(\frac{i + Tolerance}{i_{upper}}\right)^2 * \Delta o}$
%Span	When the Square Root of Input check box is selected, the positive square root equation is used for the %Span criterion.  The negative square root equation is used if the input + tolerance is a negative number.	$\sqrt{\left(\frac{i + Tolerance(\Delta i / 100)}{i_{upper}}\right)^2 * \Delta o + O_{Lower}}$	$O_{Lower} - \sqrt{\left(\frac{i + Tolerance(\Delta i / 100)}{i_{upper}}\right)^2 * \Delta o}$
%URV	When the Square Root of Input check box is selected, the positive square root equation is used for the %URV criterion.  The negative square root equation is used if the input + tolerance is a negative number.	$\sqrt{\left(\frac{i + Tolerance(i_{upper} / 100)}{i_{upper}}\right)^2 * \Delta o + O_{Lower}}$	$O_{Lower} - \sqrt{\left(\frac{i + Tolerance(i_{upper} / 100)}{i_{upper}}\right)^2 * \Delta o}$
%Reading	When the Square Root of Input check box is selected, the positive square root equation is used for the %Reading criterion.  The negative square root equation is used if the input + tolerance is a negative number.	$\sqrt{\left(\frac{i + Tolerance(i / 100)}{i_{upper}}\right)^2 * \Delta o + O_{Lower}}$	$O_{Lower} - \sqrt{\left(\frac{i + Tolerance(i / 100)}{i_{upper}}\right)^2 * \Delta o}$

Table 2 shows the positive square root equation and negative square root equation for a summed square root.

Table 2. Summed square root equations for input

Description	Summed square root equation
Positive square root equations	$\sqrt{\frac{i + Tolerance + Tolerance(\Delta i / 100) + Tolerance(i_{upper} / 100) + Tolerance(i / 100)}{i_{upper}} * \Delta o + O_{Lower}}$
Negative square root equations	$O_{Lower} - \sqrt{\frac{i + Tolerance + Tolerance(\Delta i / 100) + Tolerance(i_{upper} / 100) + Tolerance(i / 100)}{i_{upper}} * \Delta o}$

## Reverse flow calculation for calibration calculations

The reverse flow calculation is used to perform the input limits and output tolerance calculations for linear assets, for example flow indicators in reverse flow.

You select the Reverse Flow check box to use this calculation.

The formula for calculating desired output is included in the following equations.

The following figure shows the desired output calculation:

Figure 1. Desired output calculation

$$\left( \left( \frac{i - i_{Lower}}{\Delta i} \right)^2 * \Delta o \right) + O_{Lower}$$

Table 1. Single squared equation for reverse flow

Criterion	Description	Squared equations
EU	When the Reverse Flow check box is selected, the squared equation is used for the engineering unit criterion.	$\left( \left( \frac{i - i_{Lower} + Tolerance}{\Delta i} \right)^2 * \Delta o \right) + O_{Lower}$
%Span	When the Reverse Flow check box is selected, the squared equation is used for the %Span criterion.	$\left( \left( \frac{(i - i_{Lower}) + Tolerance(\Delta i / 100)}{\Delta i} \right)^2 * \Delta o \right) + O_{Lower}$
%URV	When the Reverse Flow check box is selected, the squared equation is used for the %URV criterion.	$\left( \left( \frac{(i - i_{Lower}) + Tolerance(i_{upper} / 100)}{\Delta i} \right)^2 * \Delta o \right) + O_{Lower}$

Criterion	Description	Squared equations
%Reading	When the Reverse Flow check box is selected, the squared equation is used for the %Reading criterion.	$\left( \frac{(i - i_{\text{Lower}}) + \text{Tolerance} \left( \frac{ i }{100} \right)}{\Delta i} \right)^2 * \Delta o + o_{\text{Lower}}$

Figure 2. Summed squared equations. This equation calculates the reverse flow for summed squared criteria.

$$\left( \frac{(i - i_{\text{Lower}}) + \text{Tolerance} + (\text{Tolerance} \left( \frac{\Delta i}{100} \right)) + (\text{Tolerance} \left( \frac{|i_{\text{Upper}}|}{100} \right)) + (\text{Tolerance} \left( \frac{|i|}{100} \right))}{\Delta i} \right)^2 * \Delta o + o_{\text{Lower}}$$

## Preventive Maintenance module

You use the applications in the Preventive Maintenance module to manage the work performed on a regular schedule to keep assets running efficiently. The applications can help you to plan and budget for regular maintenance work by planning the labor, material, service, and tool needs of your regularly scheduled maintenance and inspection work orders.

- [Preventive Maintenance](#)  
Create preventive maintenance plans for work assets and locations in the Preventive Maintenance application.
- [Master PM](#)  
Use the Master PM application to manage master preventive maintenance records (PMs) that you use as templates for other PMs.

## Preventive Maintenance

Create preventive maintenance plans for work assets and locations in the Preventive Maintenance application.

You can use the Preventive Maintenance application to accomplish the following tasks:

- Create templates, called PM records (or PMs), that are used to generate scheduled preventive maintenance work orders.
- Provide detailed descriptions of preventive maintenance work that you perform by assigning job plans to PMs.
- Specify a preventive maintenance schedule for an asset or location. The schedule determines how often work orders are generated from PMs. The schedule can generate work orders based on elapsed time between work orders, on meter units used, or both.
- Select specific days, months, or seasons to generate work orders from a PM.
- Create a PM hierarchy to schedule a group of work orders for an asset or location hierarchy.
- [Preventive maintenance overview](#)  
Preventive maintenance (PM) records are templates for scheduled preventive maintenance work. They are used to generate preventive maintenance work orders. PMs can contain job plan and corresponding safety plan information that is copied to work orders.
- [Preventive maintenance frequency schedules](#)  
You specify a frequency schedule for a preventive maintenance (PM) to determine how often the PM generates work orders.
- [Preventive maintenance forecasting cron task](#)  
A cron task has been created in the Cron Task Setup application to support PM forecasting. The cron task can be configured to update your PM forecasts automatically, based on the criteria you provide.
- [Preventive maintenance hierarchies](#)  
A preventive maintenance (PM) hierarchy is a group of PMs with parent-child relationships. Use a PM hierarchy to schedule a group of work orders for an asset hierarchy or a location hierarchy.
- [Sequences for Preventive maintenance job plans](#)  
You can assign one or more job plans to a preventive maintenance (PM) record. If you assign more than one job plan to a PM, sequence numbers determine how often a plan is used.
- [Preventive maintenance alerts](#)  
A preventive maintenance (PM) alert is a list of almost-due PM records. It indicates that a preventive maintenance work order is about to become due for an asset or a location.
- [Working with preventive maintenance records](#)  
When you create PMs, you can associate routes, specify work order status, define frequency, set seasonal dates, assign job plans, and create hierarchies. After PMs are created, you can change the status, generate work orders, override the due date, set meters, and set counters.

## Preventive maintenance overview

Preventive maintenance (PM) records are templates for scheduled preventive maintenance work. They are used to generate preventive maintenance work orders. PMs can contain job plan and corresponding safety plan information that is copied to work orders.

Information associated with a PM becomes part of the work order records you generate from the PM. You can create parent-child relationships between similar PMs to build a PM hierarchy, which enables you to generate hierarchies of related work orders. You can also schedule PM work for assets on a route.

When you create PMs for assets or locations, you determine how to schedule work for them. You can create schedules based on the following conditions:

- Elapsed time since the target start date or completion date of previous work. PMs for this work are called time-based PMs.
- Metered asset usage since the target start date or completion date of previous work. PMs for this work are called meter-based PMs.
- A combination of elapsed time and metered usage. For example, you can schedule a PM to trigger work every six months or every 300 hours, whichever comes first.

You can create flexible schedules by using lead times, seasonal and extended dates, and by triggering work outside of a PM frequency cycle.

You can group PMs into hierarchies that model your assets and create PMs for routes. You can duplicate PM data by generating PMs from a template PM called a Master PM.

---

## Calculations used for meter-based PMs

Estimated next due date calculation

If the Generate Work Order Based on Meter Readings (Do Not Estimate) check box is selected, the system calculates the Estimated Next Due Date values for meter-based PMs as follows:

Estimated Next Due Date = Today's Date + (Next Meter Reading - Generate WO Ahead By - Current Meter Reading) / Average Units per Day

Next meter reading calculation

- If the Use Last Work Order's Start Date to Calculate Next Due Date check box on the Frequency tab is selected, then the Next Meter Reading = Meter Reading when the last work order was generated + Frequency.
- If the Use Last Work Order's Start Date to Calculate Next Due Date check box on the Frequency tab is cleared, then the Next Meter Reading = Meter Reading when the last work order was closed + Frequency.
- [Preventive maintenance statuses](#)  
Preventive maintenance statuses indicate the position of the PM in the processing cycle and determine whether work orders can be generated.
- [Seasonal preventive maintenance](#)  
A seasonal preventive maintenance (PM) record is a PM (or master PM) record that you can activate and deactivate to accommodate work that you do only during certain seasons.

---

## Preventive maintenance statuses

Preventive maintenance statuses indicate the position of the PM in the processing cycle and determine whether work orders can be generated.

DRAFT

PMs have a default status of DRAFT when you create them. Work orders cannot be generated from PMs with a DRAFT status. Typically PMs with this status are in the process of being created or modified.

ACTIVE

PMs must have an ACTIVE status to generate work orders. You can still modify a PM that has a status of ACTIVE.

INACTIVE

PM records that have an INACTIVE status do not generate work orders. Typically PMs with this status have been discontinued, either temporarily or permanently. You can change the status of a PM from INACTIVE to ACTIVE.

---

## Seasonal preventive maintenance

A seasonal preventive maintenance (PM) record is a PM (or master PM) record that you can activate and deactivate to accommodate work that you do only during certain seasons.

You can have multiple active seasons (seasons where work orders are generated) for a single PM. You can also determine on which days of the week a PM is active.

For example, you want PMs for a particular asset to generate work orders only during the summer and winter months. You define two active seasons for this PM, using the Seasonal Dates tab. Also, your company is closed on weekends. You do not want work orders generated on weekend days so you specify that work orders that become due on those days are scheduled for Monday instead.

---

## Preventive maintenance frequency schedules

You specify a frequency schedule for a preventive maintenance (PM) to determine how often the PM generates work orders.

Preventive maintenance work is typically triggered by one or more conditions:

- Elapsed time since previous work. Such PMs are called *time-based PMs*.
- Metered usage of assets. Such PMs are called *meter-based PMs*.
- A combination of elapsed time and metered usage. For example, you can schedule a PM that triggers work every six months or every 300 hours, whichever comes first.

You specify scheduling information about time based and meter based frequencies in the Frequency tab in the Preventive Maintenance application.

You can work with more complex schedules in the PM tab in the Preventive Maintenance application. You can use lead times, seasonal and extended dates, and trigger work outside of a PM frequency cycle for more complex schedules

## Fixed schedules and floating schedules

---

To schedule any master or associated PM, determine whether you want to do work on a fixed schedule or a floating schedule. On a fixed schedule, you plan work based on the target start date of the previous work. The target start increments by a frequency that you specify. On a fixed schedule, you can create multiple work orders in advance. On a floating schedule, you plan work based on the closure of the previous work. You cannot generate a new work order until the current one is completed on a floating schedule.

- When you create a fixed-schedule PM, the PM work is scheduled based on the value in the Last Start Date field on each associated PM. The Last Start Date field is on the PM tab of the Preventive Maintenance application.
- When you create a floating-schedule PM, the PM work is scheduled based on the value in the Last Completion Date field. The Last Completion Date field is on the PM tab of the Preventive Maintenance application.

---

## Preventive maintenance forecasting cron task

A cron task has been created in the Cron Task Setup application to support PM forecasting. The cron task can be configured to update your PM forecasts automatically, based on the criteria you provide.

Cron tasks are behind-the-scene jobs set to run automatically and on a fixed schedule. Changes to preventive maintenance (PM) records and work order generation affect forecast dates, rendering them inaccurate. You use the PMForecastCronTask to set up a schedule to update your PM forecasts in order to maintain accurate dates without having to regenerate the forecast manually. The cron task allows PM forecasts to be updated at predefined intervals.

You can set up multiple cron task instances, representing different types of assets, for different durations. For example, you want to update all PM forecasts on motors every six months, but you want to update the PM forecasts on pressure-control valves every five weeks. You can create a cron task instance for each scenario.

For more information about setting up cron tasks, see the Cron Task Setup application help.

---

## Preventive maintenance hierarchies

A preventive maintenance (PM) hierarchy is a group of PMs with parent-child relationships. Use a PM hierarchy to schedule a group of work orders for an asset hierarchy or a location hierarchy.

PM hierarchies generate an organized group of work orders for an asset or location hierarchy. Work is typically organized this way for inspections and large projects. If any PM in the hierarchy is due, it triggers a generation of work orders for the entire hierarchy.

At the highest level of a PM hierarchy, there is one parent PM. This top-level PM can have one or more child PMs. Each child PM can have one or more child PMs, and so on. A child PM can only have one parent PM.

You can add a sequence number to each PM in a PM hierarchy. The sequence number gives workers an indication of the order in which to perform the work. The sequence number is copied to the work orders that are generated from the PM. However, there is no validation on this number; duplicates and null values are allowed.

You can also generate simple work order hierarchies by applying a route to a PM.

You cannot delete a PM that is part of a hierarchy. You must remove it from the hierarchy before you can delete the PM.

- [Preventive maintenance records associated with routes](#)  
When you generate preventive maintenance (PM) records for assets or locations on a route, you create a simple work order hierarchy. This hierarchy has a parent work order for the asset or location on the PM record. The child records in the hierarchy are for each asset or location listed on the route.

---

## Preventive maintenance records associated with routes

When you generate preventive maintenance (PM) records for assets or locations on a route, you create a simple work order hierarchy. This hierarchy has a parent work order for the asset or location on the PM record. The child records in the hierarchy are for each asset or location listed on the route.

When a PM with an associated route generates a work order, the following work order data is used based on the assets on the route:

Sequence numbers

If there are sequence numbers on the assets on the route, they are applied to the generated work orders. Duplicate sequence numbers are allowed.

Job plans

The job plan for the asset's work order comes from the job plan for the asset at that stop on the route. If there is no job plan for the asset at the route stop, the plan comes from the PM record. Job plan tasks generate tasks on the associated work order.

Safety plans

If there is a default safety plan for this job plan when it is used with an asset, the safety plan is copied to the new work order.

---

## Sequences for Preventive maintenance job plans

You can assign one or more job plans to a preventive maintenance (PM) record. If you assign more than one job plan to a PM, sequence numbers determine how often a plan is used.

Job plan sequences let you schedule different levels of maintenance work at specified intervals.

For example, you can assign monthly, quarterly, and yearly job plans for work on an asset. The monthly job might be several simple maintenance tasks, while the quarterly and yearly jobs might be more complex.

You could add a sequence of three job plans to specify different inspections of a turbine:

- A monthly basic inspection of a turbine
- A quarterly inspection of its components
- A yearly inspection of the turbine and its feeder system

By assigning a sequence number to each job plan, you specify which job plan is selected each time a work order is generated from the PM.

## How job plans are selected

When you generate a work order from a PM, the system first increments the value in the Counter field by one, then selects the job plan. The system selects the job plan with the highest sequence number that divides evenly into the value in the Counter field. If no sequence number meets this criterion, the primary job plan (sequence number one) is used. The value in the Sequence field means that this job plan would be used on every *n*th work order generated from the PM, where *n* is the sequence number.

## Example: Job plan sequence for a turbine

For the turbine inspections, you would create a job plan sequence as follows:

Table 1. Example of a job plan sequence for turbine inspections

Job Plan	Description	Sequence	Meaning
INS-TURB	Inspect turbine	1	This job plan is the default or primary job plan. It is used unless the sequence calls for a different plan. This job plan is used when the value in the Counter field is divisible only by one.
INS-TURBCOMP	Inspect turbine components	3	This job plan is used when three is the highest number that divides evenly into the value of the Counter field.
INS-TURBFEEED	Inspect turbine and feeder system	12	This job plan is used when 12 is the highest number that divides evenly into the value of the Counter field.

- [Preventive maintenance counters](#)

The preventive maintenance (PM) counter specifies the number of work orders that were generated from a PM since the first start date.

## Preventive maintenance counters

The preventive maintenance (PM) counter specifies the number of work orders that were generated from a PM since the first start date.

You can view the current counter setting on the PM tab. The counter is set to zero when you insert a new PM record. It increases each time you generate a top-level work order from the PM. Child work orders do not increase the counter value on the top-level PM.

When you generate a work order from a PM with a job plan sequence, the job plan with the highest sequence number that divides evenly into the value in the Counter field is selected. If no sequence number meets this criterion, the primary job plan (sequence number one) is used.

You can change the value of the PM counter, typically if you want the PM to use a different job plan than the one that is scheduled to be next.

## Preventive maintenance alerts

A preventive maintenance (PM) alert is a list of almost-due PM records. It indicates that a preventive maintenance work order is about to become due for an asset or a location.

If the following criteria are met, the system displays the PM Alert window:

- The PM alert functionality was enabled in the PM Options window in the Organizations application. This includes indicating a work order status at which PM alerts are enabled.
- The corrective maintenance work order reaches the status defined in the Organizations application.

The frequency criteria for the PM are defined as follows:

Table 1. Frequency criteria for PMs

For:	a PM alert is generated if:
time-based PMs	the Next Due Date minus the Alert Lead is less than or equal to the system date.
meter-based PMs on an asset:	the Next Meter Reading minus the Meter Reading, minus the Alert Lead is less than or equal to zero.
meter-based PMs on a location:	the Next Meter Reading minus the Meter Reading, minus the Alert Lead is less than or equal to zero.

- [Preventive maintenance lead time](#)

Lead time is an amount of time that you specify on a preventive maintenance (PM) record so that work orders are generated in advance of their next due dates.

- [Preventive maintenance next due dates](#)

The next due date of a preventive maintenance (PM) record is the date it is next scheduled to generate a work order.

---

## Preventive maintenance lead time

Lead time is an amount of time that you specify on a preventive maintenance (PM) record so that work orders are generated in advance of their next due dates.

There are two types of lead time:

- lead time that is added to a single top-level PM to allow advance time for gathering tools and materials.
- slack time that is added to one or more PMs to allow generation of weekly or monthly batches of work orders.

The system adds lead time and slack time to the system date when determining whether a PM will generate a work order.

---

## Preventive maintenance next due dates

The next due date of a preventive maintenance (PM) record is the date it is next scheduled to generate a work order.

Due dates apply to any PMs that have the Use Frequency Criteria check box selected.

The next due date is determined by comparing values in the Estimated Next Due Date field on the Frequency tab of a PM, and the using the earliest date.

Other frequency criteria such as lead time, seasonal dates, and extended dates can affect when a PM generates a work order. For example, if a due date falls outside of the seasonal dates, the system finds the earliest date that falls in the active season and generates the work order for that date instead.

In addition, if the PM is part of a hierarchy, it can generate a work order because another PM in the hierarchy is due and it triggers all PMs in the hierarchy to generate work orders.

---

## Example: Next due date for an oil change

A PM for an oil change is both time-based and meter-based. It is scheduled to generate a work order every 3,000 miles or three months, whichever comes first. The estimated next due date on the Time Based Frequency subtab might be January 30, based on average time elapsed between previous oil changes. The estimated next due date on the Meter Based Frequency subtab might be January 15, based on average mileage. The next due date for this PM would be January 15, the earlier of the two dates.

---

## Working with preventive maintenance records

When you create PMs, you can associate routes, specify work order status, define frequency, set seasonal dates, assign job plans, and create hierarchies. After PMs are created, you can change the status, generate work orders, override the due date, set meters, and set counters.

- [Creating preventive maintenance records](#)  
Create preventive maintenance (PM) records to generate work orders for preventive maintenance work that you schedule.
- [Generating work orders from preventive maintenance records](#)  
You can generate work orders from PM records.
- [Adding an extended date to a preventive maintenance record](#)  
Add an extended date to a preventive maintenance (PM) record to override the typical next due date for generating PM work orders.
- [Setting meter values on a preventive maintenance record based on the reading at the last work order](#)  
Set a meter value from the last work order on a preventive maintenance (PM) record when you create a PM for an asset that has a meter history.
- [Setting preventive maintenance counters](#)  
If you have the appropriate access, you can reset the preventive maintenance (PM) counter. You might reset the PM counter if you want the PM to use a different job plan than the one that is scheduled to be next.

---

## Creating preventive maintenance records

Create preventive maintenance (PM) records to generate work orders for preventive maintenance work that you schedule.

---

### Procedure

1. In the Preventive Maintenance application, on the toolbar, click New PM. If the PM field is empty, specify a value.
2. Enter a description. Click Long Description if you need more space.
3. In the Location, Asset, or GL Account fields, specify a value.  
The asset or location is the entity for which you intend to schedule work - you must enter a value in one of these fields. If you have specified a GL account, when work orders are generated from the PM record, the system takes any unspecified segments from the associated location and or asset.
4. Optional: Build a PM for the assets on a route. In the Route field, specify a value.
5. Fill the remaining required fields as appropriate.

Select the Use this PM to Trigger PM Hierarchy check box if you want to generate work orders for the entire hierarchy when this PM becomes due. If you want to generate a work order for only this PM when it becomes due, and not the other PMs in the hierarchy, clear the check box.

Select the Child Work Orders and Tasks Will Inherit Status Changes check box if you want work orders generated from this PM to inherit status changes from a parent work order.

6. Click the Frequency tab. In the Work Order Generation Information section, select the following check boxes as appropriate:

- **Use Last Work Order's Start Date to Calculate Next Due Date**  
Select this check box if you want generated work orders to be calculated from the target start date of the last work order. If you do not want to calculate the Next Due Date based on the target start of the last work order (for example, if you want the next work order to be generated when the last work order was completed instead), clear the check box.
- **Generate Work Order Based on Meter Readings (Do Not Estimate)**  
Select this check box if you want work orders generated only when the defined meter reading has been reached. Clear this check box if you want the next work order due date to be based on the average metered usage.
- **Generate Work Order When Meter Frequency is Reached**  
Select this check box if you want work orders for this PM to be automatically generated when the meter frequency has been reached and entered. This check box can only be selected if the Generate WO Based on Meter Reading (Do Not Estimate) check box has been selected.

7. Define the frequency with which you want the PM to generate work orders. The PM frequency can be time-based, meter-based, or both.

- For time-based master PMs, define the frequency criteria as wanted.
- For meter-based master PMs, define the frequency criteria as wanted.

8. If the PM is a seasonal PM, define the days/dates that you want the PM to be active on the Seasonal Dates tab.

9. On the Job Plan Sequence tab, enter job plan data for the PM.

10. If the PM is the parent record in a PM hierarchy, define the child PMs on the PM Hierarchy tab.

11. Click Save PM.

- **[Defining alert lead time for preventive maintenance records](#)**  
You can define the lead time for preventive maintenance (PM) alert messages so that alerts display before work orders are generated.
- **[Defining seasonal dates for work order generation](#)**  
You can specify the active months or seasons of a preventive maintenance (PM) record. The PM only generates work orders during those periods that you specify.
- **[Assigning job plans to preventive maintenance records](#)**  
You can assign a job plan to a preventive maintenance (PM) record so that the job plan becomes a work plan on any work order you generate from the PM.
- **[Creating hierarchies of preventive maintenance records](#)**  
Create a preventive maintenance (PM) hierarchy to mirror an asset or location hierarchy, so that work orders generated from the PM hierarchy are organized in a logical manner.
- **[Preventive maintenance forecasting](#)**  
You can generate preventive maintenance (PM) forecasts from the Preventive Maintenance application.

---

## Defining alert lead time for preventive maintenance records

You can define the lead time for preventive maintenance (PM) alert messages so that alerts display before work orders are generated.

---

### Procedure

1. In the Preventive Maintenance application, display the PM record that you want to define alert lead time for.

2. Click the Frequency tab.

- For time-based PMs, on the Time Based Frequency subtab, specify the alert lead time (in days) in the Alert Lead (Days) field.
- For meter-based PMs, click the Meter Based Frequency subtab, then click the Detail Menu to display the meter information. If no meter was previously defined, define one now by clicking New Row. Specify the alert lead (in meter frequency units) in the Alert Lead field.

3. Click Save PM.

- **[Defining frequency for time-based preventive maintenance records](#)**  
You can define frequency for a time-based preventive maintenance (PM) record to specify how often work orders are generated from it. For time-based PMs, the generation criteria is based on elapsed time since the target start date or completion date of previous work.
- **[Defining frequency for meter-based preventive maintenance records](#)**  
You can define a frequency schedule for a meter-based preventive maintenance (PM) record to specify how often work orders are generated from it. For meter-based PMs, the generation criteria is based on metered asset usage since the target start date or completion date of previous work.

---

## Defining frequency for time-based preventive maintenance records

You can define frequency for a time-based preventive maintenance (PM) record to specify how often work orders are generated from it. For time-based PMs, the generation criteria is based on elapsed time since the target start date or completion date of previous work.

---

### About this task

If the PM has a lead time, then it needs to be generated that many days before it is due. Both the lead time specified in the organization setup and the lead time specified on the Generation window in the PM application are used to generate PMs in advance. If you specify a lead time of 5 days in the organizational setup and 5 days in the PM application, then the PM should be generated 10 days before the PM is due.

If the PM is associated with a master PM, updates to the master PM record overwrite changes you made to the frequency of the associated PM. If you want to prevent updates by the master PM, select the Override Updates from Master PM check box on the PM tab.

## Procedure

---

1. In the Preventive Maintenance application, select the PM record that you want to define frequency for.
2. On the Frequency tab, determine whether you want the PM to be on a fixed or floating schedule. In the Work Order Generation Information section, select the following check boxes as appropriate:
  - **Use Last Work Order's Start Date to Calculate Next Due Date**  
Select this check box if you want the due dates of generated work orders to be calculated from the target start date of the last work order. If you do not want to calculate the next due date based on the target start of the last work order, clear the check box. For example, if you want the next work order to be generated when the last work order was actually completed instead of when it started, clear the check box.
  - **Generate Work Order Based on Meter Readings (Do Not Estimate)**  
Select this check box if you want work orders generated only when the defined meter reading has been reached. Clear this check box if you want the next work order due date to be based on the average metered usage.
  - **Generate Work Order When Meter Frequency is Reached**  
Select this check box if you want work orders for this PM to be automatically generated when the meter frequency has been reached and entered. This check box can only be selected if the Generate Work Order Based on Meter Readings (Do Not Estimate) check box has been selected.
3. On the Time Based Frequency subtab, determine how much time you want to elapse between generating work orders from the PM. Enter or select the appropriate information in the Frequency and Frequency Units fields.
4. In the Estimated Next Due Date field, specify a value.  
This date is the first date that the PM is scheduled to generate work orders.
5. Click Save PM.

---

## Defining frequency for meter-based preventive maintenance records

You can define a frequency schedule for a meter-based preventive maintenance (PM) record to specify how often work orders are generated from it. For meter-based PMs, the generation criteria is based on metered asset usage since the target start date or completion date of previous work.

### About this task

---

If the PM is associated with a master PM, updates to the master PM record overwrite changes you make to the frequency of the PM. If you want to prevent updates by the master PM, select the Override Updates from Master PM check box on the PM tab.

## Procedure

---

1. In the Preventive Maintenance application, select the PM that you want to define frequency for.
2. On the Frequency tab, determine whether you want the PM to be on a fixed or floating schedule. In the Work Order Generation Information section, select the following check boxes as appropriate:
  - **Use Last Work Order's Start Date to Calculate Next Due Date**  
Select this check box if you want the due dates of generated work orders to be calculated from the target start date of the last work order. If you do not wish to calculate the next due date based on the target start of the last work order (for example, if you want the next work order to be generated when the last work order was completed instead), clear the check box.
  - **Generate Work Order Based on Meter Readings (Do Not Estimate)**  
Select this check box if you want work orders generated only when the defined meter reading has been reached. Clear this check box if you want the next work order due date to be based on the average metered usage.
  - **Generate Work Order When Meter Frequency is Reached**  
Select this check box if you want work orders for this PM to be automatically generated when the meter frequency has been reached and entered. This check box can only be selected if the Generate Work Order Based on Meter Readings (Do Not Estimate) check box has been selected.
3. On the Meter Based Frequency subtab, click New Row.
4. Determine how much metered activity should occur between PM work orders for this asset. In the Meter field, specify a value.  
You can only select continuous-type meters.
5. Optional: Specify values in the Frequency and First Start Reading fields.  
The First Start Reading value will be the first meter reading at which the PM will generate work orders.
6. Optional: To define multiple meter frequency criteria, repeat steps 3 through 5.
7. Click Save PM.

---

## Defining seasonal dates for work order generation

You can specify the active months or seasons of a preventive maintenance (PM) record. The PM only generates work orders during those periods that you specify.

### About this task

---

A PM can have more than one active season.

An extended date on the PM overrides seasonal dates. If the extended date on a PM changes the due date to one that is outside the active season, you can generate work orders from that PM.

If the PM is associated with a master PM, updates to the master PM record overwrite changes you make to the seasonal dates on the associated PM when you update existing PMs. To prevent updates by the master PM, select the Override Updates from Master PM check box on the PM tab.

---

## Procedure

1. In the Preventive Maintenance application, display the PM record you want to define active dates for.
2. On the Seasonal Dates tab, in the Active Dates section, click New Row.
3. Specify values for the start month and start day, and the end month and end day for the active season.
4. To define multiple active seasons, repeat steps 2-3.
5. Click Save PM.

- [Defining when work orders are generated](#)

You can specify on which days of the week a PM is active. Work orders are generated from PMs only on the specified active days.

---

## Defining when work orders are generated

You can specify on which days of the week a PM is active. Work orders are generated from PMs only on the specified active days.

---

### About this task

An extended date on the PM overrides seasonal dates. If the extended date on a PM changes the due date to one that is outside the active season, you can generate work orders from that PM.

If the PM is associated with a master PM, updates to the master PM record overwrite changes you make to the seasonal dates on the associated PM when you update existing PMs. To prevent updates by the master PM, select the Override Updates from Master PM check box on the PM tab.

---

## Procedure

1. In the Preventive Maintenance application, select the PM record you want to define active days for.
2. On the Seasonal Dates tab, in the Active Days section, select the check boxes for each day that you want the PM to generate work orders. To keep the PM from generating work orders on a certain day, clear the check box for that day.
3. Click Save PM.

---

## Assigning job plans to preventive maintenance records

You can assign a job plan to a preventive maintenance (PM) record so that the job plan becomes a work plan on any work order you generate from the PM.

---

### About this task

If a job plan has a default safety plan when used with the selected work asset, the safety plan is copied to the work order.

When you add a single job plan to the Job Plan Sequence tab, the job plan does not appear in the Job Plan field on the PM tab. A job plan only appears in the Job Plan field of the PM tab when the following criteria are met:

- you add the job plan directly to the PM tab
- you add more than one job plan on the Job Plan Sequence tab

If the PM is associated with a master PM, updates to the master PM record overwrite changes you made to the job plan data on the PM. If you want to prevent updates by the master PM, select the Override Updates from Master PM check box on the PM tab.

---

## Procedure

1. In the Preventive Maintenance application, display the PM record that you want to assign a job plan to.
2. On the PM tab, in the Job Plan field, specify a value.
3. Click Save PM.

- [Assigning multiple job plans to preventive maintenance records](#)

You can assign multiple job plan to a preventive maintenance (PM) record so that the job plans become a work plan on any work order you generate from the PM. When you assign multiple job plans, assign sequence numbers to the job plans to specify how often the PM uses each plan.

---

## Assigning multiple job plans to preventive maintenance records

You can assign multiple job plan to a preventive maintenance (PM) record so that the job plans become a work plan on any work order you generate from the PM. When you assign multiple job plans, assign sequence numbers to the job plans to specify how often the PM uses each plan.

## About this task

---

If a job plan has a default safety plan when used with the selected work asset, the safety plan is copied to the work order.

If the PM is associated with a master PM, updates to the master PM record overwrite changes you made to the job plan data on the PM. If you want to prevent updates by the master PM, select the Override Updates from Master PM check box on the PM tab.

## Procedure

---

1. In the Preventive Maintenance application, display the PM record that you want to assign job plans to.
2. On the Job Plan Sequence tab, click New Row.
3. In the Job Plan field, specify a value.
4. In the Sequence field, specify a number.
5. Repeat steps 2 through 4 for each job plan that you want to add to the PM.
6. View the job plan sequence to check that it provides the sequence that you want.
7. Click Save PM.

## Creating hierarchies of preventive maintenance records

---

Create a preventive maintenance (PM) hierarchy to mirror an asset or location hierarchy, so that work orders generated from the PM hierarchy are organized in a logical manner.

## Before you begin

---

Create a PM for each asset in the hierarchy, then group the PMs so they generate a hierarchy of work orders for the assets.

## About this task

---

There is a single top-level PM. This PM can have one or more child PMs. Each child PM can have one or more child PMs, and so on. A child PM can only have one parent PM.

You cannot delete a PM that is part of a hierarchy. You must remove it from the hierarchy before you can delete the PM.

## Procedure

---

1. In the Preventive Maintenance application, display the PM record that you want to create a hierarchy for.
  2. Click the PM Hierarchy tab.
  3. Optional: In the Parent field, specify a value.
  4. Add one or more child PMs.
    - a. Click New Row in the Children window.
    - b. In the PM field, specify a value.

If the child PM has an associated asset or location record, that data is automatically entered in the appropriate fields for the child PM.
    - c. Optional: In the Sequence field, specify a number.
  5. Click Save PM.
- [Changing the parent preventive maintenance records in a preventive maintenance hierarchy](#)  
You can change the parent in a preventive maintenance (PM) record hierarchy to remove a child PM from one parent and associate it with a different parent.
  - [Removing child preventive maintenance records from a preventive maintenance hierarchy](#)  
You can remove a child preventive maintenance (PM) record from a PM hierarchy to make the PM a top-level PM.
  - [Removing parent preventive maintenance records from a preventive maintenance hierarchy](#)  
You can remove a parent preventive maintenance (PM) record from a PM hierarchy so that a child PM of the parent PM becomes a top-level PM.

## Changing the parent preventive maintenance records in a preventive maintenance hierarchy

---

You can change the parent in a preventive maintenance (PM) record hierarchy to remove a child PM from one parent and associate it with a different parent.

## Procedure

---

1. In the Preventive Maintenance application, select the child PM record that you want to change the parent for.
2. Click the PM Hierarchy tab.
3. Delete the value in the Parent field and specify a new value.
4. Click Save PM.

## Results

---

The child PM is removed from the previous parent and is associated with the new parent.

---

## Removing child preventive maintenance records from a preventive maintenance hierarchy

You can remove a child preventive maintenance (PM) record from a PM hierarchy to make the PM a top-level PM.

### Procedure

---

1. In the Preventive Maintenance application, select the parent PM record that you want to remove child PMs from.
2. Click the PM Hierarchy tab.
3. Find the row in the Children table window containing the PM that you want to remove and click Mark Row for Delete.
4. Click Save PM.

### Results

---

The PM is removed from the hierarchy and is made a top-level PM.

---

## Removing parent preventive maintenance records from a preventive maintenance hierarchy

You can remove a parent preventive maintenance (PM) record from a PM hierarchy so that a child PM of the parent PM becomes a top-level PM.

### Procedure

---

1. In the Preventive Maintenance application, select the child PM record that you want to remove a parent from.
2. Click the PM Hierarchy tab.
3. Delete the value in the Parent field.
4. Save the record.

### Results

---

The PM is removed from the hierarchy. The PM becomes a top-level PM.

---

## Preventive maintenance forecasting

You can generate preventive maintenance (PM) forecasts from the Preventive Maintenance application.

- [Preventive maintenance forecast logic](#)  
You can generate a forecast by using the Generate Forecast action in the Preventive Maintenance application, or by using the PM Forecast cron task. When you forecast a preventive maintenance (PM) record, the forecast is generated based on the frequency criteria that are specified on the Frequency tab, and seasonal information. The generated forecast appears on the Forecast tab of the Preventive Maintenance application.
- [Forecast edit rules](#)  
You can edit the forecast dates of a PM under certain circumstances. For example, you might need to change a forecast date to accommodate a vacation or a plant shut down.
- [Deleting forecasts](#)  
You can delete forecasts that are erroneous or no longer needed from the Preventive Maintenance application.
- [Editing records when a PM forecast exists](#)  
If you make edits to records in Maximo® Asset Management that affect a preventive maintenance (PM) forecast, there are restrictions and business rules that apply.
- [Callable actions for PM forecasting](#)  
Certain actions within the Actions application were created in order to allow you to set up automated processes for PM forecasting.

---

## Preventive maintenance forecast logic

You can generate a forecast by using the Generate Forecast action in the Preventive Maintenance application, or by using the PM Forecast cron task. When you forecast a preventive maintenance (PM) record, the forecast is generated based on the frequency criteria that are specified on the Frequency tab, and seasonal information. The generated forecast appears on the Forecast tab of the Preventive Maintenance application.

The forecast logic is as follows:

---

## Time-based PMs

When a PM is time-based, the Estimated Next Due Date is calculated by taking the current date and adding the frequency and frequency units to it. For example, a Frequency of 3 with a Frequency Unit of days would add three days to the current date. The Estimated Next Due Date then becomes the first forecasted PM date. Subsequent forecasted dates continue in the same frequency until the end of the forecast duration. Seasonal information, such as active days and dates, is taken into account during forecasting.

- First Forecast Date = Estimated Next Due Date where Estimated Next Due Date = Current Date + Frequency (Frequency/Units)
- Subsequent Forecast Dates = Previous Forecast Date + Frequency

## Meter-based PMs

---

When a PM is meter-based, the forecast uses the value in the Average Meter Units/Day field to determine the Estimated Next Due Date. Subsequent forecasted dates are determined by the Average Meter Units/Day value. Because a meter-based forecast is generated based on average meter units, any change to the average deletes the forecast. No forecast is generated if the last meter reading date is null or if the Average Meter Units/Day is zero. When the Average Meter Units/Day change, the forecast is deleted. Seasonal information, such as active days and dates, is taken into account during forecasting.

- Estimated Next Due Date = Last Start Date + (Meter Frequency days/Average Meter Units per Day)
- Subsequent Forecast Dates = Previous Forecast Date + (Meter Frequency days/Average Meter Units per Day)

## Seasonal dates

---

Seasonal Dates are taken into account during forecasting. If the projected forecast date for a PM occurs in an inactive season, the PM is forecasted on the earliest date in an active season (that occurs after the Next Due Date).

## Target start dates

---

If the Use Last Work Order's Start Date to Calculate Next Due Date field is selected, the PM is forecasted based on the Estimated Next Due Date of the previous PM record. If the field is not selected (meaning that the next PM forecast is calculated based on the completion date of the previous forecasted instance), the forecast is based on the previous forecast date plus the job plan duration from the job plan that is associated with the PM. If no job plan duration is available for the PM, the forecast is based solely on the frequency criteria.

## Extended dates

---

If a PM contains an Extended Date on its Frequency tab, the Extended Date overrides the Estimated Next Due Date in a forecast. The first forecasted date is equal to the Extended Date. All subsequent forecasts, however, are based on the Estimated Next Due Date, not the Extended Date, unless the Adjust Next Due Date check box is selected. For example, a PM has a frequency of three days, an Estimated Next Due Date of December 1, and an Extended Date of December 2. The Adjust Next Due Date check box is cleared (set to No). When a forecast is generated, the first forecast date is December 2. Subsequent forecast dates (based on the Estimated Next Due Date of December 1) are December 4, December 7.

When a forecast has been generated, the Extended Date is cleared, and the field becomes read-only. Any changes to the forecast dates must be entered in the New Date field.

## When a forecast exists

---

When a forecast exists for a PM record, you can extend the forecast period by changing the date in the Forecast Until field in the Generate Forecast window. If the date you enter is after the date in the Last Forecast Date field, the new forecast dates are added to the existing forecast on the Forecast tab. The date that you enter in the Forecast Until field must be a date that is 30 days after the Last Forecast Date.

For example, if the Last Forecast Date of a PM is 12/31/2009, and you enter 02/28/2010 in the Forecast Until field, any forecasted dates between December 31 and February 28 are added to the existing forecast on the Forecast tab.

## Duplicated PMs

---

When you duplicate a PM record, forecasts that exist for the original record are not duplicated. To generate forecasts for the new PM, select Generate Forecast action, or wait for the PM Forecast cron task to run.

## PM hierarchies

---

Child PMs are forecasted when a Parent PM is forecasted.

## Forecast edit rules

---

You can edit the forecast dates of a PM under certain circumstances. For example, you might need to change a forecast date to accommodate a vacation or a plant shut down.

You can edit a forecast date by entering a date in the New Date field. You can enter a New Date for one forecast instance at a time. The New Date, and accompanying comments, remain visible on the Forecast tab indefinitely. You can reforecast by using the prompt message at Save, selecting the Generate Forecast action, or by clicking the Process Pending Reforecast button.

Restrictions as to which dates in a forecast can be edited are as follows:

- You can enter a New Date only for the first forecast date of a meter-based PM, not for subsequent dates. Since the first forecasted date is based on the Estimated Next Due Date, you can modify that date in the forecast. Subsequent forecast dates are determined by the Average Units per Day, so they are approximate.
- You can enter a New Date only for the first forecast date of a PM that has its Use Last Work Order's Start Date to Calculate Next Due Date check box cleared. You cannot edit subsequent dates, as they are approximate.

Other restrictions for editing forecasts include:

- If the Reforecast Subsequent Dates field is selected, subsequent forecast dates are recalculated when you generate the forecast again, or when the PMForecast cron task runs. Forecast dates that are awaiting reforecast have the Reforecast Pending check box selected. Until the forecast is regenerated, no other changes to forecast dates can be made.
- You cannot enter a New Date that is the same as, or earlier than, the previous forecast date.
- If the Reforecast Subsequent Dates field is cleared, you cannot enter a New Date that is later than the next forecast date.

You can clear a pending forecast if you want to change a New Date that you entered before the forecast has been regenerated.

## Forecast locks

You can lock or unlock a forecast based on your business needs. New dates cannot be entered in a locked forecast. The Lock Forecast Dates and Unlock Forecast Dates actions are available in the Preventive Maintenance application.

## Deleting forecasts

You can delete forecasts that are erroneous or no longer needed from the Preventive Maintenance application.

### Procedure

1. In the PM application, display the preventive maintenance record that you want to delete the forecast for.
2. Select the Delete Forecast action.

- [Preventive maintenance forecast deletion rules](#)  
You can delete a PM forecast that is erroneous or no longer needed.

## Preventive maintenance forecast deletion rules

You can delete a PM forecast that is erroneous or no longer needed.

When you generate a forecast for a PM or PM hierarchy for the first time, all forecast dates are accurate and up-to-date. However, if you change the PM record and then generate the forecast again, new dates are forecasted based on the updated data, but old dates also remain in the forecast. The only way to remove all erroneous dates from the forecast is to delete the forecast, and then regenerate it. For example, if the frequency criteria on a PM has changed, the forecast might be inaccurate. Generating the forecast again adds new forecast dates, but does not delete forecast dates that were based on the original frequency criteria. To create a clean forecast, delete the initial forecast, and then regenerate.

You can delete a forecast directly from the preventive maintenance record, or from the List tab of the PM application.

The logic for deleting a forecast is as follows:

### Deleting a single PM from a forecast

When a PM that is not part of a PM hierarchy has a forecast, you can delete the entire forecast, or any instances within the forecast. You can delete all forecasted dates at once, or only the ones that you select.

### Deleting a PM hierarchy from a forecast

When a PM hierarchy has a forecast, the entire forecast can be deleted, but only at the parent level. Deleting a parent from the forecast automatically deletes any children of that parent from the forecast as well. The children cannot be deleted from the forecast on their own.

## Changing a PM hierarchy that has been forecasted

When a PM hierarchy has a forecast, any changes to the structure of the hierarchy render a forecast inaccurate. When you change the PM hierarchy, the original forecast is automatically deleted. You must regenerate the forecast by selecting the Generate Forecast action or by using the PM Forecast cron task.

### Deleting a forecast date

You can delete a forecast date in the Preventive Maintenance application. In a time-based PM, you can delete dates from the bottom of the forecast up. In meter-based PM, or in a PM in which the Use Last Work Order's Start Date to Calculate Next Due Date check box is cleared, forecast dates cannot be deleted. In this case, you must delete the entire forecast and regenerate it in the Preventive Maintenance application. You cannot delete a forecast date from a schedule in the Scheduler application.

## Other changes that affect the PM forecast

When you change the dates or frequency information of a PM, it affects the accuracy of an existing forecast. The forecast is deleted. The fields are as follows:

Tab	Field
PM	<ul style="list-style-type: none"><li>• Include This PM in the Forecast</li><li>• Job Plan</li><li>• Status</li></ul>
Frequency (Time Based)	<ul style="list-style-type: none"><li>• Frequency</li><li>• Frequency Units</li><li>• Use Last WO's Start Information to Calculate Next Due Frequency</li></ul>
Frequency (Meter Based)	<ul style="list-style-type: none"><li>• Meter (insertion or deletion)</li><li>• Frequency</li></ul>
Seasonal Dates	<ul style="list-style-type: none"><li>• Days</li><li>• Active Dates</li><li>• Start Month/Start Day</li><li>• End Month/End Day</li></ul>
Job Plan Sequence	<ul style="list-style-type: none"><li>• Job Plan</li></ul>

## Forecast locks

You can lock or unlock a forecast based on your business needs. New dates cannot be entered in a locked forecast. The Lock Forecast Dates and Unlock Forecast Dates actions are available in the Preventive Maintenance application.

## Editing records when a PM forecast exists

If you make edits to records in Maximo® Asset Management that affect a preventive maintenance (PM) forecast, there are restrictions and business rules that apply.

- [PM edits when a forecast exists](#)  
When you change a preventive maintenance record that has an existing forecast, the forecast can be affected.
- [Work order generation of forecasted PMs](#)  
When a preventive maintenance (PM) record becomes due, a work order is generated. If a forecast exists for the preventive maintenance record, it is affected.
- [Work order cancellation when a forecast exists](#)  
When you cancel a work order for a preventive maintenance (PM) record for which a forecast exists, the cancellation can affect the forecasted dates.

## PM edits when a forecast exists

When you change a preventive maintenance record that has an existing forecast, the forecast can be affected.

The dates within a PM forecast are determined by the values in certain fields on the preventive maintenance record, for example, frequency and seasonal information. When you edit these fields, the forecast for the PM becomes inaccurate. After a warning message indicates the conflict, the forecast is deleted. You must generate a new forecast that includes the updated information, or wait for the PMForecast cron task to run.

PM field changes that affect the forecast include the following:

- Include This PM in the Forecast field
- Frequency information
- Seasonal Dates information
- insertion or deletion of job plan sequences

## PM counter

When a forecast exists, the PM counter alters the order of the job plans in the forecast (if a job plan sequence exists). Changes to the PM counter affect the PM forecast in the following ways:

- If the Use Last WO's Start Information to Calculate Next Due Frequency check box is selected (set to Yes), the forecast dates remain the same, and the job plan information is automatically updated on the Forecast tab.
- If the Use Last WO's Start Information to Calculate Next Due Frequency check box is cleared (set to No), the forecast is deleted. You must generate a new forecast, or wait for the PMForecast cron task to run.

## Status changes

Status changes affect the PM forecast in the following ways:

- Changing the status of a PM, or any child within a PM hierarchy, deletes the PM forecast.
- Changing the status of an asset or location on the PM record deletes the PM forecast.

## Asset moves

---

Assets are often moved from place to place within an organization. Asset moves affect the PM forecast in the following ways:

- When an asset is moved within its current site, the forecast remains in place, unaffected.
- When an asset is moved to a new site, the forecast is deleted from the original PM. If a master PM exists, a new PM record is created for the asset in its new site. The forecast must be generated for the new PM, manually or by using a cron task.

---

## Work order generation of forecasted PMs

When a preventive maintenance (PM) record becomes due, a work order is generated. If a forecast exists for the preventive maintenance record, it is affected.

PM records that have a forecast in place use the following business logic when a work order is generated. In all cases, when a work order is generated, the forecasted date for that instance of the PM is deleted.

---

## Time-based PMs

- When a time-based PM has its Use Last Work Order's Start Date to Calculate Next Due Date check box selected (set to Yes), the generated work order uses the New Date if one is provided. If no New Date exists, the generated work order uses the forecasted date.
- When a time-based PM has its Use Last Work Order's Start Date to Calculate Next Due Date check box cleared (set to No), the generated work order uses the New Date if one is provided. If no New Date exists, the PM uses standard work order generation business logic.

---

## Meter-based PMs

For meter-based PMs, generated work orders use the New Date if one is provided. If no New Date exists, PMs use standard work order generation business logic.

---

## Combination PMs

Some PMs are both time- and meter-based. When a work order is generated from a PM that is both time-based and meter-based, the rules for time-based PMs apply.

---

## Work order cancellation when a forecast exists

When you cancel a work order for a preventive maintenance (PM) record for which a forecast exists, the cancellation can affect the forecasted dates.

If you cancel the last generated work record on a PM that contains a forecast, the forecast is updated to include the deleted instance. If you cancel any other work record in the forecast (other than the last one), the forecast is not updated.

For example, a PM forecast is created for a PM record that has scheduled dates of January 21, February 21, March 21, and April 21. Three work orders are generated for January, February, and March. The forecast is updated, deleting the January, February, and March dates from the forecast (because actual work records were created). If you cancel the March 21 work record, the forecast is updated to include March 21, and now includes two forecast dates: March 21 and April 21. However, if you then cancel the January 21 work record, no changes are made to the forecast, and only the April 21 forecast date remains.

---

## Callable actions for PM forecasting

Certain actions within the Actions application were created in order to allow you to set up automated processes for PM forecasting.

An action is an event that you want the system to trigger when it encounters records that meet certain conditions. You define the conditions that cause these actions to occur, allowing you to customize your PM forecasting implementation. For example, an asset with meter-based PMs associated with it has fluctuating usage. The asset's Average Meter Units Per Day is constantly changing, and its PM forecasts are rendered inaccurate. You can set the callable actions to automatically delete and regenerate the forecasts. The callable actions for PM forecasting include:

---

## Delete Forecast

Although most forecast deletions are performed automatically after the user is advised, you can also set the Delete Forecast action to be called from an escalation or workflow process.

- Action Name: Delete Forecast
- Type: Application
- Object: PM
- Parameters Required: None

---

## Generate Forecast

Although most PM forecasts can be created by using the PMForecast cron task, you can also set the Generate Forecast action to be called from an escalation or workflow process.

- Action Name: Generate Forecast
- Type: Application
- Object: PM
- Parameters Required: duration (in days) to generate the forecast for. This value must be a positive integer greater than zero.

## Reforecast

---

Although most PMs can be reforecasted by using the PMForecast cron task, you can also set the Reforecast action to be called from an escalation or workflow process.

- Action Name: Reforecast
- Type: Application
- Object: PM
- Parameters Required: None

## Generate Work Orders

---

You can set up the Generate Work Order action to automatically generate work orders that meet certain conditions, rather than frequency criteria. If the action is called from an escalation or workflow process, the forecast uses the work order generation business rules for the creation of work orders.

- Action Name: Generate Workorder
- Type: Application
- Object: PM
- Parameters Required: There are two parameters required for this action, which must be separated by a colon (for example Y:15).
  - Use Frequency Criteria: The first value in the parameter must be Y or N (OR 1 or 0). If you want to use frequency criteria in the work order generation, enter Y (or 1). If you do not want to use frequency criteria, enter N (or 0).
  - Generate work orders for today plus this number of days: The second value in the parameter is the number of days in advance you want to generate work for. This value must be a positive integer greater than, or equal to, zero.

In the example Y:15, work orders are generated for 15 days, using frequency criteria as defined on the PM record. If you only enter the number of days in advance to create the work for (15), the system uses frequency criteria in work order generation by default.

## Generating work orders from preventive maintenance records

---

You can generate work orders from PM records.

## Before you begin

---

The PM status must be ACTIVE, and the asset or location listed on the PM must have a status of OPERATING.

## About this task

---

You use the Generate Work Orders dialog box to accomplish the following tasks:

- generate a single work order from a single top-level PM
- generate a hierarchy of work orders from a top-level PM in a PM hierarchy
- generate a hierarchy of work orders from a PM with a route
- select multiple top-level PMs from which to generate work orders

When you generate work orders from a PM with an associated job plan, default safety and measurement point information is copied to the work orders.

## Procedure

---

1. In the Preventive Maintenance application, select the PM record for which you want to generate one or more work orders. To generate work orders for multiple top-level PM records, first use the List tab to find and select a subset of PM records.
2. Select the Generate Work Orders action.
3. In the Generate Work Orders dialog box, use the following fields to specify which PMs generate work orders:
  - Generate WOs Due Today Plus This Number of Days  
Insert a "slack" time value in days to generate work orders in advance of their due dates. You might add slack time if your site generates work orders by batch (that is, weekly or monthly).
  - Use Frequency Criteria  
By default, this box is selected. When selected, the system evaluates the frequency criteria for the selected set of records to determine which PMs are due to generate work orders. If a PM is part of a hierarchy, it may trigger work order generation from the entire PM hierarchy.  
  
Clear this check box to generate work orders for the top-level PM in the selected set, regardless of their due dates. If a top-level PM is part of a hierarchy, it might trigger work order generation from the entire hierarchy.
  - Run work order generation in the background  
Select this box to suppress the display of the Generating Work Orders notification and the Display Work Orders Generated page.
  - Notification E-mail for Work Order Generation  
Specify the e-mail address of the worker to be notified about the generated work orders.

4. Click OK.

- **Generating work order hierarchies**

You can generate work order hierarchies from PM hierarchies and from PM records that have associated routes.

- **Adding lead time to top-level preventive maintenance records**

Add lead time to a top-level preventive maintenance (PM) record to allow advance time for gathering tools and materials.

- **Adding slack time to preventive maintenance records**

Add slack time to one or more preventive maintenance (PM) records to allow the generation of weekly or monthly batches of work orders.

---

## Generating work order hierarchies

You can generate work order hierarchies from PM hierarchies and from PM records that have associated routes.

---

### About this task

When generating work orders, the system evaluates all PMs in the hierarchy to determine if any are due to generate work orders:

- It first evaluates the top-level PM, and if that PM is due, the PM triggers the PM hierarchy to generate its work order hierarchy.
- If the top-level PM is not due, the system evaluates each child PM in the hierarchy. If it finds a child PM that is due, and the Use this PM to Trigger PM Hierarchy check box is selected on the child PM, the child PM triggers the PM hierarchy to generate its work order hierarchy.
- The system inserts each work order into a work order hierarchy at the same level as the PM that generated it.
- If the system cannot generate work orders for one PM in a hierarchy, it does not generate work orders for any PMs in the hierarchy. For example, if it has a GL account that is not valid, work orders are not generated.

You can apply routes to PM records. When you generate work orders for a PM with an applied route, you generate a work order for the work asset on the PM record, and a work order task for each asset listed on the route.

---

### Procedure

1. In the Preventive Maintenance application, display the top-level PM record for which you want to generate work orders. To generate work orders for multiple top-level PM records, first use the List tab to find and select a subset of PM records.
2. From the Select Action menu, select Generate Work Orders.
3. In the Generate Work Orders dialog box, use the following fields to specify which PMs generate work orders:
  - **Generate WOs Due Today Plus This Number of Days**  
Insert a "slack" time value in days to generate work orders in advance of their due dates. You might insert slack time if your site generates work orders by batch (that is, weekly or monthly).
  - **Use Frequency Criteria**  
By default, this box is selected. When selected, the system evaluates the frequency criteria for the selected set of records to determine which PMs are due to generate work orders. If a PM is part of a hierarchy, it may trigger work order generation from the entire PM hierarchy.  
  
Clear this check box to generate work orders for the top-level PMs of the selected set, regardless of their due dates. If a top-level PM is part of a hierarchy, it can trigger work order generation from the entire hierarchy.
  - **Run work order generation in the background**  
Select this box to suppress the display of the Generating Work Orders notification and the Display Work Orders Generated page.
  - **Notification E-mail for Work Order Generation**  
Specify the e-mail address of the worker to be notified about the generated work orders.

4. Click OK.

---

## Adding lead time to top-level preventive maintenance records

Add lead time to a top-level preventive maintenance (PM) record to allow advance time for gathering tools and materials.

---

### Procedure

1. In the Preventive Maintenance application, select the appropriate top-level PM record.  
Attention: Add lead time only to top-level PMs.
2. On the PM tab, select the Lead Time Active check box.
3. In the Lead Time (Days) field, specify a time value (in days).
4. Select the Generate Work Orders action.  
When you use the Generate Work Order action on a PM in a hierarchy, all PMs in the hierarchy are evaluated. If any PM meets frequency criteria because lead time was applied, it triggers generation of work orders from the entire hierarchy.
5. Click OK to generate the work orders.

---

## Adding slack time to preventive maintenance records

Add slack time to one or more preventive maintenance (PM) records to allow the generation of weekly or monthly batches of work orders.

## Procedure

---

1. In the Preventive Maintenance application, on the List tab, select a set of records that you want to add slack time to.
2. Select the Generate Work Orders action.
3. In the Generate Work Orders window, specify the time value (in days) in the Generate WOs Due Today Plus This Number of Days field.  
For example, if you have a PM due to generate work orders every day, and you specify 10, 11 work orders are generated.
4. Click OK to generate the work orders.

---

## Adding an extended date to a preventive maintenance record

Add an extended date to a preventive maintenance (PM) record to override the typical next due date for generating PM work orders.

### About this task

---

An extended date only applies to the current PM record; it does not apply to other PMs in a PM hierarchy. Extended dates override seasonal dates.

## Procedure

---

1. In the Preventive Maintenance application, select the PM record that you want to add an extended date to.
2. On the Frequency tab, ensure that there is a date in the Estimated Next Due Date field. If you need a value in the Estimated Next Due Date field, specify a value.
3. In the Extended Date field, specify a value.
4. Select the Adjust Next Due Date check box to let the system adjust this date after generating the work order for the PM. Select this check box to add an extended date.  
If the Adjust Next Due Date check box is selected, the calculation of the next due date after a work order is generated from the PM is: Extended Date + Frequency.

If the Adjust Next Due Date check box is cleared, the calculation is: Next Due Date + Frequency.

If the extended date is later than the calculation of the Next Due Date + Frequency, you might disrupt the frequency cycle of the PM. A warning window advises you that using such an extended date might disrupt the frequency cycle and the job plan sequence. Click OK to continue with the extended date that you have entered. Click Cancel to clear the Extended Date field or to enter a different extension date.

---

## Setting meter values on a preventive maintenance record based on the reading at the last work order

Set a meter value from the last work order on a preventive maintenance (PM) record when you create a PM for an asset that has a meter history.

### About this task

---

If you know the meter history for the asset, you can schedule future preventive maintenance work accordingly. If you do not know the meter history for the asset, you can create a starting point from which to schedule the next work order. Changing a meter value on the PM does not change the meter value on the asset record.

## Procedure

---

1. In the Preventive Maintenance application, select the appropriate PM record.
2. Select the Set Reading at Last WO action.
3. In the New Reading field, specify a value.
4. Click OK to set the new meter value on the PM.

### Results

---

The PM record reflects the new meter reading on the Frequency tab.

---

## Setting preventive maintenance counters

If you have the appropriate access, you can reset the preventive maintenance (PM) counter. You might reset the PM counter if you want the PM to use a different job plan than the one that is scheduled to be next.

## Procedure

---

1. In the Preventive Maintenance application, select the PM record whose counter you want to reset.  
Tip: You can view the current job plan sequence by selecting the View Sequence action from the Select Action menu. You can view the current counter setting on the PM tab.
2. Select the Set PM Counter action.
3. In the New PM Counter field, type a value.
4. Click OK to close the window and return to the PM tab.
5. Click Save PM.

## Example: Preventive maintenance counters for a turbine

You have the following job plan sequence on a PM. The Counter value is 3. The next work order generated from the PM uses the job plan associated with sequence 4. You decide to repeat job plan sequence 1 rather than run job sequence 4, so you change the Counter value to 2. The job plan with sequence 1 is implemented next and job sequence 4 is postponed:

Table 1. Example of PM counters for turbine inspections

Job Plan	Description	Sequence
INS-TURB	Inspect turbine	1
INS-TURBCOMP	Inspect turbine components	4
INS-TURBFEEED	Inspect turbine and feeder system	12

## Master PM

Use the Master PM application to manage master preventive maintenance records (PMs) that you use as templates for other PMs.

You can use the Master PM application to accomplish the following tasks:

- Create, modify, and view master PMs.
- Use a master PM to create and update associated PMs.
- Specify a preventive maintenance schedule for a master PM record. The schedule determines how often work orders are generated from associated PMs. The schedule can generate work orders based on elapsed time between work orders, on meter units used, or both.
- Select specific days, months, or seasons to generate work orders from associated PMs.
- Specify the status of all work orders that are generated from associated PMs.
- Assign a sequential list of job plans to a master PM so that you can schedule different levels of maintenance work at intervals that you specify.
- Define when alert messages are generated.
- [Master Preventive Maintenance records](#)  
Master preventive maintenance records (master PMs) are templates that you use for other PMs, called *associated PMs*. Master PMs can be shared across sites and organizations.
- [Working with master Preventive Maintenance](#)  
You can create, modify, and view master PMs. You can also set PM alerts and frequencies.

## Master Preventive Maintenance records

Master preventive maintenance records (master PMs) are templates that you use for other PMs, called *associated PMs*. Master PMs can be shared across sites and organizations.

A master PM does not generate work orders like other PMs. Instead, it is used to generate associated PMs. Associated PMs are managed in the Preventive Maintenance application. You can create associated PM records from master PM records, or make associations between PM records and a master PM. You can use the scheduling information about a master PM record to update its associated PM records.

Master PMs can contain job plan information, as well as information about active seasons for associated PMs. When you create a master PM, you determine how associated PMs schedule work for the assets. You can create schedules based on the following conditions:

- Elapsed time since the target start date or completion date of previous work. PMs for this work are called time-based PMs.
- Metered equipment usage since the target start date or completion date of previous work. PMs for this work are called meter-based PMs.
- A combination of elapsed time and metered usage. For example, you can schedule a PM to trigger work every six months or every 300 hours, whichever comes first.

You can create flexible schedules for PMs by using lead times, seasonal and extended dates, and by triggering work outside of a PM frequency cycle.

- [Master PM frequency schedules](#)  
You specify a frequency schedule for a master preventive maintenance (PM) record to determine how often work orders are generated from associated PMs.
- [Extended dates](#)  
An extended date overrides a preventive maintenance (PM) record's typical next due date for generating PM work orders. This date only applies to the current PM record; it does not apply to other PMs in a PM hierarchy.
- [Seasonal Preventive maintenance](#)  
A seasonal preventive maintenance (PM) record is a PM (or master PM) record that you can activate and deactivate to accommodate work that you do only during certain seasons.
- [Job plans on master preventive maintenance](#)  
A job plan is a detailed description of work that you perform on an asset. You associate a job plan with a master PM to create work plans.
- [Preventive maintenance alerts](#)  
A preventive maintenance (PM) alert is a list of almost-due PM records. It indicates that a preventive maintenance work order is about to become due for an

asset or a location.

---

## Master PM frequency schedules

You specify a frequency schedule for a master preventive maintenance (PM) record to determine how often work orders are generated from associated PMs.

One or more of the following conditions typically trigger preventive maintenance work:

- Elapsed time since previous work. Such PMs are called time-based PMs.
- Metered usage of equipment. Such PMs are called meter-based PMs.
- A combination of elapsed time and metered usage. For example, you can schedule a PM to trigger work every six months or every 300 hours, whichever comes first.

You enter scheduling information about the Frequency tab in the Master PM application.

You can work with more complex schedules by using lead times, seasonal and extended dates, and by triggering work outside of a PM frequency cycle.

---

## Fixed schedules and floating schedules

To schedule any master or associated PM, determine whether you want to work on a fixed schedule or a floating schedule. On a fixed schedule, you plan work based on the target start date of the previous work. The target start increments by a frequency that you specify. On a fixed schedule, you can create multiple work orders in advance. On a floating schedule, you plan work based on the closure of the previous work. You cannot generate a new work order until the current one is completed on a floating schedule.

- When you create a fixed-schedule PM, the PM work is scheduled based on the value in the Last Start Date field on each associated PM. The Last Start Date field is on the PM tab of the Preventive Maintenance application.
- When you create a floating-schedule PM, the PM work is scheduled based on the value in the Last Completion Date field. The Last Completion Date field is on the PM tab of the Preventive Maintenance application.

---

## Extended dates

An extended date overrides a preventive maintenance (PM) record's typical next due date for generating PM work orders. This date only applies to the current PM record; it does not apply to other PMs in a PM hierarchy.

The Extended Date and related fields are on the Frequency tab in the Preventive Maintenance and Master PM applications.

Things to know about extended dates:

- An extended date overrides seasonal dates of a PM.
- If an extended date is used on a parent PM in a hierarchy and one child PM is due to generate a work order earlier than the extension date, the entire PM hierarchy generates work orders earlier than the extension date. After the work orders are generated, all extended dates in the hierarchy are cleared.
- After you generate work orders from the PM, the system clears the values in the Extended Date field and the Adjust Next Due Date check box.
- You can choose whether the extended date affects subsequent due dates for a PM:  
If the Adjust Next Due Date check box is selected, the calculation of the next due date after a work order is generated from the PM is: Extended Date + Frequency.

If the Adjust Next Due Date check box is cleared, the calculation is: Next Due Date + Frequency.

If the extended date is later than the calculation of the Next Due Date + Frequency, you can disrupt the frequency cycle of the PM. A warning window advises you that using such an extended date can disrupt the frequency cycle and job plan sequence of the PM.

---

## Seasonal Preventive maintenance

A seasonal preventive maintenance (PM) record is a PM (or master PM) record that you can activate and deactivate to accommodate work that you do only during certain seasons.

You can have multiple active seasons (seasons where work orders are generated) for a single PM. You can also determine on which days of the week a PM is active.

For example, you want PMs for a particular asset to generate work orders only during the summer and winter months. You define two active seasons for this PM, using the Seasonal Dates tab. Also, your company is closed on weekends. You do not want work orders generated on weekend days so you specify that work orders that become due on those days are scheduled for Monday instead.

---

## Job plans on master preventive maintenance

A job plan is a detailed description of work that you perform on an asset. You associate a job plan with a master PM to create work plans.

When a master preventive maintenance (PM) record has a job plan associated with it, the job plan becomes a work plan on any work order the system generates from the associated PMs. The work order contains tasks for each operation in the work plan. You can modify the tasks on a work order without affecting the original

job plan.

You can assign one or more job plans to a master PM. If you assign more than one job plan, you must specify how often that plan is used by assigning a sequence number to it.

If a job plan has a default safety plan when used with the selected work asset, the system copies the safety plan to the work order.

- **Sequence numbers for master PM job plans**

You can assign one or more job plans to a master PM. If you assign more than one job plan to a master PM, sequence numbers determine how often a plan is used.

---

## Sequence numbers for master PM job plans

You can assign one or more job plans to a master PM. If you assign more than one job plan to a master PM, sequence numbers determine how often a plan is used.

For example, you can assign monthly, quarterly, and yearly job plans for work on an asset. The monthly job might be several simple maintenance tasks, while the quarterly and yearly jobs might be more complex.

You could add a sequence of three job plans to specify different inspections of a turbine:

- A monthly basic inspection of a turbine
- A quarterly inspection of its components
- A yearly inspection of the turbine and its feeder system

By assigning a sequence number to each job plan, you specify which job plan is selected each time a work order is generated from the associated PM records.

---

## How job plans are selected

When you generate a work order from a PM, the system first increments the value in the Counter field by one, then selects the job plan. The system selects the job plan with the highest sequence number that divides evenly into the value in the Counter field. If no sequence number meets this criterion, the primary job plan (sequence number 1) is used. The value in the Sequence field means that this job plan would be used on every *n*th work order generated from the PM, where *n* is the sequence number.

---

## Example: Job plan sequence for a turbine

For the turbine inspections, you would create a job plan sequence as follows:

Table 1. Example of a job plan sequence for turbine inspections

Job Plan	Description	Sequence	Meaning
INS-TURB	Inspect turbine	1	This job plan is the default or primary job plan. It is used unless the sequence calls for a different plan. This job plan is used when the value in the Counter field is divisible only by one.
INS-TURBCOMP	Inspect turbine components	3	This job plan is used when three is the highest number that divides evenly into the value of the Counter field.
INS-TURBFEEED	Inspect turbine and feeder system	12	This job plan is used when 12 is the highest number that divides evenly into the value of the Counter field.

---

## Preventive maintenance alerts

A preventive maintenance (PM) alert is a list of almost-due PM records. It indicates that a preventive maintenance work order is about to become due for an asset or a location.

If the following criteria are met, the system displays the PM Alert window:

- The PM alert functionality was enabled in the PM Options window in the Organizations application. This includes indicating a work order status at which PM alerts are enabled.
- The corrective maintenance work order reaches the status defined in the Organizations application.

The frequency criteria for the PM are defined as follows:

Table 1. Frequency criteria for PMs

For:	a PM alert is generated if:
time-based PMs	the Next Due Date minus the Alert Lead is less than or equal to the system date.
meter-based PMs on an asset:	the Next Meter Reading minus the Meter Reading, minus the Alert Lead is less than or equal to zero.
meter-based PMs on a location:	the Next Meter Reading minus the Meter Reading, minus the Alert Lead is less than or equal to zero.

---

## Working with master Preventive Maintenance

You can create, modify, and view master PMs. You can also set PM alerts and frequencies.

- [Creating master preventive maintenance](#)  
Create a master preventive maintenance (PM) record to create associated PMs and maintain scheduling information for associated PMs.
- [Updating associated preventive maintenance](#)  
You can modify schedules and job plans on a master PM and apply the changes to all the associated PMs.

---

## Creating master preventive maintenance

Create a master preventive maintenance (PM) record to create associated PMs and maintain scheduling information for associated PMs.

### Procedure

---

1. In the Master PM application, on the toolbar, click New Master PM. If the Master PM field is empty, enter a value.
  2. Enter a description field. Click Long Description if you need more space.
  3. If you are creating associated PMs for assets and locations that have rotating items, enter the identifier in the Item field.
  4. If you want to create associated PMs for the location of an item, select the Create Associated PMs for Item's Location check box. If you want to create associated PMs for the asset of an item, select the Create Associated PMs for Item's Asset check box.  
If you do not select the check boxes, you will not see the asset or location associated with that item in the Create Associated PMs window.
  5. Fill in the remaining required fields, along with other fields as appropriate.
  6. On the Frequency tab, define the frequency with which you want the associated PMs to generate work orders. The master PM frequency can be time-based, meter-based, or both.
    - For time-based master PMs, define the frequency criteria. Select the Update Time Based Information in Existing PMs check box if you want to update the following fields every time you update this master PM's associated PMs: Frequency, Frequency Units, and Alert Lead.
    - For meter-based master PMs, define the frequency criteria. Select the Update Meter Based Information in Existing PMs check box if you want to update the following fields when you update the associated PMs: Frequency, Alert Lead, and Generate WO Ahead By.  
Attention: If an associated PM has a different frequency than its master PM, updating the associated PM overwrites the frequency data. Any changes made to the associated PM are lost during the update. To keep the frequency data on the associated PM, select the Override Updates from Master PM check box in the associated PM record.
  7. If the master PM is a seasonal PM, enter the days, dates, or both that you want the associated PMs to be active on the Seasonal Dates tab. Select the Update Existing PMs Seasonal Dates check box if you want to update seasonal information on associated PMs when you select the Update Associated PMs action. Any changes that you made to the seasonal dates of an associated PM are lost during an update.
  8. On the Job Plan Sequence tab, enter job plan data for the master PM. Select the Update Job Plan Sequence in Existing PMs check box if you want to update job plan data on associated PMs when you select the Update Associated PMs action. Any changes that you made to job plan data on an associated PM are lost during an update.
  9. Save the record.
- [Creating associated PMs from a master PM](#)  
Create associated preventive maintenance records (PMs) from a master PM to schedule preventive maintenance work and to generate PM work orders for a rotating item's asset, location, or both.
  - [Specifying the status of associated PM work orders](#)  
On a master preventive maintenance (PM) record, you can specify the status of all work orders that the system generates from the associated PMs.
  - [Setting the frequency of master PMs](#)  
You specify a frequency schedule for a master preventive maintenance (PM) record to determine how often work orders are generated from associated PMs.
  - [Specifying the generation of work orders before their due dates](#)  
Lead time is an amount of time that is added to the system date when determining if an associated preventive maintenance (PM) record will generate a work order. When you specify lead time on a master PM record, work orders from the associated PMs are generated in advance of their next due dates.
  - [Defining when work orders are generated](#)  
You can specify on which days of the week a master preventive maintenance (PM) record is active. Work orders are generated from associated PMs only on the specified active days.
  - [Defining seasonal dates for work order generation](#)  
You can specify the active months or seasons of a master preventive maintenance (PM) record. The associated PMs of a seasonal PM only generate work orders during those periods that you specify.

---

## Creating associated PMs from a master PM

Create associated preventive maintenance records (PMs) from a master PM to schedule preventive maintenance work and to generate PM work orders for a rotating item's asset, location, or both.

### Procedure

---

1. Open the Master PM application, on the Master PM tab, display the master PM from which you want to create associated PMs.
2. Check that there is a value in the Item field. This item must be a rotating item associated with the asset, location, or both for which you want to create PMs.
3. Select either or both of the following check boxes, as appropriate:
  - Create Associated PMs for Item's Location
  - Create Associated PMs for Item's Asset
4. Select the Create Associated PMs action.
5. In the Create Associated PMs window, select the check boxes of the assets, locations, or both for which you want to create PMs. The list includes asset and location identifiers of the rotating item shown in the Item field on the master PM.  
If you have already created associated PMs for an asset or location, the list does not include those assets or locations.
6. Click OK to create the associated PMs. The system assigns identifiers to the PMs and displays a confirmation window, listing the new associated PM records.
7. Click Close to close the confirmation window.

---

## Specifying the status of associated PM work orders

On a master preventive maintenance (PM) record, you can specify the status of all work orders that the system generates from the associated PMs.

### Procedure

---

1. On the Master PM tab of the Master PM application, display the master PM record.
2. In the Work Order Status field, specify a value.  
If the item on the PM belongs to an item set, then the Select Value list contains only those statuses that are available in all organizations that share that item set.
3. Save the record.

---

## Setting the frequency of master PMs

You specify a frequency schedule for a master preventive maintenance (PM) record to determine how often work orders are generated from associated PMs.

- [Defining frequency for time-based master PMs](#)  
Specify frequency for a time-based master preventive maintenance (PM) record to determine how often its associated PMs generate work orders.
- [Defining frequency for meter-based master PMs](#)  
Specify frequency for a meter-based master preventive maintenance (PM) record to determine how often its associated PMs generate work orders.
- [Defining the alert lead time for master PMs](#)  
You can define the lead time for master preventive maintenance (PM) alert messages so that alerts display before work orders are generated.
- [Overriding the next due date for associated PMs](#)  
You can add an extended date to a master preventive maintenance (PM) record. An extended date overrides the next due date on an associated PM record.

---

## Defining frequency for time-based master PMs

Specify frequency for a time-based master preventive maintenance (PM) record to determine how often its associated PMs generate work orders.

### About this task

---

For time-based PMs, the generation criteria is based on elapsed time since the target start date or completion date of previous work.

### Procedure

---

1. In the Master PM application, display the master PM record that you want to define frequency for.
2. Click the Frequency tab.
3. To specify the type of schedule that you want to use for associated PMs, choose either of the following options:
  - To create a fixed schedule PM, select the Use Last Work Order's Start Date to Calculate Next Due Date check box.
  - To create a floating schedule PM, clear the Use Last Work Order's Start Date to Calculate Next Due Date check box.
4. On the Time Based Frequency subtab, determine how much time you want to elapse between generating work orders from the associated PMs. Enter or select the appropriate information in the Frequency and Frequency Units fields.
5. In the Next Due Date (used during PM create only) field, specify a value.  
The value in the Next Due Date field is the first date on which the associated PMs generate work orders.
6. Optional: Update time-based frequency information about the associated PMs by selecting the Update Time Based Information in Existing PMs check box.  
When you update associated PMs, the time-based information is copied to the associated PM records.
7. Save the record.

---

## Defining frequency for meter-based master PMs

Specify frequency for a meter-based master preventive maintenance (PM) record to determine how often its associated PMs generate work orders.

### About this task

---

For meter-based PMs, the generation criteria is based on metered equipment usage since the target start date or completion date of previous work.

### Procedure

---

1. In the Master PM application, display the master PM you want to define frequency for.
2. Click the Frequency tab.
3. Select one of the following options to specify whether you want associated PMs to be on a fixed or floating schedule:
  - To use a fixed schedule, select the Use Last Work Order's Start Date to Calculate Next Due Date check box.
  - To use a floating schedule, clear the Use Last Work Order's Start Date to Calculate Next Due Date check box.

4. On the Meter Based Frequency subtab, click New Row.
5. In the Meter field, specify a value based on how much metered activity you want to occur between PM work orders for this asset.  
You can only select continuous-type meters.
6. Optional: In the Frequency and First Start Reading fields, specify values.  
The value in the First Start Reading field is the first meter reading at which the associated PMs generate work orders.
7. Optional: Enter multiple meter frequency criteria by repeating steps 4 through 6.
8. Optional: Update meter-based frequency information about the associated PMs by selecting the Update Meter Based Information in Existing PMs check box.  
When you update associated PMs, the meter-based information is copied to the associated PM records.
9. Save the record.

---

## Defining the alert lead time for master PMs

You can define the lead time for master preventive maintenance (PM) alert messages so that alerts display before work orders are generated.

---

### Procedure

1. In the Master PM application, display the master PM record that you want to define alert lead time for.
2. Click the Frequency tab.
  - For time-based master PMs, on the Time Based Frequency subtab, specify the alert lead time, in days, in the Alert Lead (Days) field.
  - For meter-based master PMs, click the Meter Based Frequency subtab, then click the detail menu to display the meter information. (If no meter was previously defined, define one now by clicking New Row. In the Alert Lead field, specify the alert lead, in meter frequency units.
3. Save the record.

---

## Overriding the next due date for associated PMs

You can add an extended date to a master preventive maintenance (PM) record. An extended date overrides the next due date on an associated PM record.

---

### About this task

When you update associated PMs, the extended date is copied to all associated PMs, which affects the next time they generate PM work orders. The extended date only applies to the associated PM record; it does not apply to other PMs that are further down in a PM hierarchy. Extended dates override seasonal dates.

---

### Procedure

1. In the Master PM application, display the record you want to add an extended date to.
2. Click the Frequency tab.
3. Check that there is a date in the Next Due Date (Used During PM Create Only) field. If you need a value in the Next Due Date (Used During PM Create Only) field, select a date.
4. In the Extended Date field, specify a date.  
The date must be later than the next due date.
5. Select the Adjust Next Due Date check box to let the system adjust this date after generating a work order for an associated PM.  
You must have an extended date defined to select this check box.  
If the Adjust Next Due Date check box is selected, the calculation of the next due date after a work order is generated from the PM is: Extended Date + Frequency.

If the Adjust Next Due Date check box is cleared, the calculation is: Next Due Date + Frequency.

If the extended date is later than the calculation of the Next Due Date + Frequency, you can disrupt the frequency cycle of the associated PM. A warning window advises you that using such an extended date might disrupt the frequency cycle and job plan sequence of the PM. Click OK to continue with the extended date you have entered. Click Cancel to clear the Extended Date field or to enter a different extension date.

---

## Specifying the generation of work orders before their due dates

Lead time is an amount of time that is added to the system date when determining if an associated preventive maintenance (PM) record will generate a work order. When you specify lead time on a master PM record, work orders from the associated PMs are generated in advance of their next due dates.

---

### Procedure

1. In the Master PM application, display the master PM record that you want to apply lead time to.
2. On the Master PM tab, select the Lead Time Active check box.
3. Enter a time value (in days) in the Lead Time (Days) field.
4. Save the record.

---

### Example

For example, you have a master PM that specifies that on the 15th of each month, a work order is to be performed. You want an extra day each month to gather the tools required for the job. You set the lead time on the master PM to one day. The system generates work orders from the associated PMs one day earlier than it would have otherwise, that is, on the 14th.

---

## Defining when work orders are generated

You can specify on which days of the week a master preventive maintenance (PM) record is active. Work orders are generated from associated PMs only on the specified active days.

---

### Procedure

1. In the Master PM application, display the master PM record that you want to define active days for.
2. Click the Seasonal Dates tab.
3. In the Active Days section, select the check boxes for each day that you want the associated PMs to generate work orders. To keep the associated PMs from generating work orders on a certain day, clear the check box for that day.
4. Save the record.

---

## Defining seasonal dates for work order generation

You can specify the active months or seasons of a master preventive maintenance (PM) record. The associated PMs of a seasonal PM only generate work orders during those periods that you specify.

---

### About this task

A master PM can have multiple active seasons.

---

### Procedure

1. In the Master PM application, display the master PM record that you want to define active dates for.
2. Click the Seasonal Dates tab.
3. In the Active Dates section, click New Row.
4. Specify the start month and start day, and the end month and end day for the active season of the master PM.
5. To define multiple active seasons, repeat steps 3 and 4.
6. Optional: Update the seasonal dates on the associated PM records by selecting the Update Existing PMs Seasonal Dates check box.  
When you update associated PMs, the seasonal dates are copied to the associated PM records.
7. Save the record.

---

## Updating associated preventive maintenance

You can modify schedules and job plans on a master PM and apply the changes to all the associated PMs.

---

### About this task

In the Preventive Maintenance application, if an associated PM has the Override Updates from Master PM check box selected, the master PM does not affect its schedule.

---

### Procedure

1. In the Master PM application, display the master PM whose associated PMs you want to update.
2. On the Frequency tab, change the master scheduling information about the PM.
3. Review the information in the Work Order Generation Information area.  
The fields correspond to information that the master PM updates on the associated PMs.
4. Optional: Select the Update Existing PMs check box to update the Extended Date field of the associated PMs.
5. On the Time Based Frequency and Meter Based Frequency subtabs of the Frequency tab, ensure that the following check boxes are selected to update the appropriate frequency information:
  - For time-based master PMs, ensure that the Update Time Based Information in Existing PMs check box is selected. The Frequency, Frequency Units, and Alert Lead (Days) fields on the associated PMs are updated when you update associated PMs.
  - For meter-based master PMs, ensure that the Update Meter Based Information in Existing PMs check box is selected. The Frequency, Alert Lead, and Generate WO Ahead By fields are updated on the associated PMs when you update associated PMs.
6. On the Seasonal Dates tab, change the active days, dates, or both. To update seasonal dates on the associated PMs, select the Update Existing PMs Seasonal Dates check box.
7. On the Job Plan Sequence tab, change the job plan information. To update job plan sequences on the associated PMs, select the Update Job Plan Sequence in Existing PMs check box.
8. Save the master PM.
9. Select the Update Associated PMs action.

10. Select the check box for each site that you want to update associated PMs.
11. Click OK.

---

## Purchasing module

You use the applications in the Purchasing module to manage the purchasing process, including obtaining requests for quotations (RFQs), purchasing the materials and services, and then receiving and invoicing them. The applications also help you to maintain information about the companies from which you purchase, and to integrate legal terms and conditions into the purchasing process.

- **[Purchase Requisitions](#)**  
You use the Purchase Requisitions application to create purchase requisitions for items, for supplies, or for services. You can also use this application to create purchase orders from purchase requisitions.
- **[Purchase Orders](#)**  
You use the Purchase Orders application to create purchase orders and to change existing purchase orders. You can create purchase orders and reuse the data and vendor information while applying consistent terms and contracts.
- **[Receiving](#)**  
In a large enterprise, you can have a centralized purchasing department for several sites. Each site receives its own materials and services. You use the Receiving application to receive materials and services. You use this application to record materials and services to the database when they are delivered to a site. You can also return materials to vendors.
- **[Shipment Receiving](#)**  
In a large organization, you can transfer inventory items or tools between storerooms within the same site or across sites and organizations and track their delivery. You create shipment receipt records to acknowledge the receipt of transferred items and update inventory balances at the destination storeroom.
- **[Invoices](#)**  
You use the Invoices application to record vendor invoices as you receive them. You can also record debit and credit notes from vendors, and match invoice details against purchase orders and receipts. You can reverse approved or paid invoices, credit memos, or debit memos. Items that are part of the consignment inventory can be invoiced when the items are used.
- **[Request for Quotations](#)**  
You use the Request for Quotations application to create requests for quotations and to store the quotations. Based on the quotations, you can assess the vendor who best meets your needs.
- **[Companies](#)**  
The Companies application maintains detailed information about vendors, manufacturers, and other companies.
- **[Company Master](#)**  
You use the Company Master application to create company master records that belong to a particular company set. You can also use the Company Master application to associate a company master record with an organization.
- **[Terms and Conditions](#)**  
You use the Terms and Conditions application to specify and to maintain a library of terms and conditions. You can add the terms and conditions to a purchasing document or to a contract. Terms can contain information such as liability concerns, shipping and handling details, and delivery time expectations.

---

## Purchase Requisitions

You use the Purchase Requisitions application to create purchase requisitions for items, for supplies, or for services. You can also use this application to create purchase orders from purchase requisitions.

When you have records that are associated with purchase requisitions, such as contracts and requests for quotations, you can view these records. You can obtain a comprehensive look at all of the data that is related to purchase requisitions.

- **[Purchase requisitions overview](#)**  
A purchase requisition (PR) is a written request issued internally to a purchasing department to order items or services. The creation of a purchase requisition sets off a chain reaction of activities as outlined in the purchasing process.
- **[Working with purchase requisitions](#)**  
When you create a purchase requisition (PR), you can add line items from inventory, materials, tools, services, or standard services to a purchase requisition (PR). When you associate items such as terms and conditions, contracts, conversion factors, or units of measure with a PR, you can ensure consistency from your vendors.

---

## Purchase requisitions overview

A purchase requisition (PR) is a written request issued internally to a purchasing department to order items or services. The creation of a purchase requisition sets off a chain reaction of activities as outlined in the purchasing process.

You can create the following types of purchase requisitions:

- Internal purchase requisitions: requesting the transfer of materials from another company storeroom.
- External purchase requisitions: requesting the purchase of the necessary materials from an outside vendor. You can specify the vendor.
- **[Purchasing process](#)**  
The steps in the purchasing process include creating purchase requisitions, creating purchase orders, receiving services and items, and recording vendor invoices.
- **[Purchase record attributes](#)**  
Attributes are used to categorize items. For example, the purchasing record for a computer can have the attributes of memory, disk space, and speed. When

you create a purchase order, you can use the Classifications feature to search for items based on attributes.

- **[Purchase requisition statuses](#)**

Once a purchase requisition has been created, you use the purchase requisition status to indicate where it is in the processing cycle.

- **[Tax-exempt status](#)**

The tax-exempt option indicates whether an item, a tool, or a service is taxable. You might want to set the tax-exempt status, depending on where an item or a service is acquired, and how an item or a service is used.

- **[Terms and conditions](#)**

You can create and maintain a library of terms and conditions that your company and your vendors must follow on purchase order and contract transactions. Terms and conditions can contain information such as: liability concerns, shipping and handling details, and delivery time expectations.

- **[Currency conversions](#)**

When you specify a foreign currency on a purchase requisition or purchase order, two values are calculated: the total cost that is expressed in the foreign currency, and the total base cost that is expressed in the base currency or your company currency.

---

## Purchasing process

The steps in the purchasing process include creating purchase requisitions, creating purchase orders, receiving services and items, and recording vendor invoices.

The following example illustrates the purchasing process from requisitioning through invoicing.

---

### Step 1: Create the purchase requisition

You can create and approve a purchase requisition 98074 for the following services and related materials:

- Two contract programmers (1,000 hours each)
- Two personal computers
- A software package
- Rental furniture (desks, chairs)

---

### Step 2: Create the purchase orders

You can create the following purchase orders, one for each vendor by using the Copy PR Line Items to PO action in the Purchase Orders application:

- Purchase order 98105 that contains two contract programmers (1,000 hours each)
- Purchase order 98106 that contains two personal computers
- Purchase order 98107 that contains a software package
- Purchase order 98108 that contains rental furniture (desks, chairs)

---

### Step 3: Receive the services and items

When you record receipts from each vendor, you must use the appropriate receipts tab in the Receiving application and the Select Ordered Services and Select Ordered Items actions.

---

### Step 4: Record vendor invoices

After you purchase materials and services, your company receives bills, or invoices, from the vendors. You use the Invoices application to record vendor invoices as you receive them. When you create invoice records you can list purchase order details on the invoice when it is appropriate.

You use the Copy PO Lines action to copy lines from either the receipts or the purchase order to the Invoice Lines tab. You can also view lines that are not on the invoice for items or services received, and add the lines to the invoice.

---

## Purchase record attributes

Attributes are used to categorize items. For example, the purchasing record for a computer can have the attributes of memory, disk space, and speed. When you create a purchase order, you can use the Classifications feature to search for items based on attributes.

Attributes are set up in the Classifications application and are then associated with individual items in the Item Master application. When you view a purchasing record, you can see any attributed associated with the line item on the Specifications tab.

When you add line items to a purchase order, you can search for items by attribute. If your inventory has many types of similar items, using Classifications can help you locate the exact type of item that you want to add.

---

## Purchase requisition statuses

Once a purchase requisition has been created, you use the purchase requisition status to indicate where it is in the processing cycle.

Changing statuses on purchase requisitions affects both field functionality and access to various action pages. You can change the status of multiple purchase requisitions at the same time by using the List tab.

Purchase requisitions can have the following statuses:

**Waiting for Approval (WAPPR)**

WAPPR is the status that a purchase requisition is assigned when it is created. Some default fields are read-only.

**Approved (APPR)**

APPR status is available only if your business rules require approvals. The default configuration does not require approvals for purchase requisitions and purchase requisition line items that your transfer to purchase requisitions. You must have a monetary approval limit equal to or greater than the total cost of the purchase order. Your system administrator sets approval limits for each user.

**Closed (CLOSE)**

CLOSE status indicates that all the purchase requisitions line items have been assigned to one or more purchase orders. All fields are read only, and the record can no longer be modified. If you try to close a purchase requisition and a line item has not yet been assigned, a message is displayed. Your system administrator can set the system to automatically close purchase requisitions once you transfer all the line items to purchase orders, requests for quotations, or contracts.

**Canceled (CAN)**

CAN status is available if the current purchase requisition status is Approved (APPR) and if none of its line items have been assigned to a purchase order. All fields are read only, and a record can no longer be modified.

---

## Tax-exempt status

The tax-exempt option indicates whether an item, a tool, or a service is taxable. You might want to set the tax-exempt status, depending on where an item or a service is acquired, and how an item or a service is used.

The situations under which items or services are tax-exempt vary depending upon your location, and upon current tax regulations. For example, the storeroom for an item might be in a location where sales taxes are not collected. In some cases, if an item becomes part of a product, that item can be tax-exempt. If the item is used as a stand-alone item, then the item is taxable. The buyer for your organization determines the tax-exempt status of items, of tools, and of services.

You can override the tax-exempt status for items, for tools, and for services in the following applications:

- Purchase Requisitions
- Purchase Orders
- Invoices

When you specify the tax-exempt status, you can apply the status at the organization level and at the vendor level.

---

## Terms and conditions

You can create and maintain a library of terms and conditions that your company and your vendors must follow on purchase order and contract transactions. Terms and conditions can contain information such as: liability concerns, shipping and handling details, and delivery time expectations.

You can create a library of term and condition values in the Terms and Conditions application. You use the library to look up and associate terms and conditions to purchase order and contract records. The library is accessible in the Purchase Orders and contracts applications.

You can set default term and condition values according to site and contract type in the Organizations application. When you create a contract record in a contracts application, it inherits the default term and condition values that you assigned to the selected contract type in the Organizations application.

---

## Currency conversions

When you specify a foreign currency on a purchase requisition or purchase order, two values are calculated: the total cost that is expressed in the foreign currency, and the total base cost that is expressed in the base currency or your company currency.

---

### Example of currency conversion

Your base currency is US\$ (US dollar). You enter a purchase requisition for gaskets to be ordered from a French company. On the PR tab, select **EUR** (Euro) in the Currency field. On the PR Lines tab you enter 25 in the Quantity field, and 3.14 in the Unit Cost field. Using the active exchange rate of 1.17726 for the **EUR**, two values are calculated and displayed on the PR tab:

- Total Cost:  $(25 \times 3.14 \text{ Euro}) = 78.50 \text{ Euro}$
- Total Base Cost:  $(78.50 \text{ Euro} \times 1.17726 \text{ exchange rate}) = 92.41 \text{ US dollars}$

---

## Working with purchase requisitions

When you create a purchase requisition (PR), you can add line items from inventory, materials, tools, services, or standard services to a purchase requisition (PR). When you associate items such as terms and conditions, contracts, conversion factors, or units of measure with a PR, you can ensure consistency from your vendors.

- [Records related to purchase requisitions](#)

If you have records that are associated with purchase requisitions, such as invoices, contracts, and requests for quotations, you can view these records. You

- can obtain a comprehensive look at all of the data that are related to purchase requisitions.
- [Changing the status of a list of records](#)  
You can change the status of multiple records in applications.
- [Creating purchase requisitions](#)  
You create purchase requisitions to identify items or services you need.
- [Creating purchase orders from purchase requisitions](#)  
You can create a purchase order from within a purchase requisition record.
- [Referencing contracts on purchase requisitions](#)  
You can reference a contract on a purchase requisition to benefit from pre-arranged pricing with a specific vendor.
- [Creating, associating, and modifying terms](#)  
You can create terms and conditions for records and you can associate existing terms with records. You can also modify how the sequence of terms displays for a record .
- [Distributing purchasing line item costs](#)  
You can distribute the costs of a purchase order or desktop requisition line item across multiple GL accounts. For example, if your department ordered and received a new laser printer that the packaging department is also to use, you can specify two GL accounts for the printer, one for each department.

---

## Records related to purchase requisitions

If you have records that are associated with purchase requisitions, such as invoices, contracts, and requests for quotations, you can view these records. You can obtain a comprehensive look at all of the data that are related to purchase requisitions.

To see all of the records related to a particular purchase requisition, select the View Related Records action.

To view the transactions and the records that are specific to a purchase requisition line, click the View Related Records icon at the end of the purchase requisition line. In the View Related Records window, you can click the identifier for an invoice, a purchase order, a contract, and a request for quotation to access that record in the relevant application.

---

## Changing the status of a list of records

You can change the status of multiple records in applications.

---

### Procedure

1. In the Work Order application, on the List tab of an application, filter the records so that less than 200 records are displayed.
2. Scroll down the bottom of the screen and select the Select Records check box.  
The screen refreshes and each row now has a check box.
3. Select the check boxes for the work orders whose status you want to change.
4. Click the Change Status action and enter the information in the dialog box.
5. Click OK to close the Change Status window.

---

## Creating purchase requisitions

You create purchase requisitions to identify items or services you need.

---

### About this task

You can create two types of purchase requisitions:

- Internal purchase requisitions requesting the transfer of materials from another company storeroom
- External purchase requisitions requesting the purchase of the necessary materials from an outside vendor

After the purchase requisition is approved, the line items can be placed on one or more purchase orders and sent to the appropriate vendors. You can also create purchase requisitions from the Inventory application using the Reorder Items action, which you specify in the Purchasing options in the Organizations application.

---

### Procedure

1. From the toolbar of the Purchase Requisitions application, click New Purchase Requisition.
2. Optional: Modify the value in the PR field.
3. In the Description field, type a description.
4. Fill the remaining required fields.
5. Click the PR Lines tab and add lines to the purchase requisition.
6. Click the Ship To/Bill To tab. Ship-to information defaults from the Person record, as defined in the People application. If there is no default ship-to information associated with the Person record, the product copies the ship-to information from your organization.
7. In the Ship To field, type a value or click Select Value to choose from the list. Fill the remaining Ship To information.
8. In the Bill To field, type a value or click Select Value to choose from the list. Fill the remaining Bill To information.
9. Click Save Purchase Requisition.

- [Adding lines to purchase requisitions](#)  
You use the Purchase Requisitions application to add lines to purchase requisitions.
- [Viewing contract items](#)  
When adding lines to purchase requisitions, you can view a list of the items under contract with a specified vendor.

---

## Adding lines to purchase requisitions

You use the Purchase Requisitions application to add lines to purchase requisitions.

### Before you begin

---

The purchase requisition must be approved before you can assign its line items to one or more purchase requisitions. The status of the purchase requisition must be WAPPR (Waiting for approval). A purchase requisition can be closed when all its line items have been assigned to a purchase requisition.

### About this task

---

You can add a purchase requisitions line for any of the following:

- Item from inventory
- Material not from inventory
- Tool
- Service
- Standard service
- Special order (if your administrator makes this option available).

### Procedure

---

1. In the Purchase Requisitions application, create or display a purchase requisition.
2. Click the PR Lines tab. In the PR Lines table window, click New Row.
3. Fill the remaining required fields:
  - For the Item or Tool line types, if an item is not associated with a unit price, you must enter information in the following fields:
    - Quantity
    - Unit Cost
    - Specify information for one of the following fields:
      - Storeroom
      - Work Order
      - Location
      - Asset
      - GL Debit Account
  - For the Material line types, specify information for the following fields:
    - Description
    - Quantity
    - Unit Cost
    - Specify information for one of the following fields:
      - Work Order
      - Location
      - Asset
      - GL Debit Account - If your organization requires general ledger account validation for transactions, this field must be populated before the approval of the purchase requisition.
  - For the Service line types, specify information for the following fields:
    - Description
    - Quantity
    - Unit Cost or Line Cost
    - Specify information for one of the following fields:
      - Work Order
      - Location
      - Asset
      - GL Debit Account - If your organization requires general ledger account validation for transactions, this field must be populated before the approval of the purchase requisition.
  - For the Standard Service line types, specify information for the following fields:
    - Item
    - Quantity
    - Unit Cost or Line Cost
    - Specify information for one of the following fields:
      - Work Order
      - Location
      - Asset
      - GL Debit Account - If your organization requires general ledger account validation for transactions, this field must be populated before the approval of the purchase requisition.
4. Enter or modify other purchase requisition line information as needed.
5. Optional: Choose one of the following options:

Option	Description
--------	-------------

Option	Description
<b>Vendor Items</b>	You can choose from a list of items associated with this vendor.
<b>Contract Items</b>	You can choose from a list of items that appear on contracts with this vendor.
<b>Select Spare Parts</b>	You can choose from a list of spare parts for a particular asset.
<b>Vendor Analysis</b>	You can view vendor history, such as past performance.
<b>View Contracts</b>	You can view all contracts associated with that item.
<b>Distribute Costs</b>	You can distribute the cost of the line item to multiple general ledger debit accounts.
<b>New Row</b>	You can add another line to the purchase requisition.

6. Click Save Purchase Requisition.

- **Creating units of measure**

You can create a unit of measure to describe the quantity used to measure an item, tool, or a service. You use a unit of measure to measure the items and services that you order, issue, and transfer in the asset management system. Examples of units of measure include EACH, CASE, IN (inches), and ROLL.

- **Creating conversion factors**

You can create a conversion factor to define the numeric value or ratio that the asset management system uses to relate one unit of measure to another. The conversion factor is an alternate value that is used to represent a unit of measure. You can use this alternate value to define an item order or transfer quantity and storeroom balance.

## Creating units of measure

You can create a unit of measure to describe the quantity used to measure an item, tool, or a service. You use a unit of measure to measure the items and services that you order, issue, and transfer in the asset management system. Examples of units of measure include EACH, CASE, IN (inches), and ROLL.

### About this task

A unit of measure works with a conversion factor. The conversion factor represents the numeric value or ratio that the asset management system uses to relate one unit of measure to another. You can create units of measure and conversion factors in many applications:

- Assets
- Purchase Orders
- Purchase Requisitions
- Receiving
- Item Master
- Meters
- Service Items
- Tools
- Stocked Tools
- Inventory

You can delete a unit of measure only when it is not used in a conversion, on a specification template, or on a meter record.

### Procedure

1. Open an application.
2. Select the Unit of Measure and Conversion > Add/Modify Units of Measure action.
3. Insert a row.
4. In the Unit of Measure field, specify an identifier for the unit of measure.
5. Optional: Enter values in the following fields:
  - Abbreviation
  - Description

The abbreviation value along with an asset classification is used to create descriptions for assets, locations, and items.
6. Click OK.

## Creating conversion factors

You can create a conversion factor to define the numeric value or ratio that the asset management system uses to relate one unit of measure to another. The conversion factor is an alternate value that is used to represent a unit of measure. You can use this alternate value to define an item order or transfer quantity and storeroom balance.

### Before you begin

You must define the units of measure before you can create conversion ratios.

### About this task

You can create units of measure and conversion factors in the following applications:

- Purchase Orders

- Purchase Requisitions
- Receiving
- Item Master
- Service Items
- Tools
- Stocked Tools
- Inventory

## Procedure

1. Open an application.
2. Select the Unit of Measure and Conversion > Add/Modify Conversions action.
3. Click New Row.
4. Enter values in the following fields:

Option	Description
<b>From Unit of Measure</b>	The original unit of measure value that you are converting from in the conversion factor calculation.
<b>To Unit of Measure</b>	The unit of measure value that you are changing or replacing in the conversion factor calculation.
<b>Conversion Factor</b>	The ratio that is applied to relate one unit of measure to another.

5. Optional: In the Item Number field, enter the item number that is associated to the conversion.
6. Click OK.

## Viewing contract items

When adding lines to purchase requisitions, you can view a list of the items under contract with a specified vendor.

### Before you begin

A purchase requisition record must have a vendor defined in order to be able to view contract items.

### About this task

Depending on the settings of the referenced contract, you might be able to change the quantity or price of the contract item on the purchase requisition line. On the referenced contract, if the Change Quantity on Use or the Change Price on Use check boxes are selected, you can change the quantity or price or both on the purchase requisition line. If the check boxes are cleared on the referenced contract record, you cannot change the quantity or price.

## Procedure

1. From the Purchase Requisitions application, display a purchase requisition record.
2. Click the PR Lines tab and click Contract Items.
3. In the Contract Items window, select the check box next to the contract items you want to copy to the purchase requisition.  
You can filter the contract items by entering values in any of the fields in the first row of the table and clicking Filter Table.
4. Click OK to copy the items onto the PR Lines tab, including information about contract references and pricing in the purchase requisition line details.
5. Click Save Purchase Requisition.

## Creating purchase orders from purchase requisitions

You can create a purchase order from within a purchase requisition record.

### Before you begin

The purchase requisition must have at least one line item that has not been assigned to a purchase order. You must have authorization from your system administrator to use the Create PO action.

### About this task

Your system administrator might require that purchase requisitions be approved before you can assign line items to purchase orders. If so and the current purchase requisition is not approved, the product displays an error message. Your system administrator might also specify that the status of the purchase requisition is changed to Closed when all line items have been assigned to purchase orders. If so, the purchase requisition becomes a history record and cannot be modified after all line items are assigned to a purchase order.

## Procedure

1. From the Purchase Requisitions application, display the purchase requisition that you want to convert to a purchase order.
2. Select the Create PO action.
3. In the PO field, type a purchase order number or click Autonumber to generate a number automatically.
4. Optional: Edit the Description field.

5. Fill the required fields.
6. Click OK.

All unassigned line items that have not been flagged as Copy to RFQ or Copy to Contract for this purchase requisition are copied to the purchase order.

---

## Referencing contracts on purchase requisitions

You can reference a contract on a purchase requisition to benefit from pre-arranged pricing with a specific vendor.

### About this task

---

You can reference a contract on a purchase requisition in multiple ways:

- Reference a contract on the purchase requisition header.
- Reference a contract when there is a vendor.
- Reference a contract when there is not a vendor.

### Procedure

---

1. In the Purchase Requisitions application, click New Purchase Requisition.
2. Depending on how you want to reference a contract, do one of the following:
  - To reference a contract on the purchase requisition header:
    - In the Contract Reference field, type a value or click Select Value to choose one from the list.
    - Click the PR Lines tab and click Contract Items to select from items that are listed on the referenced contract.
    - Enter or modify information as needed.
  - To reference a contract on a purchase requisition when there a vendor is specified:
    - In the Company field, type the name of the vendor. Enter or modify other information as needed.
    - Click the PR Lines tab. In the PR Lines table window, click New Row.
    - Do one of the following:
      - Click Contract Items to select from items that are listed on the referenced contract.
      - In the Item field, specify a value or click Detail Menu to choose an option. After you select an item, the product checks to see if there is a contract for this vendor/item combination. If so, several fields on the PR Lines table window are populated.
    - Type or modify other information as needed.
  - To reference a contract on a purchase requisition when there is not a vendor specified:
    - In the Company field, type the name of the vendor.
    - Enter or modify other information as needed.
    - Click the PR Lines tab. In the PR Lines table window, click New Row.
    - In the Item field, type a value or click Detail Menu to choose an option. After you select an item, the product checks to see if there is a contract for this vendor/item combination. If so, several fields on the PR Lines table window are populated.
    - If multiple contracts are available for this item, click View Contracts in the PR Lines table window. Select a contract from the View Contracts window.
    - Type or modify other information as needed.
3. Click Save Purchase Requisition.

---

## Creating, associating, and modifying terms

You can create terms and conditions for records and you can associate existing terms with records. You can also modify how the sequence of terms displays for a record .

- **[Creating terms](#)**  
You can create terms and conditions that can later be associated with a contract or purchasing record. Terms and conditions can contain information such as: liability concerns, shipping and handling details, and delivery time expectations.
- **[Associating existing terms with records](#)**  
You can associate terms and conditions with records to define the rules that your company and your vendors must follow on purchase order and contract transactions.
- **[Modifying the sequence of terms for records](#)**  
You can change the order in which the terms for a record display. You can modify the sequence to display a more logical order, or to list certain terms sequentially.
- **[Creating terms](#)**  
You can create terms and conditions that can later be associated with a contract or purchasing record. Terms and conditions can contain information such as: liability concerns, shipping and handling details, and delivery time expectations.
- **[Associating existing terms with records](#)**  
You can associate terms and conditions with records to define the rules that your company and your vendors must follow on purchase order and contract transactions.
- **[Modifying the sequence of terms for records](#)**  
You can change the order in which the terms for a record display. You can modify the sequence to display a more logical order, or to list certain terms sequentially.

---

## Creating terms

You can create terms and conditions that can later be associated with a contract or purchasing record. Terms and conditions can contain information such as: liability concerns, shipping and handling details, and delivery time expectations.

## Before you begin

---

Terms and conditions can only be added to purchasing or contracts records set at statuses in progress or waiting on approval.

## Procedure

---

1. In a purchasing or contract application, display the record for which you want to create a term.
2. On the Terms and Conditions tab, click New Row.
3. Specify the sequence and term.
4. Optional: Select the Send to Vendor check box.
5. Save the record.

## What to do next

---

You can set default term and condition values according to site and contract type in the Organizations application. When you create a contract record in a contracts application, the contract inherits the default term and condition values that you assigned to the selected contract type in the Organizations application.

## Associating existing terms with records

---

You can associate terms and conditions with records to define the rules that your company and your vendors must follow on purchase order and contract transactions.

## About this task

---

The Terms and Conditions application maintains a library of terms and conditions with which you and your vendors must comply. You can select terms from this library to apply to contract and purchasing records.

## Procedure

---

1. In a purchasing or contract application, display the record for which you want to select a term.
2. On the Terms and Conditions tab, click Select Terms.
3. Select the Select Record check box next to each term that you want to associate with the record.
4. Click OK.
5. Optional: Select the term in the Terms and Conditions table window and select the Send to Vendor check box.
6. Save the record.

## Modifying the sequence of terms for records

---

You can change the order in which the terms for a record display. You can modify the sequence to display a more logical order, or to list certain terms sequentially.

## Procedure

---

1. In the appropriate Purchasing or Contract application, display the record with which you want to associate a term.
2. Click the Terms and Conditions tab.
3. In the Terms and Conditions table window, locate the rows for which you want to change the sequence.
4. In the Sequence column for the appropriate rows, specify a value. You can enter any integer up to 9999. The product defaults the sequence numbers to multiples of 10. You can rearrange the order without renumbering the entire sequence.
5. Click Save.

## Distributing purchasing line item costs

---

You can distribute the costs of a purchase order or desktop requisition line item across multiple GL accounts. For example, if your department ordered and received a new laser printer that the packaging department is also to use, you can specify two GL accounts for the printer, one for each department.

## Before you begin

---

If you want to distribute line item costs, the purchasing and desktop requisition records must meet the following conditions:

- The line item is a direct issue item or service
- None of the items have been received
- The service line is not prorated

## Procedure

---

1. In a purchasing or the Desktop Requisitions application, display the direct issue record that you want to update.
2. In the line item table window, click New Row.
3. Enter values in the following fields:
  - Item
  - Line Cost
4. Enter a value in one of the following fields:
  - Work Order
  - WO Task ID
  - Location
  - Asset
  - GL Debit Account
5. Click Distribute Costs.
6. Click New Row.
7. Enter values in the following fields:
  - Percentage
  - Line Cost
  - GL Debit Account

If you enter a percentage, the line cost representing that percentage is displayed. If you enter a portion of the line cost, the percentage for that cost is displayed. The first row in the Distribute Costs table displays the percentage and the total line cost of the line item that you entered. You must edit this row to be able to distribute costs for the line item.

8. Continue to enter rows until one of the following conditions is met:
  - The sum of the percentage fields is equal to a value of 100%
  - The sum of the loaded cost fields are equal the total unit cost of the current line item
9. Click OK.
10. Click Save record.

---

## Purchase Orders

You use the Purchase Orders application to create purchase orders and to change existing purchase orders. You can create purchase orders and reuse the data and vendor information while applying consistent terms and contracts.

You can also use this application to generate internal purchase orders from a storeroom. A storeroom-to-storeroom purchase order is like a transfer order or an internal purchase order. You use the Purchase Orders application and the Inventory Usage application to track the internal movement of items.

When you have records that are associated with purchase orders, such as invoices, contracts, and requests for quotations, you can view these records. You can obtain a comprehensive look at all of the data that is related to purchase orders.

You can also view the transactions and the records that are specific to a purchase order line.

- [Purchase orders overview](#)  
A purchase order is an authorized order from a purchasing agent or department to an internal supplier or external vendor. The purchase order lists items or services.
- [Working with purchase orders](#)  
You can create purchase orders that reuse data and vendors and apply consistent terms and contracts. You can create purchase orders from purchase requisitions, material requests, and requests for quotations.

---

## Purchase orders overview

A purchase order is an authorized order from a purchasing agent or department to an internal supplier or external vendor. The purchase order lists items or services.

You can create purchase orders using any of the following methods:

- From the Purchase Orders application
- From the Purchase Requisition (PR) application
- From a Request for Quotation (RFQ) in the Request for Quotations application
- From the Inventory application using the inventory reorder actions
- From the Purchase Contracts application by creating a release
- [Purchasing process](#)  
The steps in the purchasing process include creating purchase requisitions, creating purchase orders, receiving services and items, and recording vendor invoices.
- [Purchase order statuses](#)  
You can change the status of purchase orders. Changing the status of purchase orders can impact access to actions, and whether you can modify field values.
- [Approval of purchase orders](#)  
To approve a purchase order, a monetary approval limit must be set that is equal to or greater than the total cost of the purchase order. Your system administrator sets monetary limits for each user, and can specify that purchase requisitions be approved before any of their items can be assigned to purchase orders.

- **Purchase record attributes**  
Attributes are used to categorize items. For example, the purchasing record for a computer can have the attributes of memory, disk space, and speed. When you create a purchase order, you can use the Classifications feature to search for items based on attributes.
- **Conditions for the distribution of costs on purchase orders**  
You can distribute the cost of a purchase order line item among several general ledger accounts. For example, two departments in your organization are purchasing ten items, and you want the cost to be shared by the two departments.
- **Attachments to purchase orders**  
You can attach documents to purchase orders from different applications. You can also attach documents that you created, and documents
- **Revision of purchase orders**  
You revise purchase orders when you want to change information, such as the quantity or the vendor, on a purchase order.
- **Vendor analysis data**  
You can determine which vendor to use for an item. Information about vendors is calculated from the past performance of the vendor for the selected item. When you review vendor analysis data, you can select a primary vendor for an item. You can also choose the storerooms that use the primary vendor when ordering an item.
- **Tax-exempt status**  
The tax-exempt option indicates whether an item, a tool, or a service is taxable. You might want to set the tax-exempt status, depending on where an item or a service is acquired, and how an item or a service is used.
- **Terms and conditions**  
You can create and maintain a library of terms and conditions that your company and your vendors must follow on purchase order and contract transactions. Terms and conditions can contain information such as: liability concerns, shipping and handling details, and delivery time expectations.
- **Currency conversions**  
When you specify a foreign currency on a purchase requisition or purchase order, two values are calculated: the total cost that is expressed in the foreign currency, and the total base cost that is expressed in the base currency or your company currency.

## Purchasing process

The steps in the purchasing process include creating purchase requisitions, creating purchase orders, receiving services and items, and recording vendor invoices.

The following example illustrates the purchasing process from requisitioning through invoicing.

### Step 1: Create the purchase requisition

You can create and approve a purchase requisition 98074 for the following services and related materials:

- Two contract programmers (1,000 hours each)
- Two personal computers
- A software package
- Rental furniture (desks, chairs)

### Step 2: Create the purchase orders

You can create the following purchase orders, one for each vendor by using the Copy PR Line Items to PO action in the Purchase Orders application:

- Purchase order 98105 that contains two contract programmers (1,000 hours each)
- Purchase order 98106 that contains two personal computers
- Purchase order 98107 that contains a software package
- Purchase order 98108 that contains rental furniture (desks, chairs)

### Step 3: Receive the services and items

When you record receipts from each vendor, you must use the appropriate receipts tab in the Receiving application and the Select Ordered Services and Select Ordered Items actions.

### Step 4: Record vendor invoices

After you purchase materials and services, your company receives bills, or invoices, from the vendors. You use the Invoices application to record vendor invoices as you receive them. When you create invoice records you can list purchase order details on the invoice when it is appropriate.

You use the Copy PO Lines action to copy lines from either the receipts or the purchase order to the Invoice Lines tab. You can also view lines that are not on the invoice for items or services received, and add the lines to the invoice.

## Purchase order statuses

You can change the status of purchase orders. Changing the status of purchase orders can impact access to actions, and whether you can modify field values.

Status	Description
Approved (APPR)	Available only if the current purchase order status is Waiting for Approval (WAPPR), In Progress (INPRG), or Pending Revision (PNDREV).

Status	Description
Canceled (CAN)	Available if the purchase order status is Waiting for Approval (WAPPR), Approved (APPR), In Progress (INPRG), or Pending Revision (PNDREV). A Cancel PO transaction is sent to the supplier upon cancellation of a purchase order. An approved purchase order cannot be canceled if any of the following conditions exist: <ul style="list-style-type: none"> <li>One or more purchase order line items were received.</li> <li>The supplier sent notification of delivery of items using an ASN transaction.</li> <li>The supplier rejected the purchase order cancellation.</li> <li>There is a pending revision for the purchase order.</li> </ul>
Closed (CLOSE)	Indicates that all of the line items for a purchase order were received. After a purchase order is closed, it is stored as a history record that cannot be modified. The Closed (CLOSE) status is not available if the purchase order is in Pending Revision (PNDREV) status.
Hold (HOLD)	Indicates that a purchase order is being revised, and the associated receipts and invoices are not to be processed. The HOLD status remains until the revision to the purchase order is approved.
In Progress (INPRG)	Indicates that a purchase order is being created and is not ready for approval.
Pending Revision (PNDREV)	Indicates that a purchase order is being revised. A purchase order can be revised only if the status of the purchase order is Approved (APPR) or In Progress (INPRG). The PNDREV status is automatically assigned to a purchase order that is being revised. You can have one revision of a purchase order in PNDREV status at a time. If the cost and tax adjustments option is enabled, the unit cost, the line cost, and the tax cost for purchase order line items can be modified. The purchase order must be in PNDREV status.
Revised (REVISED)	Indicates that a purchase order was revised. When a purchase order is approved, the status of the previous version of the purchase order is set to Revised (REVISED). The previous version becomes a history record that cannot be changed.
Waiting for Approval (WAPPR)	The default status for a purchase order when you create it. Some default fields are read-only in this status.

## Approval of purchase orders

To approve a purchase order, a monetary approval limit must be set that is equal to or greater than the total cost of the purchase order. Your system administrator sets monetary limits for each user, and can specify that purchase requisitions be approved before any of their items can be assigned to purchase orders.

Your system administrator can specify bypassing the validation of revisions to contracts that are associated with purchase orders. If the system administrator sets this option, purchase orders can be approved by any person in that group. If the Bypass Contract Revision on PO Approval check box does not show on the PO tab of the Purchase Orders application, contact your system administrator.

After a purchase order is approved, most of the fields cannot be edited. You can create a revision of the purchase order and edit the fields in the revision.

## Purchase record attributes

Attributes are used to categorize items. For example, the purchasing record for a computer can have the attributes of memory, disk space, and speed. When you create a purchase order, you can use the Classifications feature to search for items based on attributes.

Attributes are set up in the Classifications application and are then associated with individual items in the Item Master application. When you view a purchasing record, you can see any attributed associated with the line item on the Specifications tab.

When you add line items to a purchase order, you can search for items by attribute. If your inventory has many types of similar items, using Classifications can help you locate the exact type of item that you want to add.

## Conditions for the distribution of costs on purchase orders

You can distribute the cost of a purchase order line item among several general ledger accounts. For example, two departments in your organization are purchasing ten items, and you want the cost to be shared by the two departments.

A purchase order line item must meet the following conditions if you want to distribute its costs:

- The purchase order line item must be a direct issue item or service.
- None of the items or services for the purchase order were received.
- The type for the purchase order must be either REL (Release) or STD (Standard).
- The status of the purchase order must be WAPPR (Waiting for Approval).
- None of the service lines for the purchase order are prorated.

## Attachments to purchase orders

You can attach documents to purchase orders from different applications. You can also attach documents that you created, and documents

You can attach documents to purchase orders from the following applications:

#### Companies

Attach documents to suppliers on a purchase order.

#### Purchase Orders

Attach documents to purchase order header information.

#### Inventory

Attach documents to items on a purchase order.

#### Purchase Requisitions

Attach documents to the requisition lines on a purchase order.

## Revision of purchase orders

You revise purchase orders when you want to change information, such as the quantity or the vendor, on a purchase order.

A purchase order must be in a status of Approved (APPR) or In Progress (INPRG) before it can be revised. You select the Revise PO action to create a revision of the purchase order. Each time that you create a purchase order, a revision number is generated, starting with 0. When you revise a purchase order, the purchase order number does not change. You can make numerous changes to the same purchase order. Changes that are made to a purchase order affect future transactions only. The changes do not apply to existing receipt lines or to existing invoice lines. You cannot revise internal purchase orders.

## Vendor analysis data

You can determine which vendor to use for an item. Information about vendors is calculated from the past performance of the vendor for the selected item. When you review vendor analysis data, you can select a primary vendor for an item. You can also choose the storerooms that use the primary vendor when ordering an item.

The following table provides a description of the values in the fields. All values are for a selected item, for a selected vendor, and where the manufacturer, model number, and catalog numbers are the same.

Field	Data calculation
Promised Lead Time (Days)	The promised delivery time (lead time) for this item from the vendor.
Last Delivery Time	The amount of elapsed time, in days, between the purchase order date and the date of receipt for the most recent order of this item and vendor combination.
Average Delivery Time	The average amount of elapsed time between the order dates and the dates of receipt. This value is calculated by dividing the total of all the delivery times by the total number of purchase order lines for this item and vendor combination.
Percent on Time	The percentage of receipts, where the date of receipt was on or before the delivery date for the vendor. This value is calculated by dividing the number of on-time receipts by the total number of receipts for this item and vendor combination.
Total # of Complete POs	The number of completed purchase orders where item, vendor, manufacturer, model number, and catalog number match this record.
Quantity Received	The total number of order units received for this item and vendor combination.
Quantity Received YTD	The total number of order units received since the beginning of the current calendar year for this item and vendor combination.
Quantity Rejected	The total number of order units rejected for this item and vendor combination.
Quantity Rejected YTD	The total number of order units rejected since the beginning of the current calendar year for this item and vendor combination.
Percent Rejected	The percentage of order units rejected for this item and vendor combination. This value is calculated by dividing the amount rejected by the total of all received and rejected order units for this item and vendor combination.
Percent Rejected YTD	The percentage of order units rejected since the beginning of the current calendar year for this item and vendor combination. This value is calculated by dividing the amount rejected by the total of all received and rejected order units for this item and vendor combination since the beginning of the calendar year.

## Tax-exempt status

The tax-exempt option indicates whether an item, a tool, or a service is taxable. You might want to set the tax-exempt status, depending on where an item or a service is acquired, and how an item or a service is used.

The situations under which items or services are tax-exempt vary depending upon your location, and upon current tax regulations. For example, the storeroom for an item might be in a location where sales taxes are not collected. In some cases, if an item becomes part of a product, that item can be tax-exempt. If the item is used as a stand-alone item, then the item is taxable. The buyer for your organization determines the tax-exempt status of items, of tools, and of services.

You can override the tax-exempt status for items, for tools, and for services in the following applications:

- Purchase Requisitions
- Purchase Orders
- Invoices

When you specify the tax-exempt status, you can apply the status at the organization level and at the vendor level.

---

## Terms and conditions

You can create and maintain a library of terms and conditions that your company and your vendors must follow on purchase order and contract transactions. Terms and conditions can contain information such as: liability concerns, shipping and handling details, and delivery time expectations.

You can create a library of term and condition values in the Terms and Conditions application. You use the library to look up and associate terms and conditions to purchase order and contract records. The library is accessible in the Purchase Orders and contracts applications.

You can set default term and condition values according to site and contract type in the Organizations application. When you create a contract record in a contracts application, it inherits the default term and condition values that you assigned to the selected contract type in the Organizations application.

---

## Currency conversions

When you specify a foreign currency on a purchase requisition or purchase order, two values are calculated: the total cost that is expressed in the foreign currency, and the total base cost that is expressed in the base currency or your company currency.

---

### Example of currency conversion

Your base currency is US\$ (US dollar). You enter a purchase requisition for gaskets to be ordered from a French company. On the PR tab, select **EUR** (Euro) in the Currency field. On the PR Lines tab you enter 25 in the Quantity field, and 3.14 in the Unit Cost field. Using the active exchange rate of 1.17726 for the EUR, two values are calculated and displayed on the PR tab:

- Total Cost:  $(25 \times 3.14 \text{ Euro}) = 78.50 \text{ Euro}$
- Total Base Cost:  $(78.50 \text{ Euro} \times 1.17726 \text{ exchange rate}) = 92.41 \text{ US dollars}$

---

## Working with purchase orders

You can create purchase orders that reuse data and vendors and apply consistent terms and contracts. You can create purchase orders from purchase requisitions, material requests, and requests for quotations.

- [Creating purchase orders](#)  
You can create purchase orders and reuse the data and vendor information while applying consistent terms and contracts. You can combine multiple purchase requisitions for the same vendor on a single purchase order.
- [Creating units of measure](#)  
You can create a unit of measure to describe the quantity used to measure an item, tool, or a service. You use a unit of measure to measure the items and services that you order, issue, and transfer in the asset management system. Examples of units of measure include EACH, CASE, IN (inches), and ROLL.
- [Creating conversion factors](#)  
You can create a conversion factor to define the numeric value or ratio that the asset management system uses to relate one unit of measure to another. The conversion factor is an alternate value that is used to represent a unit of measure. You can use this alternate value to define an item order or transfer quantity and storeroom balance.
- [Creating commodity groups](#)  
You can create a commodity group to identify a grouping of items, tools, or services. A commodity group contains a grouping of individual commodity codes. Classifying items, tools, services with commodity groups and commodity codes provides a way for you to analyze spending by product type. You first define a commodity group and then add and associate individual commodity codes to the group.
- [Creating contracts from purchasing records](#)  
You can use the Create Contract action to create a contract from a purchase order, purchase requisition, request for quotation, or an invoice. You can create contracts based on the information contained on records in the purchasing module applications.
- [Creating, associating, and modifying terms](#)  
You can create terms and conditions for records and you can associate existing terms with records. You can also modify how the sequence of terms displays for a record.

---

## Creating purchase orders

You can create purchase orders and reuse the data and vendor information while applying consistent terms and contracts. You can combine multiple purchase requisitions for the same vendor on a single purchase order.

---

### Procedure

1. In the Purchase Orders application, click New Purchase Order.
2. Specify a description of your purchase order and fill the required fields.
3. On the PO Lines tab, click New Row to add line items to the purchase order.
4. On the Ship To/Bill To tab, provide the shipping information.
5. In the Bill To field, specify a value, and provide the billing information.

6. Click Save Purchase Order.

## What to do next

---

To print a purchase order you must create a request page. Go to the Reports Administration application and click the Generate Request Pages button.

- [Adding lines to purchase orders](#)  
You can add lines to an existing purchase order for each item, material, service, or tool to be purchased.
- [Adding contract items to purchase orders](#)  
When adding lines to purchase orders, you can add items that are under contract with a specified vendor.
- [Distributing purchasing line item costs](#)  
You can distribute the costs of a purchase order or desktop requisition line item across multiple GL accounts. For example, if your department ordered and received a new laser printer that the packaging department is also to use, you can specify two GL accounts for the printer, one for each department.
- [Specifying delivery of materials to storerooms](#)  
After you create a purchase order, you can specify that the materials be sent to an inventory storeroom.
- [Specifying delivery of materials to work locations](#)  
After you create a purchase order, you can specify that the materials be sent to a work location. A direct issue item is an item that is sent directly to a work location.
- [Completing receipts](#)  
You can manually complete the receipts on a line to complete a purchase order. You perform this action when all lines are not received and no further receipts are expected.

---

## Adding lines to purchase orders

You can add lines to an existing purchase order for each item, material, service, or tool to be purchased.

### Before you begin

---

The status of the purchase order must be either Waiting for Approval (WAPPR) or Pending Revision (PNDREV).

### About this task

---

The first time that you create an item or a service in the Item Master application, you can specify the percentage of items or services that can be received over the amount that is ordered in the initial agreement. The percentage value is applied to the organization level and to the vendor level for an item or a service.

When you add lines to a purchase order, you can modify the percentage of items or services that can be received over the amount that is ordered in the initial agreement. You can also choose to specify either a quantity or an amount, instead of a percentage.

### Procedure

---

1. In the Purchase Orders application, display a purchase order.
2. Click the PO Lines tab.
3. In the PO Lines table, click New Row.
4. Fill the remaining required fields.  
**Tip:** If you are entering a series of items with similar information, fill one or more of the fields in the Default Table Data section.
5. Optional: Specify or modify other purchase order line information as needed.
6. Save the purchase order.

---

## Adding contract items to purchase orders

When adding lines to purchase orders, you can add items that are under contract with a specified vendor.

### Before you begin

---

You must specify a vendor on the purchase order.

### About this task

---

You might be able to change the quantity or the price of the contract item on the purchase order line, depending on the settings of the referenced contract. If, on the referenced contract, the Change Quantity on Use or the Change Price on Use check boxes are selected, you can change the quantity or the price on the purchase order line. If the check boxes are cleared on the referenced contract record, you cannot change the quantity or the price.

### Procedure

---

1. In the Purchase Orders application, display the purchase order record to which you want to add contract items.
2. Click the PO Lines tab.

3. Click Contract Items.
4. In the Contract Items window, select the check box next to the contract items that you want to copy to the purchase order. You can filter the contract items by specifying values in any of the fields in the first row of the table and by clicking Filter.
5. Click OK.

---

## Distributing purchasing line item costs

You can distribute the costs of a purchase order or desktop requisition line item across multiple GL accounts. For example, if your department ordered and received a new laser printer that the packaging department is also to use, you can specify two GL accounts for the printer, one for each department.

### Before you begin

---

If you want to distribute line item costs, the purchasing and desktop requisition records must meet the following conditions:

- The line item is a direct issue item or service
- None of the items have been received
- The service line is not prorated

### Procedure

---

1. In a purchasing or the Desktop Requisitions application, display the direct issue record that you want to update.
2. In the line item table window, click New Row.
3. Enter values in the following fields:
  - Item
  - Line Cost
4. Enter a value in one of the following fields:
  - Work Order
  - WO Task ID
  - Location
  - Asset
  - GL Debit Account

5. Click Distribute Costs.

6. Click New Row.

7. Enter values in the following fields:
  - Percentage
  - Line Cost
  - GL Debit Account

If you enter a percentage, the line cost representing that percentage is displayed. If you enter a portion of the line cost, the percentage for that cost is displayed. The first row in the Distribute Costs table displays the percentage and the total line cost of the line item that you entered. You must edit this row to be able to distribute costs for the line item.

8. Continue to enter rows until one of the following conditions is met:
  - The sum of the percentage fields is equal to a value of 100%
  - The sum of the loaded cost fields are equal the total unit cost of the current line item
9. Click OK.
10. Click Save record.

---

## Specifying delivery of materials to storerooms

After you create a purchase order, you can specify that the materials be sent to an inventory storeroom.

### Procedure

---

1. In the Purchase Orders application, display the purchase order for which you want to specify delivery of materials to a storeroom.
2. Click the PO Lines tab.
3. In the Item field, and in the Storeroom field, specify values. If an item does not exist in the storeroom, you can add a storeroom by typing a valid storeroom value in the Storeroom field. The inventory record is created when the item is received.
4. In the PO Lines table window, click New Row.
5. Optional: Specify other values as needed.
6. Click Save Purchase Order.

---

## Specifying delivery of materials to work locations

After you create a purchase order, you can specify that the materials be sent to a work location. A direct issue item is an item that is sent directly to a work location.

### Procedure

---

1. In the Purchase Orders application, display the purchase order for which you want to specify delivery of materials to work locations.
2. Click the PO Lines tab.
3. In the Item field, specify a value.
4. In the PO Lines window, click New Row.
5. In the Work Order field, the Asset field, or the Location field, specify a value. The Issue on Receipt check box is selected, and the Storeroom field becomes null and read-only.
6. Optional: Specify other values as needed.
7. Click Save Purchase Order.

---

## Completing receipts

You can manually complete the receipts on a line to complete a purchase order. You perform this action when all lines are not received and no further receipts are expected.

### Before you begin

---

You must have authorization to use the Complete Receipts window. The Complete Receipts option does not display if you are not authorized to use it.

### About this task

---

You cannot close a purchase order until you receive all the line items on a purchase order.

### Procedure

---

1. In the Purchase Orders application, display the purchase order record for which you want to complete receipts.
2. Click the PO Lines tab.
3. Select the Complete Receipts action.
4. In the Complete Receipts window, select the check boxes for the rows for which you want to complete receipts.
5. Click OK.  
On the PO Lines tab, the Receipts Complete check box for each line with complete receipts is selected. If all lines have complete receipts, the Receipts field on the PO tab reads COMPLETE.

---

## Creating units of measure

You can create a unit of measure to describe the quantity used to measure an item, tool, or a service. You use a unit of measure to measure the items and services that you order, issue, and transfer in the asset management system. Examples of units of measure include EACH, CASE, IN (inches), and ROLL.

### About this task

---

A unit of measure works with a conversion factor. The conversion factor represents the numeric value or ratio that the asset management system uses to relate one unit of measure to another. You can create units of measure and conversion factors in many applications:

- Assets
- Purchase Orders
- Purchase Requisitions
- Receiving
- Item Master
- Meters
- Service Items
- Tools
- Stocked Tools
- Inventory

You can delete a unit of measure only when it is not used in a conversion, on a specification template, or on a meter record.

### Procedure

---

1. Open an application.
2. Select the Unit of Measure and Conversion > Add/Modify Units of Measure action.
3. Insert a row.
4. In the Unit of Measure field, specify an identifier for the unit of measure.
5. Optional: Enter values in the following fields:
  - Abbreviation
  - DescriptionThe abbreviation value along with an asset classification is used to create descriptions for assets, locations, and items.
6. Click OK.

---

## Creating conversion factors

You can create a conversion factor to define the numeric value or ratio that the asset management system uses to relate one unit of measure to another. The conversion factor is an alternate value that is used to represent a unit of measure. You can use this alternate value to define an item order or transfer quantity and storeroom balance.

### Before you begin

---

You must define the units of measure before you can create conversion ratios.

### About this task

---

You can create units of measure and conversion factors in the following applications:

- Purchase Orders
- Purchase Requisitions
- Receiving
- Item Master
- Service Items
- Tools
- Stocked Tools
- Inventory

### Procedure

---

1. Open an application.
2. Select the Unit of Measure and Conversion > Add/Modify Conversions action.
3. Click New Row.
4. Enter values in the following fields:

Option	Description
From Unit of Measure	The original unit of measure value that you are converting from in the conversion factor calculation.
To Unit of Measure	The unit of measure value that you are changing or replacing in the conversion factor calculation.
Conversion Factor	The ratio that is applied to relate one unit of measure to another.

5. Optional: In the Item Number field, enter the item number that is associated to the conversion.
6. Click OK.

---

## Creating commodity groups

You can create a commodity group to identify a grouping of items, tools, or services. A commodity group contains a grouping of individual commodity codes. Classifying items, tools, services with commodity groups and commodity codes provides a way for you to analyze spending by product type. You first define a commodity group and then add and associate individual commodity codes to the group.

### About this task

---

Once you have defined commodities you can associate them with company, contract, and item records. You can also associate commodities with individual purchase order or requisition lines for items, service items, or tools that do not have commodity codes assigned to them, including special order materials or services.

You can create commodity groups and codes in the following asset management system applications:

- Companies
- Item Master
- Purchase Orders
- Service Items
- Tools

### Procedure

---

1. Open an application.
2. Select the Add/Modify Commodity Codes action.
3. In the Commodity Groups table window, click New Row.
4. In the Commodity Group field, enter an identifier for the commodity group.
5. Specify whether you want a service type item or service level agreement to use this commodity group.

Option	Service
Use commodity group	Selected
Do not use commodity group	Cleared

6. In the Commodity Codes for Commodity Group table window, click New Row.
7. In the Commodity Code field, enter an identifier for the commodity.

8. Specify whether you want a service type item or service level agreement to use this commodity code.

Option	Service
Use commodity code	Selected
Do not use commodity code	Cleared

9. Click OK.

---

## Creating contracts from purchasing records

You can use the Create Contract action to create a contract from a purchase order, purchase requisition, request for quotation, or an invoice. You can create contracts based on the information contained on records in the purchasing module applications.

### Procedure

---

1. In a purchasing application, display the record from which you want to create a contract.
2. Select the Create Contract action.
3. In the Contract field, enter an identifier for the contract.
4. In the Contract Type field, enter a value to identify the type of contract that you want to create.
5. Click OK.

### Results

---

The asset management system creates a contract record that you can now access in a contracts application.

---

## Creating, associating, and modifying terms

You can create terms and conditions for records and you can associate existing terms with records. You can also modify how the sequence of terms displays for a record .

- [Creating terms](#)  
You can create terms and conditions that can later be associated with a contract or purchasing record. Terms and conditions can contain information such as: liability concerns, shipping and handling details, and delivery time expectations.
- [Associating existing terms with records](#)  
You can associate terms and conditions with records to define the rules that your company and your vendors must follow on purchase order and contract transactions.
- [Modifying the sequence of terms for records](#)  
You can change the order in which the terms for a record display. You can modify the sequence to display a more logical order, or to list certain terms sequentially.
- [Creating terms](#)  
You can create terms and conditions that can later be associated with a contract or purchasing record. Terms and conditions can contain information such as: liability concerns, shipping and handling details, and delivery time expectations.
- [Associating existing terms with records](#)  
You can associate terms and conditions with records to define the rules that your company and your vendors must follow on purchase order and contract transactions.
- [Modifying the sequence of terms for records](#)  
You can change the order in which the terms for a record display. You can modify the sequence to display a more logical order, or to list certain terms sequentially.

---

## Creating terms

You can create terms and conditions that can later be associated with a contract or purchasing record. Terms and conditions can contain information such as: liability concerns, shipping and handling details, and delivery time expectations.

### Before you begin

---

Terms and conditions can only be added to purchasing or contracts records set at statuses in progress or waiting on approval.

### Procedure

---

1. In a purchasing or contract application, display the record for which you want to create a term.
2. On the Terms and Conditions tab, click New Row.
3. Specify the sequence and term.
4. Optional: Select the Send to Vendor check box.
5. Save the record.

### What to do next

---

You can set default term and condition values according to site and contract type in the Organizations application. When you create a contract record in a contracts application, the contract inherits the default term and condition values that you assigned to the selected contract type in the Organizations application.

---

## Associating existing terms with records

You can associate terms and conditions with records to define the rules that your company and your vendors must follow on purchase order and contract transactions.

---

### About this task

The Terms and Conditions application maintains a library of terms and conditions with which you and your vendors must comply. You can select terms from this library to apply to contract and purchasing records.

---

### Procedure

1. In a purchasing or contract application, display the record for which you want to select a term.
2. On the Terms and Conditions tab, click Select Terms.
3. Select the Select Record check box next to each term that you want to associate with the record.
4. Click OK.
5. Optional: Select the term in the Terms and Conditions table window and select the Send to Vendor check box.
6. Save the record.

---

## Modifying the sequence of terms for records

You can change the order in which the terms for a record display. You can modify the sequence to display a more logical order, or to list certain terms sequentially.

---

### Procedure

1. In the appropriate Purchasing or Contract application, display the record with which you want to associate a term.
2. Click the Terms and Conditions tab.
3. In the Terms and Conditions table window, locate the rows for which you want to change the sequence.
4. In the Sequence column for the appropriate rows, specify a value. You can enter any integer up to 9999. The product defaults the sequence numbers to multiples of 10. You can rearrange the order without renumbering the entire sequence.
5. Click Save.

---

## Receiving

In a large enterprise, you can have a centralized purchasing department for several sites. Each site receives its own materials and services. You use the Receiving application to receive materials and services. You use this application to record materials and services to the database when they are delivered to a site. You can also return materials to vendors.

You can perform the following tasks using the Receiving application:

- Add a conversion factor, for example, from case to each, to the database.
- Add a unit of measure, for example, feet or gallons, to the database.
- Approve the receipt of an item that requires inspection.
- Bookmark a record so that you can view it at a later time.
- Enter asset numbers and other asset data when receiving rotating items.
- Modify a conversion factor.
- Modify a unit of measure.
- Void receipts for transactions that occurred in error.
- Return items, rotating assets, and services.
- Choose to accept or to return materials or services that are received in excess of the ordered quantity.
- Run reports.
- [Receipts overview](#)  
Purchase order line items such as materials or items are received at a site. Items are inspected, serialized or both before transferring them to the appropriate storeroom, updating details, and issuing receipts.
- [Working with received items](#)  
You can receive materials and services from purchase orders and record the delivery to a site. Items that require inspection, serialization, or both can be transferred to a holding location for inspection. Once approved, you can update details before issuing material or service receipts. Partial deliveries or incorrect deliveries can also be managed.

---

## Receipts overview

Purchase order line items such as materials or items are received at a site. Items are inspected, serialized or both before transferring them to the appropriate storeroom, updating details, and issuing receipts.

- **[Purchasing process](#)**  
The steps in the purchasing process include creating purchase requisitions, creating purchase orders, receiving services and items, and recording vendor invoices.
- **[Holding locations](#)**  
Items that require inspection, serialization, or both go into a holding location before they can be transferred to the appropriate storeroom (or into a direct issue location). Each site can have only one holding location.
- **[Material receipts](#)**  
Material receipts refer to data, such as quantities and lot numbers, associated with items that are used for work done on-site by your employees.
- **[Service receipts](#)**  
Service receipts refer to data associated with any service, such as repairs to assets, that are provided by a vendor or a contractor.
- **[Rules for voiding receipt transactions](#)**  
You can void a transaction that was applied to a purchase order in error. A void is a reversal that brings the receipt back to its former state. A voided receipt is similar to a return, with the exception that a voided receipt cannot be considered for use on a credit invoice.
- **[Return of assets to vendors](#)**  
You can return rotating assets and direct-issue items to vendors. For example, if a rotating asset has a defect, you can return the asset.
- **[Records related to receipts](#)**  
If you have records that are associated with receipts, such as invoices, purchase orders, and requests for quotations, you can view these records. You can obtain a comprehensive look at all of the data that are related to receipts.

---

## Purchasing process

The steps in the purchasing process include creating purchase requisitions, creating purchase orders, receiving services and items, and recording vendor invoices.

The following example illustrates the purchasing process from requisitioning through invoicing.

---

### Step 1: Create the purchase requisition

You can create and approve a purchase requisition 98074 for the following services and related materials:

- Two contract programmers (1,000 hours each)
- Two personal computers
- A software package
- Rental furniture (desks, chairs)

---

### Step 2: Create the purchase orders

You can create the following purchase orders, one for each vendor by using the Copy PR Line Items to PO action in the Purchase Orders application:

- Purchase order 98105 that contains two contract programmers (1,000 hours each)
- Purchase order 98106 that contains two personal computers
- Purchase order 98107 that contains a software package
- Purchase order 98108 that contains rental furniture (desks, chairs)

---

### Step 3: Receive the services and items

When you record receipts from each vendor, you must use the appropriate receipts tab in the Receiving application and the Select Ordered Services and Select Ordered Items actions.

---

### Step 4: Record vendor invoices

After you purchase materials and services, your company receives bills, or invoices, from the vendors. You use the Invoices application to record vendor invoices as you receive them. When you create invoice records you can list purchase order details on the invoice when it is appropriate.

You use the Copy PO Lines action to copy lines from either the receipts or the purchase order to the Invoice Lines tab. You can also view lines that are not on the invoice for items or services received, and add the lines to the invoice.

---

## Holding locations

Items that require inspection, serialization, or both go into a holding location before they can be transferred to the appropriate storeroom (or into a direct issue location). Each site can have only one holding location.

The status of the receipt line item is WINSP (Waiting for Inspection) or WASSET (Waiting for Serialization). The status of the item changes to COMP (Complete) after the item is inspected, serialized, or both. A transfer transaction is created, where the item is moved from the holding location to its appropriate storeroom or to its direct issue location.

- **[Inspection statuses](#)**  
When an inspection is required upon receipt of an item or a service, the inspection statuses describe where a line item is in the inspection process.

---

## Inspection statuses

When an inspection is required upon receipt of an item or a service, the inspection statuses describe where a line item is in the inspection process.

The following statuses pertain to items or services that require an inspection:

### Waiting for Inspection (WINSP)

Indicates that the line item is in the process of being received, but has not yet been entered into inventory. The line item is in a holding location, where it stays until an inspection is completed. After inspection, the line item status will change to either WASSET or COMP status, depending on whether it is a rotating item.

### Waiting for Serialization (WASSET)

Indicates that the line item is a rotating item that is waiting to have an asset number assigned to it. If the line item requires inspection, the inspection has already taken place if its status is WASSET. The item is still in the holding location; it has not yet been sent to its appropriate storeroom or to its direct issue location. After the item has been serialized, its status will be changed to COMP (Complete).

### Complete (COMP)

Indicates that the line item has been received, and if necessary, inspected and serialized. When the status of the line item changes to COMP, a transfer transaction is created. The transaction transfers the item to its appropriate storeroom or to its direct issue location. If the line item is not rotating and does not require inspection, its status is COMP upon receipt.

---

## Material receipts

Material receipts refer to data, such as quantities and lot numbers, associated with items that are used for work done on-site by your employees.

When you receive inventory items against a purchase order, the quantities are updated in inventory and an inventory transaction is generated. You can also receive materials not tracked in inventory, but which require a purchase order.

For example, a catered lunch or a new desk is not stored in inventory or tracked by an item number. You would, however, track the costs on purchase orders and receipts.

---

## Service receipts

Service receipts refer to data associated with any service, such as repairs to assets, that are provided by a vendor or a contractor.

The service can be performed on-site or off site. You specify service purchases either in terms of quantities and unit costs, or as a single lump sum amount. You use the same terms on the receipt transaction as those terms used on the service purchase order.

---

## Rules for voiding receipt transactions

You can void a transaction that was applied to a purchase order in error. A void is a reversal that brings the receipt back to its former state. A voided receipt is similar to a return, with the exception that a voided receipt cannot be considered for use on a credit invoice.

The following rules apply to the voiding of receipt transactions:

- If a line item has been received and invoiced, you cannot void the line item.
- You can void both rotating items and non-rotating items.
- You can void line items and services that are in WINSP (Waiting for Inspection) status.
- You can void receipt lines for items and services that have not been inspected.
- You cannot void receipts for serialized assets (that is, in COMP (Complete) status).
- You cannot void returned items.
- You cannot void receipts that have been partially or fully returned.

---

## Return of assets to vendors

You can return rotating assets and direct-issue items to vendors. For example, if a rotating asset has a defect, you can return the asset.

The following restrictions apply to the return of rotating assets and items to vendors:

- The asset must be located in the same storeroom where it was received.
- The inventory cost for the asset must be equal to the cost of the line being reversed.
- A direct-issue item cannot be returned if it was moved.

---

## Records related to receipts

If you have records that are associated with receipts, such as invoices, purchase orders, and requests for quotations, you can view these records. You can obtain a comprehensive look at all of the data that are related to receipts.

To view the transactions and the records that are specific to either material receipt lines or to service receipt lines, click the View Related Records icon at the end of the line. In the View Related Records window, you can click the identifier for an invoice, a purchase order, a contract, and a request for quotation to access that record in the relevant application.

---

## Working with received items

You can receive materials and services from purchase orders and record the delivery to a site. Items that require inspection, serialization, or both can be transferred to a holding location for inspection. Once approved, you can update details before issuing material or service receipts. Partial deliveries or incorrect deliveries can also be managed.

- **[Receiving materials](#)**  
You can record information about items received on an approved purchase order. When vendors ship materials to your company, you record the materials received against the purchase order. If you receive a line item that is damaged, you can receive the full shipment amount and return the rejected quantity.
- **[Receiving services](#)**  
If your company requires receipts for services, you can record the services received against an approved purchase order. You can copy all the purchase order line items if all services have been received, or you can enter partial receipts. You record total or partial receipts of a service on a purchase order the same way that you record the receipt of materials.
- **[Receiving rotating items](#)**  
Each rotating item is received into inventory with an item number. You can enter line items for rotating items. You can specify asset identifiers for rotating assets, or autonumber all the rotating items. You also might need to change information when recording the receipt of materials.
- **[Receiving partial shipments](#)**  
You can receive part of the items on a purchase order to record a partial shipment or to record damaged goods.
- **[Returning items](#)**  
You can select items that were already received that you want to return. For example, you can select a damaged item to return it. When you apply this action to each selected item, a negative receipt is displayed for each item.
- **[Returning rotating assets](#)**  
You can select rotating assets that were already received that you want to return. For example, you can select a damaged rotating asset to return it.
- **[Returning services](#)**  
You can return services that were already received. For example, you can select a service to return it. When you apply this action to each selected service, a negative receipt is shown for each service.
- **[Selecting receipts to void](#)**  
You can void a transaction that was applied to a purchase order in error. A void is a reversal that returns the receipt back to its former state. For example, you saved the wrong line item to the purchase order, and you want to remove the line item from the purchase order.

---

## Receiving materials

You can record information about items received on an approved purchase order. When vendors ship materials to your company, you record the materials received against the purchase order. If you receive a line item that is damaged, you can receive the full shipment amount and return the rejected quantity.

---

## Before you begin

To create receipts, the status of the purchase order must be either In Progress (INPRG) or Approved (APPR).

---

## About this task

A receipt tolerance quantity or amount may have been set for a line item in the purchase order. If the quantity or the amount of a line item received exceeds the receipt tolerance set for that line item, you can choose to receive part of the order or to receive the tolerance amount or quantity set. If you cannot receive any items in excess of the ordered quantity, you must modify or delete the associated line item.

---

## Procedure

1. On the List tab of the Receiving application, select the purchase order for which you want to receive materials.
  2. On the Material Receipts tab, select Select Ordered Items.
  3. In the Select Ordered Items window, select the check box for each line item that you want to receive. To select all the items on the purchase order, select the check box in the table header.
  4. Click OK.
  5. Optional: Modify the line item information, such as the quantity, in the Material Receipts window.  
When you save the receipt, the fields on the Material Receipts window become read-only.
  6. Click Save Receipt.
- **[Receiving materials that require inspection](#)**  
Some materials require inspection before they can be entered into inventory. Upon receipt, these materials are stored in a holding location until an inspection is performed and the inspection status is changed.
  - **[Receiving materials with changes](#)**  
You can change information when receiving materials.

---

## Receiving materials that require inspection

Some materials require inspection before they can be entered into inventory. Upon receipt, these materials are stored in a holding location until an inspection is performed and the inspection status is changed.

### Before you begin

---

To create receipts, the status of the purchase order must be either INPRG (In Progress) or APPR (Approved).

### Procedure

---

1. On the List tab of the Receiving application, select the purchase order for which you want to receive materials that require inspection.
2. On the Material Receipts tab, click Select Ordered Items.
3. In the Select Ordered Items window, click the check box for each item that you want to receive. To select all the items on the purchase order, select the check box in the table header.
4. Click OK.  
The line items you selected appear in the Material Receipts window of the Material Receipts tab. If the item requires inspection, its status is WINSP (Waiting for Inspection).
5. Optional: In the Material Receipts window, change the selected material information, such as the quantity.
6. Click Save Receipt.
7. Perform the inspection and change the inspection status as follows:
  - If the item is a rotating item that requires serialization, change the status to WASSET (Waiting for Serialization).
  - If the item does not require serialization, change the status to COMP (Complete). The item is transferred from the holding location to either its storeroom or to its direct issue location.
8. Optional: If you want to reject items, type the number of items you want to reject in the Quantity Rejected field. Provide a reason in the Reject Code field to represent, for example, damaged goods. A return transaction is created for any items that you rejected.
9. If the item requires serialization, receive the rotating item.
10. Click Save Receipt.

---

## Receiving materials with changes

You can change information when receiving materials.

### Before you begin

---

To create receipts, the status of the purchase order must be either INPRG (In Progress) or APPR (Approved).

### About this task

---

If you are receiving a line item that is not a rotating item, but that is damaged, receive the full shipment amount and then return the rejected quantity. Use the Select Items for Return window to return materials.

### Procedure

---

1. On the List tab of the Receiving application, select the purchase order for which you want to receive materials.
2. On the Material Receipts tab, select Select Ordered Items.
3. In the Select Ordered Items window, select the check box for each line item that you want to receive. To select all the items on the purchase order, select the check box in the table header.
4. Click OK.
5. In the Material Receipts window, click View Details on the material receipt line that you want to change.
6. Click Save Receipt. Once you save the receipt, the fields on the Material Receipts tab become read-only.

---

## Receiving services

If your company requires receipts for services, you can record the services received against an approved purchase order. You can copy all the purchase order line items if all services have been received, or you can enter partial receipts. You record total or partial receipts of a service on a purchase order the same way that you record the receipt of materials.

### Before you begin

---

To create receipts, the status of the purchase order must be either INPRG (In Progress) or APPR (Approved).

### About this task

---

A receipt tolerance quantity or amount may have been set for a line item in the purchase order. If the quantity or the amount of a line item received exceeds the receipt tolerance set for that line item, you can choose to receive part of the order or to receive the tolerance amount or quantity set. If you cannot receive any items in excess of the ordered quantity, you must modify or delete the associated line item.

## Procedure

---

1. On the List tab of the Receiving application, select the purchase order for which you want to receive a service.
  2. On the Service Receipts tab, click Select Ordered Services.
  3. In the Select Ordered Services window, select the check box for each service that you want to receive. To select all the services on the purchase order, select the check box in the table header.
  4. Click OK.
  5. Optional: Change the selected services information, such as the quantity, in the Service Receipts table window. When you save the receipt, these fields become read-only.
  6. Click Save Receipt.
- **Receiving services that require inspection**  
Some services require inspection before they can be entered into inventory. Upon receipt, these materials are stored in a holding location until an inspection is performed and the inspection status is changed.

---

## Receiving services that require inspection

Some services require inspection before they can be entered into inventory. Upon receipt, these materials are stored in a holding location until an inspection is performed and the inspection status is changed.

### Before you begin

---

To create receipts, the status of the purchase order must be either In Progress (INPRG) or Approved (APPR).

## Procedure

---

1. From the List tab of the Receiving application, select the purchase order for which you want to receive services.
2. From the Service Receipts tab, click Select Ordered Services.
3. In the Select Ordered Services window, select the check box for each service that you want to receive. To select all the services on the purchase order, select the check box in the table header.
4. Click OK.  
The services you selected are shown in the Service Receipts table window. If the service requires inspection, its status is WINSP (Waiting for Inspection).
5. Optional: Change the information, such as the quantity, in the Service Receipts table window.
6. Click Save Receipt.
7. Optional: If you want to reject services, type a number in the Quantity Rejected field, and provide a reason code in the Reject Code field.
8. Change the inspection status of the service. The status of the service is now Complete (COMP). A return transaction is created for any services that you rejected.
9. Click Save Receipt.

---

## Receiving rotating items

Each rotating item is received into inventory with an item number. You can enter line items for rotating items. You can specify asset identifiers for rotating assets, or autonumber all the rotating items. You also might need to change information when recording the receipt of materials.

### Before you begin

---

To create receipts, the status of the purchase order must be either In Progress (INPRG) or Approved (APPR).

### About this task

---

If the rotating item requires inspection (WINSP), perform the inspection and change the inspection status. After changing the inspection status, the status of the rotating item is WASSET. The rotating item is also tracked in the Assets application with an asset number.

## Procedure

---

1. On the List tab of the Receiving application, select the purchase order for which you want to receive a service.
2. On the Material Receipts tab, click Select Ordered Items.
3. In the Select Ordered Items window, select the check box for each service that you want to receive. To select all the items on the purchase order, select the check box in the table header.
4. Click OK. If the item requires inspection, its status is WINSP (Waiting for Inspection). If the item does not require inspection, its status is WASSET (Waiting for Serialization).
5. Optional: Change the Quantity field to change the quantity received.
6. Click Save Receipt.

7. Select the Receive Rotating Items action.
  8. To specify asset numbers for the line items, complete either of the following actions:
    - Specify a value in the Asset field for each line item.
    - Click Autonumber to have the product assign numbers to the items.
  9. You can assign a serial number in the Serial # field for each asset. The serial number appears on the asset record in the Assets application. You can also enter the serial number in the Assets application.
  10. Optional: Apply an item assembly structure to each asset.
  11. Click OK.

An asset record is created and the status of the line item is changed from WASSET to COMP (Complete) for each item that you received. If you received a rotating item that required inspection, a transfer transaction is created. In this transaction, the item is transferred from the holding location to either its storeroom or to its direct issue location.
- [Applying item assembly structures to rotating items](#)

When you receive rotating items, you can apply an item assembly structure to each item.

---

## Applying item assembly structures to rotating items

When you receive rotating items, you can apply an item assembly structure to each item.

### Procedure

---

1. From the List tab of the Receiving application, select the purchase order for which you would like to receive rotating items.
2. Click the Material Receipts tab and select the Receive Rotating Items action.
3. In the Receive Rotating Items window, click Apply IAS in the row of the asset to which you want to apply an item assembly structure.
4. In the Apply Item Assembly table window, the first level of the item assembly structure for that asset is listed. To assign an asset number to each asset in the subassembly, click the row for that asset and perform one of the following actions:
  - In the Asset field, specify a value.
  - Click Autonumber All to have asset numbers assigned to each asset. Asset numbers are assigned to the items in the first level of the hierarchy, and all of the child items.
5. Click Detail Menu in the Item field for the selected item and select Move To to move down to the next level in the item assembly structure hierarchy. The item is moved to the Current Asset field, and its child items display in the table.
6. If you manually entered values for the top level items in the item assembly structure, you can either autonumber the items in the lower levels of the hierarchy or assign values to each item individually.

To move back up the hierarchy, in the Belongs To field, click Detail Menu and select Move To. The parent moves up to the Current Asset field, and its child items display in the table.
7. Click OK.
8. Click Save Receipt.

---

## Receiving partial shipments

You can receive part of the items on a purchase order to record a partial shipment or to record damaged goods.

### Before you begin

---

To create receipts, the status of the purchase order must be either INPRG (In Progress) or APPR (Approved).

### Procedure

---

1. On the List tab of the Receiving application, select the purchase order for which you want to create receipts.
2. On the Material Receipts tab, click Select Ordered Items.
3. In the Select Ordered Items window, select the check box for each line item that you want to receive. To select all the items on the purchase order, select the check box in the table header.
4. Click OK.
5. In the Material Receipts window, click View Details on the material receipt line that you want to change.
6. Change the receipt line as needed. Change the Quantity field to reflect a partial shipment. When you save the receipt, the fields on the Material Receipts window become read-only.
7. Click Save Receipt.

---

## Returning items

You can select items that were already received that you want to return. For example, you can select a damaged item to return it. When you apply this action to each selected item, a negative receipt is displayed for each item.

### Procedure

---

1. On the List tab of the Receiving application, select the approved purchase order record that contains the items that you want to return.

2. On the Material Receipts tab, click Select Items for Return.  
The Select Items for Return window displays only items that are available to return.
3. Perform either of the following actions:
  - To return the received quantity of an item, select the check box for the item that you want to return.
  - To return a partial quantity of an item, select the check box for the item, and specify a value in the Quantity to Return field. If you want to return all the items, select the check box in the table header.
4. Click OK.  
A return transaction is created for the specified item. In the Material Receipts table window, the Quantity field for each item you selected to return displays a negative value.
5. Optional: To enter codes for each returned item, click View Details on the material receipt line and then type a code in the Reject Code field.
6. Click Save Receipt.

---

## Returning rotating assets

You can select rotating assets that were already received that you want to return. For example, you can select a damaged rotating asset to return it.

### Before you begin

---

The status of the purchase order must be in APPR (Approved) status.

### About this task

---

When you return a rotating asset, a negative receipt shows for each selected asset. The transaction shows a type of RETURN. When you expand the line that contains the return transaction, the rotating asset number shows for the asset that was returned.

### Procedure

---

1. On the List tab of the Receiving application, select the approved purchase order record that contains the assets that you want to return.
2. On the Material Receipts tab, click Select Assets for Return.  
The Select Assets for Return window displays only the rotating assets that are available to return.
3. To return the received quantity of a rotating asset, select the check box for the asset that you want to return.
4. Click OK.
5. Save the receipt record.

---

## Returning services

You can return services that were already received. For example, you can select a service to return it. When you apply this action to each selected service, a negative receipt is shown for each service.

### Before you begin

---

The status of the purchase order must be in either APPR (Approved) status or in INPRG (In Progress) status.

### Procedure

---

1. On the List tab of the Receiving application, select the approved purchase order record that contains the services that you want to return.
2. On the Service Receipts tab, click Select Services for Return.  
The Select Services for Return window displays only services that are available to return.
3. Perform one of the following actions:
  - To return the received quantity of a service, select the check box for the service that you want to return.
  - To return a partial quantity of a service, select the check box for the service, and specify a value in the Quantity to Return field. If you want to return the entire service, select the check box in the table header.
  - To return a service by its cost, specify a value in the Cost to Return field.
4. Click OK.  
A return transaction is created for the specified service. In the Service Receipts window, the Quantity field for each service that you selected to return displays a negative value.
5. Optional: To enter codes for each returned service, click View Details on the service receipt line and then type a code in the Reject Code field.
6. Click Save Receipt.

---

## Selecting receipts to void

You can void a transaction that was applied to a purchase order in error. A void is a reversal that returns the receipt back to its former state. For example, you saved the wrong line item to the purchase order, and you want to remove the line item from the purchase order.

## Before you begin

The line item from the purchase order must have been received.

## About this task

A receipt that is voided is similar to a return, with the exception that a receipt that is voided cannot be considered for use on a credit invoice. Any costs associated with a voided transaction are removed from the receipt cost calculation. Receipt transactions that are voided are not included on invoices. Balance updates and inventory cost calculations against storerooms are reversed, and reversal transactions are created for the specified items.

## Procedure

1. On the List tab of the Receiving application, select the approved purchase order record that contains the items that you want to void.
2. On the Material Receipts tab, click Select Receipts to Void.  
The Select Receipts to Void window shows only items that are available to void.
3. Select the check box for the line item that you want to void.
4. Click OK.
5. Click Save Receipt.

## Shipment Receiving

In a large organization, you can transfer inventory items or tools between storerooms within the same site or across sites and organizations and track their delivery. You create shipment receipt records to acknowledge the receipt of transferred items and update inventory balances at the destination storeroom.

You create shipment receipt records to log information such as the quantity of items that were received, the date the items were received, and the destination storeroom for the shipment.

When the shipped items are received, the storeroom balance is updated for the inventory records at the destination site. The quantity of received items is also verified to determine whether the number of shipped items satisfies the requirement at the destination site. The shipment is considered to be complete or partial based on this requirement, and the inventory usage record is updated according to this status.

- [Shipment inspection statuses](#)  
A site or organization can specify that an inspection is required upon receipt of inventory items. The inspection status indicates the stage of inspection that applies to the shipment item.
- [Rules for voiding shipment receipts](#)  
You can void a shipment receipt transaction that was created in error. When you void a shipment receipt, the record returns to its former state and storeroom balances are resolved.

## Shipment inspection statuses

A site or organization can specify that an inspection is required upon receipt of inventory items. The inspection status indicates the stage of inspection that applies to the shipment item.

The following statuses apply to shipment items that undergo an inspection:

Status	Description
Waiting for Inspection (WINSP)	Indicates that the item is in the process of being received, but is not entered into inventory. The item is in a holding location, where it stays until the inspection is complete. After inspection, the item status changes to either Waiting for Serialization or Complete, depending on whether it is a rotating item.
Waiting for Serialization (WASSET)	Indicates that the item is a rotating item and that review and acceptance of the asset numbers in the receipt is required. If the item requires inspection, the inspection has already occurred. The item is still in the holding location; it has not been sent to its destination storeroom or to its direct issue location. After the item is serialized, the status is changed to Complete.
Complete (COMP)	Indicates that the item was received, and if necessary, inspected and serialized. When the status of the item changes to Complete, a transfer transaction is created. The item is transferred to the appropriate storeroom or to a direct issue location. If the item is not rotating and does not require inspection, its status is Complete when it is received.

## Rules for voiding shipment receipts

You can void a shipment receipt transaction that was created in error. When you void a shipment receipt, the record returns to its former state and storeroom balances are resolved.

A voided receipt has the same effect on storeroom balances as a return, but a voided receipt cannot be used on a credit invoice.

The following conditions apply to voiding shipment receipts:

- You can void non-rotating items.
- You can void shipment line items that are in Waiting for Inspection (WINSP) status.
- You can void shipment line items that have been inspected but not returned.

---

# Invoices

You use the Invoices application to record vendor invoices as you receive them. You can also record debit and credit notes from vendors, and match invoice details against purchase orders and receipts. You can reverse approved or paid invoices, credit memos, or debit memos. Items that are part of the consignment inventory can be invoiced when the items are used.

Entering invoices lets you match the invoice information against purchase orders and receipts of materials and services. The invoice can then be approved and routed to Accounts Payable.

You create invoices that can represent one of the following invoice types:

An invoice related to a single purchase order

You enter information such as the invoice number, and the corresponding purchase order number on the Invoice tab. Any receipts recorded for the purchase order can be invoiced on the Invoice Lines tab. If the same purchase order number exists for multiple sites, then you can select the site for the purchase order.

An invoice related to many purchase orders for a single vendor

You enter general invoice data on the Invoice tab, including the vendor, then list the related purchase orders on the Invoice Lines tab.

An invoice without a related purchase order for a single vendor

Typically, such an invoice represents a bill for which there is no purchase requisition or purchase order. You enter invoice-specific information about the Invoice tab. This type of invoice might be appropriate if, for example, you receive an invoice for rent or for a telephone bill.

An invoice with purchase order sites that are different from the site from which the invoice is generated

The invoice must be associated with the same organization as the purchase order sites.

An invoice for items that are created as consignment items

A consignment payment invoice can be generated, either manually or automatically, for financial transactions that occur when consignment items are consumed from a storeroom.

- [Invoices overview](#)

You can record vendor invoices as you receive them, record debit and credit notes from vendors, and match invoice details against purchase orders and receipts. You can also create invoices for which there are no purchase order numbers.

- [Working with invoices](#)

You can record invoices as well as debit and credit notes from vendors. You can match invoice details against purchase orders and receipts. You can create invoices for which there are no purchase orders. You can also create consignment payment invoices that are generated when consignment items are used.

---

## Invoices overview

You can record vendor invoices as you receive them, record debit and credit notes from vendors, and match invoice details against purchase orders and receipts. You can also create invoices for which there are no purchase order numbers.

- [Purchasing process](#)

The steps in the purchasing process include creating purchase requisitions, creating purchase orders, receiving services and items, and recording vendor invoices.

- [Invoice statuses](#)

After an invoice is created, you use the invoice status to indicate where it is in the processing cycle. Changing statuses on invoices has implications, depending on the status being changed.

- [Quantity field and automatic matches](#)

On invoices for materials, when you enter a number in the Quantity field of the Invoice Lines tab, a search is performed for matching material receipts. In seeking a match between an invoice quantity and a receipt quantity, a match is made to either a single quantity in a receipt line item or to the total quantity for a receipt.

- [Receipt tolerances and invoice lines](#)

A receipt tolerance sets a limit for the quantity or the amount that can be invoiced for a service line item or a standard service line item. The receipt tolerance is set for an item in the Item Master application. The receipt tolerance can be modified in the purchase order.

- [Consignment payment invoices](#)

Consignment payment invoices can be generated, either manually or automatically, for financial transactions that occur when consignment items are used.

- [Reversal of invoices](#)

When an original invoice contains errors, such as unit cost mistakes, you can replace the original invoice by reversing it. The replacement for the original invoice contains the updated information. You can reverse an invoice without creating a return transaction.

- [Tax-exempt status](#)

The tax-exempt option indicates whether an item, a tool, or a service is taxable. You might want to set the tax-exempt status, depending on where an item or a service is acquired, and how an item or a service is used.

- [Terms and conditions](#)

You can create and maintain a library of terms and conditions that your company and your vendors must follow on purchase order and contract transactions. Terms and conditions can contain information such as: liability concerns, shipping and handling details, and delivery time expectations.

- [Automatic allocation of standard service costs](#)

If your site does not use the Invoices application, services are prorated upon purchase order approval in the Purchase Orders application. If your site uses the Invoices application to manage invoices, services are prorated or allocated in Invoices.

- [How invoice variances affect the average costs of items](#)

When calculating the average cost of an inventory item, the cost and currency variances are used to update inventory costs. This action occurs when the Update Cost/Currency Variances on Inventory Costs check box is selected. If the check box is cleared, the variance costs are not used to update inventory costs but are written to variance accounts instead.

- [Records related to invoices](#)

If you have records that are associated with invoices, such as purchase orders, contracts, and requests for quotations, you can view these records. You can

obtain a comprehensive look at all of the data that are related to invoices.

---

## Purchasing process

The steps in the purchasing process include creating purchase requisitions, creating purchase orders, receiving services and items, and recording vendor invoices.

The following example illustrates the purchasing process from requisitioning through invoicing.

---

### Step 1: Create the purchase requisition

You can create and approve a purchase requisition 98074 for the following services and related materials:

- Two contract programmers (1,000 hours each)
- Two personal computers
- A software package
- Rental furniture (desks, chairs)

---

### Step 2: Create the purchase orders

You can create the following purchase orders, one for each vendor by using the Copy PR Line Items to PO action in the Purchase Orders application:

- Purchase order 98105 that contains two contract programmers (1,000 hours each)
- Purchase order 98106 that contains two personal computers
- Purchase order 98107 that contains a software package
- Purchase order 98108 that contains rental furniture (desks, chairs)

---

### Step 3: Receive the services and items

When you record receipts from each vendor, you must use the appropriate receipts tab in the Receiving application and the Select Ordered Services and Select Ordered Items actions.

---

### Step 4: Record vendor invoices

After you purchase materials and services, your company receives bills, or invoices, from the vendors. You use the Invoices application to record vendor invoices as you receive them. When you create invoice records you can list purchase order details on the invoice when it is appropriate.

You use the Copy PO Lines action to copy lines from either the receipts or the purchase order to the Invoice Lines tab. You can also view lines that are not on the invoice for items or services received, and add the lines to the invoice.

---

## Invoice statuses

After an invoice is created, you use the invoice status to indicate where it is in the processing cycle. Changing statuses on invoices has implications, depending on the status being changed.

The following table lists and describes the statuses for invoices.

Status of invoice	Description
-------------------	-------------

Status of invoice	Description
Approved (APPR)	<p>Available only if the current invoice status is Entered, Waiting for Approval, or Hold. If you change the status directly to Paid without first approving the invoice, the invoice is validated for approval criteria. An approved invoice is stored as a history record; for invoices in history, you can change only the Check Code field, the Check # field, and the Paid Date field.</p> <p>If the Close PO check box is selected on the Change Status window for the invoice, and you change the status to Approved, all purchase orders associated with the invoice are closed.</p> <p>An invoice must meet the following conditions before it can be approved:</p> <ul style="list-style-type: none"> <li>• If the invoice is to be paid in foreign currency, there must be an active exchange rate for that currency (in the Currency application) on the date of approval. If not, the invoice cannot be approved. (If the exchange rate has changed since you created the invoice, the product updates the Total Base Cost field upon approval.)</li> <li>• The prices on the invoice must fall within a specified range of the prices on the purchase order. Your system administrator can define the amount by which the invoice price can vary from the purchase order price and still be approved. This task is done using the Limits and Tolerances tab in the Security Groups application.</li> <li>• Standard service costs added to the invoice (such as freight charges or installation fees) must fall within limits set by your administrator. This task is set using the Limits and Tolerances tab in the Security Groups application.</li> <li>• Tax costs added to the invoice must fall within limits set by your administrator (also set with the Limits and Tolerances tab in the Security Groups application).</li> <li>• Line items that must be received before the invoice is approved are checked to ensure that the receipts have been entered into the system.</li> </ul> <p>When the conditions are met, the price difference between the invoice and the purchase order is calculated. Price differences can be due to a change in the active exchange rate, to a difference between what the vendor charged and the original purchase order price, or to both. Price differences are handled in one of two ways:</p> <ul style="list-style-type: none"> <li>• For issue on receipt items (that is, those items not purchased for inventory), the price difference is always applied to the work order, to the location, to the equipment, to the general ledger account specified on the purchase order, or in the Invoice Lines tab.</li> <li>• For inventory items, the Average Cost field is updated.</li> </ul> <p>You cannot change the status of an original approved invoice to Paid if that invoice has a Pending Reversal invoice associated with it. You must first cancel the Pending Reversal invoice.</p>
Cancel (CANCEL)	Available only on the Change Status window if the current invoice status is Entered, Waiting for Approval, or Hold. You cannot cancel an approved invoice. A canceled invoice is stored as a history record and cannot be modified.
Entered (ENTERED)	The default status when you create an invoice. A newly entered invoice has some fields completed by default; some of these fields are read-only. An invoice with the status of Entered can be edited. Once the status of an invoice is changed from Entered using the Change Status window, the Entered status is no longer available.
Hold (HOLD)	Available only if the current invoice status is Entered or Waiting on Approval (WAPPR). If the invoice must not be approved or paid, you can change the invoice to Hold status. For example, if you received an invoice but have not received the items, or if there is a discrepancy between the invoice and the receipts, you can place the invoice on Hold status. An invoice in Hold can be edited.
Paid (PAID)	Available only if the current invoice status is Entered, Waiting for Approval, Approved, or Hold. If you change the status directly to Paid without first approving the invoice, the product approves the invoice. A paid invoice is stored as a history record and cannot be modified.
Pending Reversal (PENDREV)	<p>Available only if the original invoice, the original credit memo, or the original debit memo status is Approved or Paid. Indicates that the invoice is in the process of being reversed. For example, if an error was made on the unit cost on the original invoice, you can reverse the invoice without having to create a return transaction. You can change the status of a Pending Reversal invoice to Cancel or to Approved. When you approve a Pending Reversal invoice, any details created in the original invoice are reversed. All records related to the original invoice are updated with the new information, such as inventory records. Documents that were attached to the original invoice are added to the reversed invoice.</p> <p>The following constraints apply to invoices that are in Pending Reversal status:</p> <ul style="list-style-type: none"> <li>• You cannot duplicate the invoice.</li> <li>• You cannot allocate services to the invoice.</li> <li>• You cannot distribute costs to the invoice.</li> <li>• You cannot change the vendor for the invoice.</li> <li>• You cannot copy lines from a purchase order to the invoice.</li> </ul>
Reversed (REVERSED)	Indicates that an approved or a paid invoice, credit memo, or debit memo has been reversed. A reversed document is stored as a history record that cannot be modified. You cannot duplicate an invoice that has been reversed.
Scheduled (SCHED)	Indicates that the invoice is part of a payment schedule, set up for a specific contract. Invoices with this status can be created only from the Contracts applications. An invoice with a status of Scheduled can be changed to any status except Entered.
Waiting on Approval (WAPPR)	Available only if the current invoice status is Entered or Hold. You use this status to indicate that invoice information has been entered. The invoice is ready for review and approval by the appropriate level of staff. An invoice waiting for approval can be edited.

## Quantity field and automatic matches

On invoices for materials, when you enter a number in the Quantity field of the Invoice Lines tab, a search is performed for matching material receipts. In seeking a match between an invoice quantity and a receipt quantity, a match is made to either a single quantity in a receipt line item or to the total quantity for a receipt.

The search for a match is performed according to the following criteria:

- If you enter an invoice quantity that equals a receipt quantity, the invoice is matched with the receipt.
- If you enter an invoice quantity that is less than a receipt quantity, the invoice is matched with the receipt.

In any of the following cases, you receive a warning and the invoice is not matched with the receipt:

- You specify a purchase order and a purchase order line item. The invoice quantity exceeds either the quantity that has not been invoiced or the order quantity.
- You specify a purchase order and a purchase order line item. The invoice quantity causes an invoice total exceeding the total cost of the purchase order.
- You specify a purchase order on which the Receipt Required check box is selected, and you enter a quantity that does not match the receipts.

---

## Receipt tolerances and invoice lines

A receipt tolerance sets a limit for the quantity or the amount that can be invoiced for a service line item or a standard service line item. The receipt tolerance is set for an item in the Item Master application. The receipt tolerance can be modified in the purchase order.

If the quantity or the amount of the line item received exceeds the receipt tolerance set for that item, you can invoice the item up to the receipt tolerance amount or up to the quantity set. If you cannot receive any service line items in excess of the ordered quantity, you must modify or delete the associated line item.

---

## Consignment payment invoices

Consignment payment invoices can be generated, either manually or automatically, for financial transactions that occur when consignment items are used.

When you create an item in the Item Master application, you can specify the item as a consignment item. Consignment items become part of the consignment inventory.

Purchase order lines for consumption items can only be invoiced upon usage of the item.

Consignment payment invoices can be generated in any of the following ways:

### Individual Consumption

Each consumption transaction (either positive or negative) of a consignment item creates a single line on a consignment invoice.

### Frequency

If invoices are based on a frequency, then the product-provided cron task (ConsignmentInvoiceCronTask) evaluates consignment items to be processed. The frequency and units specified for the inventory record are used to determine the next invoice date. The cron task is set to run daily, unless you specify another value. A single invoice that contains up to the maximum number of lines is created for each vendor. You use the Organizations application to set the maximum number of lines on consignment invoices.

### Manual

You can generate a consignment invoice manually. You select the Consignment Payment invoice type, and choose from the list of available consumption transactions to include on the invoice lines.

---

## Reversal of invoices

When an original invoice contains errors, such as unit cost mistakes, you can replace the original invoice by reversing it. The replacement for the original invoice contains the updated information. You can reverse an invoice without creating a return transaction.

The status of the invoice, the credit memo, or the debit memo that is being reversed must be Approved or Paid. When reversing an invoice, the user default insert site does not have to be the same site as the site specified on the original invoice. If the user default insert site is different from the original invoice site, then the reverse invoice uses the site specified on the original invoice. However, the user default insert site must belong to the same organization as the original invoice.

When you approve the reversal or the pending reversal of an invoice, any details that were part of the original invoice are reversed. All records that are related to the original invoice are updated with the new information, such as unit cost. Documents that were attached to the original invoice are added to the replacement invoice. The original invoice becomes a history record.

---

## Tax-exempt status

The tax-exempt option indicates whether an item, a tool, or a service is taxable. You might want to set the tax-exempt status, depending on where an item or a service is acquired, and how an item or a service is used.

The situations under which items or services are tax-exempt vary depending upon your location, and upon current tax regulations. For example, the storeroom for an item might be in a location where sales taxes are not collected. In some cases, if an item becomes part of a product, that item can be tax-exempt. If the item is used as a stand-alone item, then the item is taxable. The buyer for your organization determines the tax-exempt status of items, of tools, and of services.

You can override the tax-exempt status for items, for tools, and for services in the following applications:

- Purchase Requisitions
- Purchase Orders
- Invoices

When you specify the tax-exempt status, you can apply the status at the organization level and at the vendor level.

---

## Terms and conditions

You can create and maintain a library of terms and conditions that your company and your vendors must follow on purchase order and contract transactions. Terms and conditions can contain information such as: liability concerns, shipping and handling details, and delivery time expectations.

You can create a library of term and condition values in the Terms and Conditions application. You use the library to look up and associate terms and conditions to purchase order and contract records. The library is accessible in the Purchase Orders and contracts applications.

You can set default term and condition values according to site and contract type in the Organizations application. When you create a contract record in a contracts application, it inherits the default term and condition values that you assigned to the selected contract type in the Organizations application.

---

## Automatic allocation of standard service costs

If your site does not use the Invoices application, services are prorated upon purchase order approval in the Purchase Orders application. If your site uses the Invoices application to manage invoices, services are prorated or allocated in Invoices.

Upon invoice approval, the standard service costs are prorated across all invoice line items if the standard service can be allocated. That is, if the Prorate Service check box is selected either in the PO Lines tab or in the Invoice Lines tab).

If the Add Standard Service Costs to Direct Issue Items Only check box (available in the Organizations application) is selected, the standard services are allocated to only those invoice line items that have the Issue On Receipt check box selected. The percentage of the cost that is prorated to each line item is based on the line cost of the line item, as shown in the following example.

---

### Example

There are two standard services entered on the invoice. The Prorate Service check box is selected for each. The line costs of the standard services are:

- Standard Service 1: \$100
- Standard Service 2: \$200
- Total: \$300

There are four item invoice lines that generated the standard services. Their line costs are:

- Line 1: \$300
- Line 2: \$400<sup>®</sup>
- Line 3: \$50
- Line 4: \$250
- Total: \$1000

When the invoice is approved, the standard service total of \$300 is prorated as follows:

Table 1. Cost Calculations

Line	Line Cost	% of Service Total Added	Total Prorated Cost	Loaded Cost
Line 1	\$300	30%	\$90	\$390
Line 2	\$400	40%	\$120	\$520
Line 3	\$50	5%	\$15	\$65
Line 4	\$250	25%	\$75	\$325
Totals	\$1000	100%	\$300	\$1300

In the preceding example, if Standard Service 1 cannot be allocated, then only \$200 would be prorated among the four lines.

---

## How invoice variances affect the average costs of items

When calculating the average cost of an inventory item, the cost and currency variances are used to update inventory costs. This action occurs when the Update Cost/Currency Variances on Inventory Costs check box is selected. If the check box is cleared, the variance costs are not used to update inventory costs but are written to variance accounts instead.

The Update Cost/Currency Variances on Inventory Costs option is available from the Inventory Defaults window of the Organizations application.

For any transaction involving movement of items, the change of value in inventory must equal the transaction cost. In any case where this condition is not true, additional transactions must record the difference.

The product uses a perpetual average (or moving average) method for maintaining inventory value.

The primary features of the perpetual average method are the following:

- Inventory is valued at the average cost of the items in stock.
- The average cost is updated each time an item is received into the storeroom.
- Each transaction is considered individually for its effect on the average cost.
- Items are sold or issued at the average cost at the time of the sale or issue.
- Each transaction must balance credit and debit accounts.

Variances must be recorded if transactions affecting an inventory control account do not have an equal effect on inventory value.

## Calculation of average cost for invoice variance

---

When invoice quantity is less than or equal to inventory balance, the average cost is calculated as follows:

- Average cost = cost / quantity

When invoice quantity is greater than inventory balance, the average cost is calculated as follows:

- Average cost = (current average cost \* inventory current balance) + cost/inventory current balance + quantity

In either case, the remaining invoice variance is recorded in the invoice transactions (INVOICETRANS) table.

## Example with invoice variance

---

- Storeroom before invoice approval (after receipts):
  - Balance = 8
  - Average Cost = 10.00
  - Value = 80.00
- Receipt Line (to be matched to the invoice):
  - Quantity = 4
  - Cost = 11.00
- Invoice line (actual invoice):
  - Quantity = 4
  - Cost = 11.10
- Receipt update:
  - Quantity = 0
  - Cost = 0.40
- Storeroom after invoice approval:
  - Balance = 8
  - Average Cost = 10.05
  - Value = 80.40

## Example without invoice variance (balance is less than or equal to invoice quantity):

---

- Storeroom before invoice approval (after receipts and issues):
  - Balance = 1
  - Average Cost = 10.00
  - Value = 10.00
- Receipt Line (to be matched to the invoice):
  - Quantity = 4
  - Cost = 11.00
- Invoice line (actual invoice):
  - Quantity = 4
  - Cost = 11.10 [ total variance is 0.40:  $4 * (11.10 - 11.00)$  ]
- Receipt update:
  - Quantity = 0
  - Cost = 0.10 [ applied to inventory:  $1 * (11.10 - 11.00)$  ]
- Invoice variance:
  - Quantity = 0
  - Cost = 0.30 [ applied as invoice variance:  $(4 - 1) * (11.10 - 11.00)$  ]
- Storeroom after invoice approval:
  - Balance = 1
  - Average Cost = 10.10
  - Value = 10.10

---

## Records related to invoices

If you have records that are associated with invoices, such as purchase orders, contracts, and requests for quotations, you can view these records. You can obtain a comprehensive look at all of the data that are related to invoices.

To see all of the records related to a particular invoice, select the View Related Records action.

To view the transactions and the records that are specific to an invoice line, click the View Related Records icon at the end of the invoice line. In the View Related Records window, you can click the identifier for a purchase order, a purchase requisition, a contract, and a request for quotation to access that record in the relevant application.

---

## Working with invoices

You can record invoices as well as debit and credit notes from vendors. You can match invoice details against purchase orders and receipts. You can create invoices for which there are no purchase orders. You can also create consignment payment invoices that are generated when consignment items are used.

- [Creating invoices](#)  
When you create an invoice, you match the invoice information with the purchase orders and the receipt of materials and services. You can also invoice items for which there are no purchase orders. You can also create invoices for consignment items that are held in inventory, and that do not require payment upon receipt.
- [Working with invoice lines](#)  
You can copy purchase order line items, material receipt line items, or service receipt line items to an invoice.
- [Creating and modifying the sequence of terms](#)  
You can associate specific terms and conditions with contracts and records. You can modify how the sequence of terms displays.
- [Adjusting payment schedules](#)  
In the Invoices application, you can adjust the payment schedule set up for a specific contract.

---

## Creating invoices

When you create an invoice, you match the invoice information with the purchase orders and the receipt of materials and services. You can also invoice items for which there are no purchase orders. You can also create invoices for consignment items that are held in inventory, and that do not require payment upon receipt.

---

### Before you begin

You can create an invoice with purchase orders whose sites are different from the site where the invoice is generated. However, the invoice must be associated with the same organization as the purchase order sites. You must have security privileges to the same organization to which the purchase order sites belong. The purchase order must be in Approved, In Progress, or in Closed status.

Before you can create a consignment invoice and add line items to the invoice, the items must first be created as consignment items.

---

### About this task

You can create vendor invoices as you receive them, record debit and credit notes from vendors, and create consignment invoices. Consignment invoices are different from other types of invoices. Consignment invoices are generated only when the consignment items in inventory are used, rather than when the items are received.

---

### Procedure

1. From the toolbar of the Invoices application, click New Invoice.
2. In the Type field, select the type of invoice you are creating.
3. Specify information in the fields of the Invoice tab.
4. If the invoice is associated with a purchase order, in the PO field, type the purchase order number. Lines specific only to that purchase order can be copied to the invoice.
5. If the invoice is not associated with a purchase order, leave the PO field blank, and specify the vendor in the Company field. This step also applies if you want to create an invoice with purchase orders whose sites are different from the site where the invoice is generated.
6. In the G/L Posting Date field, specify a date for the general ledger financial period. If your system administrator specified that the invoice date is used, the G/L Posting Date field is populated with the date from the Invoice Date field. If the value specified is not valid, the value is updated to the start date of the next open financial period. You can specify a different value.
7. On the Invoice Lines tab, click New Row, and add line items as needed. If you manually enter a purchase order line item number, the fields pertaining to that purchase order line item are filled.
8. If you are creating an invoice for consignment items, click Select Consignment Transactions.
9. In the Select Consignment Transactions window, select the transactions that you want to invoice for the vendor that is replenishing the consignment items, and click OK.
10. Save the invoice.

---

### What to do next

After you create an invoice and add line items, the invoice can then be approved and routed to Accounts Payable.

- [Changing the status of invoices](#)  
You can change the status of an invoice as it moves towards completion.
- [Creating invoices with multiple vendors](#)  
You can enter company branches into the system and associate multiple company records with a parent record. You can then use the remit-to information of the parent company on an invoice.
- [Receiving invoices electronically](#)  
You can configure the product to receive invoices electronically and, optionally, have the receipt initiate a workflow process. Suppliers can send an invoice transaction, containing the final payment and cost information, each time a purchase order line item is shipped.

---

## Changing the status of invoices

You can change the status of an invoice as it moves towards completion.

## Before you begin

---

You must have authorization through the Security Groups application to change the status of an invoice.

## About this task

---

When you create an invoice, its status is automatically set to Entered. When you change the status of an invoice to Approved, if the Close PO check box is selected, all purchase orders that are associated with the invoice (for which all receipts are complete and approved) are closed. The system administrator sets purchase order options in the Organizations application.

## Procedure

---

1. In the Invoices application, display the invoice record for which you want to change the status.
2. Select the Change Status action.
3. In the New Status field of the Change Status window, click the drop-down arrow to select a status.
4. Optional: Change the Status Date and specify information about the status change in the Memo field.
5. Optional: Click the Close PO check box to close all purchase orders associated with the invoice for which all receipts are complete and approved. Or, you can clear the Close PO check box if you do not want to close all associated purchase orders for which receipts are complete and approved.
6. Click OK to save your changes.

## What to do next

---

If the invoice has an inspection-required line item, the inspection status of the line item must be complete in the Receiving application before the invoice can be approved.

## Creating invoices with multiple vendors

---

You can enter company branches into the system and associate multiple company records with a parent record. You can then use the remit-to information of the parent company on an invoice.

## Before you begin

---

When you create an invoice specifying a parent company, the look-up list from the PO field contains all the purchase orders for the parent company and for its branch companies. If the PO field in the Invoices application contains a purchase order, the lines of the invoice include the lines from the current purchase order only. If the purchase order has company information, the vendor information from the parent company does not overwrite the vendor information of the purchase order.

## Procedure

---

1. Create a company record for each branch and associate it with the parent record as follows:
  - a. In the Companies application, click New Company.
  - b. In the Parent field, click Detail Menu to select the parent company.
  - c. Click Save Company.
2. Create purchase orders for the parent and branch companies associated with the parent company as follows:
  - a. In the Purchase Orders application, click New Purchase Order.
  - b. In the Company field, click Detail Menu to select either the branch or the parent company.
  - c. On the PO Lines tab, specify line items for the purchase order.
  - d. Click Change Status and change the status of the purchase order to approved (APPR).
  - e. Click Save Purchase Order.
3. Create an invoice that references the parent company as follows:
  - a. In the Invoices application, click New Invoice.
  - b. In the Company field, click Detail Menu to select the parent company.
  - c. On the Invoice Lines tab, click Copy PO Lines. The Copy PO lines window lists line items from all approved purchase orders for the parent company and for its children.
  - d. In the Copy PO lines window, on the PO Lines tab, select the check box next to the line item that you want to copy over to the invoice. You can copy more than one line item at a time.  
You can also select line items from approved purchase orders for the parent company and for its children. To select lines from approved purchase orders, click New Row on the Invoice Lines tab. Type or select a purchase order in the PO field.
  - e. Click OK.
  - f. Click Save Invoice.

## Receiving invoices electronically

---

You can configure the product to receive invoices electronically and, optionally, have the receipt initiate a workflow process. Suppliers can send an invoice transaction, containing the final payment and cost information, each time a purchase order line item is shipped.

## About this task

---

An invoice transaction can only reference one purchase order. When a transaction is received, it is copied to the Invoice table.

## Procedure

---

1. In the Companies application, display the company record from which you want to receive electronic invoices.
2. Select the Vendor Sends Invoice check box.
3. Click Save Company.

---

## Working with invoice lines

You can copy purchase order line items, material receipt line items, or service receipt line items to an invoice.

- [Copying purchase order line items to invoices](#)  
When you create an invoice for a single purchase order, or for multiple purchase orders for a single vendor, you can copy line items to the invoice. You can copy line items for invoices with purchase orders whose sites are different from the site for the invoice. You can also view lines for services or items received that are not on the invoice.
- [Specifying multiple purchase orders on invoices](#)  
You can use the Invoices application to specify multiple purchase orders and their line items on a single invoice. For example, you might have used separate purchase orders to order items from a vendor, and you received all the items in a single shipment with a single invoice from the vendor. You can also specify purchase orders with sites that are different from the site for the invoice.
- [Distributing costs of line items](#)  
You can distribute the costs of an invoice line item across multiple general ledger accounts. For example, suppose your department paid for a laser printer that the packaging department uses. You can specify two general ledger accounts for the printer, one for your department and one for the packaging department.

---

## Copying purchase order line items to invoices

When you create an invoice for a single purchase order, or for multiple purchase orders for a single vendor, you can copy line items to the invoice. You can copy line items for invoices with purchase orders whose sites are different from the site for the invoice. You can also view lines for services or items received that are not on the invoice.

## Before you begin

---

Before copying purchase order line items to an invoice, the following conditions must be met:

- If you are copying line items from purchase orders whose sites are different from the site of the invoice, the organization must be the same for both the purchase orders and the invoice. Additionally, on the Invoice tab, the PO field must be blank, and a vendor must be identified in the Company field in the Remit To section.
- The status of the invoice must be Entered, Waiting for Approval, or Hold.
- If you are copying line items from a single purchase order, either an approved purchase order must be identified in the PO field of the Invoice tab, or a vendor must be identified in the Company field in the Remit To section.
- If the Receipt Required check box is selected on any of the purchase order line items, then the item must be received before the invoice can be approved.

## About this task

---

The default for viewing lines for services or materials is View all lines. This option shows both lines that are invoiced and lines that are not invoiced. When you select this option, the Uninvoiced Qty field and the Uninvoiced Cost field contain a zero for lines that are invoiced. To view lines that are not invoiced, select that option, then click Refresh.

## Procedure

---

1. In the Invoices application, display the invoice record to which you want to copy purchase order lines.
2. In the Invoice Lines tab, click Copy PO Lines. If you identified a purchase order number on the invoice header, the Copy PO Lines window shows line items for that purchase order. If you identified a vendor on the Invoice tab, all purchase order lines on all purchase orders for that vendor display, unless the purchase orders are waiting for approval or are canceled.
3. From the tab window for the type of line item, select the check box for each item that you want to copy.
4. Click View lines that are not invoiced to see the quantity and the cost for lines that are not invoiced. You can view lines in the PO Lines tab, in the Materials tab, and in the Services tab. You can add the uninvoiced lines to the invoice by selecting the check box for those lines.
5. Click OK.
6. Optional: On the Invoice Lines tab, edit line item information fields, such as Quantity or Unit Cost. Additionally, in the Tax Exempt check box, you can override the tax-exempt status that was set for the item or for the service.
7. In the Default Table Data section, specify information for one or more of the fields.
8. Save the invoice.

---

## Specifying multiple purchase orders on invoices

You can use the Invoices application to specify multiple purchase orders and their line items on a single invoice. For example, you might have used separate purchase orders to order items from a vendor, and you received all the items in a single shipment with a single invoice from the vendor. You can also specify purchase orders with sites that are different from the site for the invoice.

---

## About this task

In most cases, you can enter the vendor on the Invoice tab, then use Copy PO Lines on the Invoice Lines tab to copy lines from multiple purchase orders for that vendor. You can also enter invoice lines for line items from multiple purchase orders manually.

---

## Procedure

1. In the Invoices application, display the invoice to which you want to add multiple purchase orders.
2. In the Company field, specify the vendor or click Detail Menu to select a vendor.
3. On the Invoice Lines tab, click New Row.
4. In the PO field, type a valid purchase order number. The same purchase order number might apply to multiple sites.
5. In the remaining fields, specify line item information pertinent to this purchase order. If the purchase order has multiple line items, add a row for each line item.
6. Repeat steps 3 to 5 for each additional purchase order that you want to include on the invoice.
7. Click Save Invoice.

---

## Distributing costs of line items

You can distribute the costs of an invoice line item across multiple general ledger accounts. For example, suppose your department paid for a laser printer that the packaging department uses. You can specify two general ledger accounts for the printer, one for your department and one for the packaging department.

---

## About this task

An invoice line item must be a direct issue item or service item in order to distribute its costs. You cannot distribute costs on purchase order lines that are associated with a storeroom.

---

## Procedure

1. In the Invoices application, display the invoice record for which you want to distribute costs.
2. On the Invoice Lines tab, copy the appropriate purchase order lines to the invoice and click Distribute Costs.
3. In the Distribute Costs window, click New Row.
4. Specify a value in the Percentage field or in the Line Cost field.  
If you type a percentage, the line cost representing that percentage is displayed. If you specify a portion of the line cost, the percentage for that cost displays.
5. In the GL Debit Account field, specify a value or click Select Value to choose from the list.  
The first row in the Distribute Costs table displays the percentage (100%) and the total line cost of the line item that you specified. If you want to distribute costs for the line item, you must edit this row.
6. Continue to enter rows until the sum of the Percentage fields equal 100%.
7. Click OK.
8. Click Save Invoice.  
The Distributed check box is selected to indicate that the record contains line items with distributed costs.

---

## Creating and modifying the sequence of terms

You can associate specific terms and conditions with contracts and records. You can modify how the sequence of terms displays.

- [Creating terms](#)  
You can create terms and conditions that can later be associated with a contract or purchasing record. Terms and conditions can contain information such as: liability concerns, shipping and handling details, and delivery time expectations.
- [Modifying the sequence of terms for records](#)  
You can change the order in which the terms for a record display. You can modify the sequence to display a more logical order, or to list certain terms sequentially.

---

## Creating terms

You can create terms and conditions that can later be associated with a contract or purchasing record. Terms and conditions can contain information such as: liability concerns, shipping and handling details, and delivery time expectations.

---

## Before you begin

Terms and conditions can only be added to purchasing or contracts records set at statuses in progress or waiting on approval.

## Procedure

---

1. In a purchasing or contract application, display the record for which you want to create a term.
2. On the Terms and Conditions tab, click New Row.
3. Specify the sequence and term.
4. Optional: Select the Send to Vendor check box.
5. Save the record.

## What to do next

---

You can set default term and condition values according to site and contract type in the Organizations application. When you create a contract record in a contracts application, the contract inherits the default term and condition values that you assigned to the selected contract type in the Organizations application.

## Modifying the sequence of terms for records

---

You can change the order in which the terms for a record display. You can modify the sequence to display a more logical order, or to list certain terms sequentially.

## Procedure

---

1. In the appropriate Purchasing or Contract application, display the record with which you want to associate a term.
2. Click the Terms and Conditions tab.
3. In the Terms and Conditions table window, locate the rows for which you want to change the sequence.
4. In the Sequence column for the appropriate rows, specify a value. You can enter any integer up to 9999. The product defaults the sequence numbers to multiples of 10. You can rearrange the order without renumbering the entire sequence.
5. Click Save.

## Adjusting payment schedules

---

In the Invoices application, you can adjust the payment schedule set up for a specific contract.

## Before you begin

---

The invoice record must have a status of Scheduled (SCHED).

## About this task

---

Invoices with a status of Scheduled can be created only from the Contracts application. An invoice with a status of Scheduled can be changed to any status except Entered.

## Procedure

---

1. In the Invoices application, display the invoice record containing the payment schedule that you want to change.
2. From the toolbar, change the status of the invoice to Waiting on Approval (WAPPR).
3. Click the Invoice tab, and change the due date, the invoice cost information, the quantity, and other details, as needed. You can also add terms and conditions to the invoice from the Terms and Conditions tab.
4. Click Save Invoice.

## Request for Quotations

---

You use the Request for Quotations application to create requests for quotations and to store the quotations. Based on the quotations, you can assess the vendor who best meets your needs.

A Request for Quotations is a request that you send out to one or more potential vendors. To list a vendor on the Request for Quotations, the vendor must have a record in the Companies application. In the Request for Quotations application, you can specify line items, required delivery dates, and other conditions that you want the vendor to meet for the delivery of an item or a service.

You can create an Request for Quotations for any of the following conditions:

- The stock count of an item drops below a certain level, and you must place another bulk order.
- A requisition is received for an item or for a service that requires a quotation each time because of item price or other requirements.
- Someone at your site requests a quote for an item or for a service. It can be for a stocked item or for a non-stocked item, such as a special order.
- You need to do commodity bulk buying for a certain period of time. This is typically for many items with common commodity codes. The quotation might not be copied to a purchase order immediately, but the pricing is set.

When you receive the quotations from the vendors, you insert them into the Request for Quotations record one line at a time. At the end of the process, you review the quotations and award one quotation for each line. The quotations are then converted to one or more purchase orders or contracts, depending on the

procurement flow within your organization.

- [Request for quotations overview](#)  
Creating requests for quotations (RFQs) is the first step in the purchasing process. You can specify line items, required delivery dates, and other conditions that you want the vendor to meet for the delivery of an item or a service.
- [Working with requests for quotations](#)  
A Request for Quotations is a request that you send out to one or more potential vendors. ---

## Request for quotations overview

Creating requests for quotations (RFQs) is the first step in the purchasing process. You can specify line items, required delivery dates, and other conditions that you want the vendor to meet for the delivery of an item or a service.

- [Purchasing process](#)  
The steps in the purchasing process include creating purchase requisitions, creating purchase orders, receiving services and items, and recording vendor invoices.
- [Request for Quotations statuses](#)  
Changing statuses on Request for Quotations affects both field functionality and access to various action pages.
- [Terms and conditions](#)  
You can create and maintain a library of terms and conditions that your company and your vendors must follow on purchase order and contract transactions. Terms and conditions can contain information such as: liability concerns, shipping and handling details, and delivery time expectations.

---

## Purchasing process

The steps in the purchasing process include creating purchase requisitions, creating purchase orders, receiving services and items, and recording vendor invoices.

The following example illustrates the purchasing process from requisitioning through invoicing.

---

### Step 1: Create the purchase requisition

You can create and approve a purchase requisition 98074 for the following services and related materials:

- Two contract programmers (1,000 hours each)
- Two personal computers
- A software package
- Rental furniture (desks, chairs)

---

### Step 2: Create the purchase orders

You can create the following purchase orders, one for each vendor by using the Copy PR Line Items to PO action in the Purchase Orders application:

- Purchase order 98105 that contains two contract programmers (1,000 hours each)
- Purchase order 98106 that contains two personal computers
- Purchase order 98107 that contains a software package
- Purchase order 98108 that contains rental furniture (desks, chairs)

---

### Step 3: Receive the services and items

When you record receipts from each vendor, you must use the appropriate receipts tab in the Receiving application and the Select Ordered Services and Select Ordered Items actions.

---

### Step 4: Record vendor invoices

After you purchase materials and services, your company receives bills, or invoices, from the vendors. You use the Invoices application to record vendor invoices as you receive them. When you create invoice records you can list purchase order details on the invoice when it is appropriate.

You use the Copy PO Lines action to copy lines from either the receipts or the purchase order to the Invoice Lines tab. You can also view lines that are not on the invoice for items or services received, and add the lines to the invoice.

---

## Request for Quotations statuses

Changing statuses on Request for Quotations affects both field functionality and access to various action pages.

The following statuses apply to Requests for Quotations:

In Progress (INPRG)

The default status when you create a Request for Quotations. The Request for Quotations must remain in INPRG status until you have specified all information and line items. In this status, you can modify most tabs and fields on the Request for Quotations, except for the Quotation Lines table. The Request for Quotations must be saved as INPRG before changing it to another status. The status INPRG is always available (except in COMPLETE and CLOSED status) to allow you to edit the Request for Quotations.

**Ready to be Sent (READY)**

Indicates that the Request for Quotations is ready to be sent to the vendors. In this status, you cannot change the Request for Quotations. All tabs are read-only.

**Sent to the Vendor (SENT)**

Indicates that the Request for Quotations has been sent to the vendors. The SENT status causes fields on the RFQ tab and on the RFQ Lines tab to be read-only. Fields on the Vendors tab can be modified. You can also modify the fields on the Quotations tab, and on the Terms and Conditions tab.

**Completed (COMP)**

Indicates that all quotations have been received from the vendors. In this status, all fields, except for the fields on the Quotation Lines tab, and the fields on the Terms and Conditions tab, are read-only.

**Canceled (CANCEL)**

Indicates a canceled Request for Quotations. You use this status to cancel a Request for Quotations, or to cancel a selected set of Requests for Quotations. You can cancel a Request for Quotations only if no quotations have been awarded. The CANCEL status is not available after a quotation has been converted to a purchase order. A canceled Request for Quotations is stored as a history record and cannot be modified.

**Closed (CLOSE)**

Indicates a closed Request for Quotations. The Request for Quotations must be one whose quotation lines have been awarded. Once a Request for Quotations is closed, it is stored as a history record and cannot be modified.

---

## Terms and conditions

You can create and maintain a library of terms and conditions that your company and your vendors must follow on purchase order and contract transactions. Terms and conditions can contain information such as: liability concerns, shipping and handling details, and delivery time expectations.

You can create a library of term and condition values in the Terms and Conditions application. You use the library to look up and associate terms and conditions to purchase order and contract records. The library is accessible in the Purchase Orders and contracts applications.

You can set default term and condition values according to site and contract type in the Organizations application. When you create a contract record in a contracts application, it inherits the default term and condition values that you assigned to the selected contract type in the Organizations application.

---

## Working with requests for quotations

A Request for Quotations is a request that you send out to one or more potential vendors. You receive the quotations from the vendors, record the quotations they provide, review the quotations, and award one quotation for each line item. Quotations are converted into one or more purchase orders or contracts.

- [Creating Requests for Quotations](#)  
You create a Request for Quotations when you want potential vendors to provide quotations for items or services.
- [Copying line items from purchase requisitions to Requests for Quotations](#)  
You can copy one or more line items from a purchase requisition to a Request for Quotations. This action provides a quick way to enter line items without manually entering all the detail information.
- [Creating, associating, and modifying terms](#)  
You can create terms and conditions for records and you can associate existing terms with records. You can also modify how the sequence of terms displays for a record.
- [Creating units of measure](#)  
You can create a unit of measure to describe the quantity used to measure an item, tool, or a service. You use a unit of measure to measure the items and services that you order, issue, and transfer in the asset management system. Examples of units of measure include EACH, CASE, IN (inches), and ROLL.
- [Creating conversion factors](#)  
You can create a conversion factor to define the numeric value or ratio that the asset management system uses to relate one unit of measure to another. The conversion factor is an alternate value that is used to represent a unit of measure. You can use this alternate value to define an item order or transfer quantity and storeroom balance.

---

## Creating Requests for Quotations

You create a Request for Quotations when you want potential vendors to provide quotations for items or services.

---

### About this task

Quotations supplied by vendors must provide you with pricing and other line- item-specific information, such as manufacturer and delivery time. When you have quotations in hand, you can add them to the Quotation Lines table on the Quotations tab. You can then compare the quotations before awarding line items to vendors and before creating purchase orders.

When you create a Request for Quotations, the status defaults to INPRG (In Progress).

---

### Procedure

1. Click New RFQ.
2. If the RFQ field is empty, specify a value. If the RFQ field contains an identifier, you can modify the value.

3. Optional: Type a description.
4. Specify Request for Quotations details, such as dates, terms, ship to information, and reply to information.
5. Click Save RFQ.

- **[Creating Requests for Quotations from purchase requisitions](#)**

You can create a Request for Quotations from a purchase requisition. The lines from the purchase requisition appear as line items in the Request for Quotations.

- **[Adding Request for Quotations line items](#)**

You can add line items to Requests for Quotations.

- **[Adding vendors to Requests for Quotations](#)**

When you create a Request for Quotations, you list the vendors to whom you will send the Request for Quotations.

- **[Adding quotation lines](#)**

After you receive the responses from vendors from whom you requested quotations, you can add the quotations into the record. Adding the quotation lines provides a complete record of the quotations from all of the vendors. You can then compare the quotations and award the line items based on the comparisons.

- **[Associating terms with vendors](#)**

In the Request for Quotations, you can associate terms from the Terms and Conditions library with a specific vendor. The library contains terms and conditions with which you and your vendors must comply.

---

## Creating Requests for Quotations from purchase requisitions

You can create a Request for Quotations from a purchase requisition. The lines from the purchase requisition appear as line items in the Request for Quotations.

---

### Procedure

1. From the toolbar of the Request for Quotations application, click New RFQ.
2. Select the Copy PR Line Items to RFQ action. Purchase requisition line items that have not been copied to purchase orders or contracts, and are not indicated as Copy to Contract appear in this window. Use the search fields to filter the line items you want to see. For example, you can enter a purchase requisition number in the PR field and click Find, to show only the line items from that purchase requisition.
3. Select one or more rows on the Copy PR Line Items to RFQ window.
4. Click OK.
5. Optional: Specify more Request for Quotations line items. You can modify the lines copied from the purchase requisition.
6. Click Save RFQ.

---

## Adding Request for Quotations line items

You can add line items to Requests for Quotations.

---

### Before you begin

You can add line items if the Request for Quotations has a status of In Progress (INPRG).

---

### Procedure

1. From the Request for Quotations application, display the record to which you want to add lines.
2. Click the RFQ Lines tab.
3. Click New Row.
4. Specify a value in the Item field, or click the Detail Menu to select an option. If the line item is for a service, type a description and select the Service check box.
5. Type line item information in the fields.
6. Click Done.
7. Optional: Click New Row to add additional line items and follow steps 4 to 6.
8. Click Save RFQ.

---

## Adding vendors to Requests for Quotations

When you create a Request for Quotations, you list the vendors to whom you will send the Request for Quotations.

---

### Before you begin

If you want to add quotations from vendors on the Quotations tab, you must first specify the vendors before changing the status to SENT. Additionally, to add vendors, the status of the Request for Quotations must be INPRG (In Progress).

---

### Procedure

1. From the Request for Quotations application, display the Request for Quotations to which you want to add a vendor.
2. Click the Vendors tab.
3. Perform the following steps for all vendors that you want to add:
  - a. Click New Row.
  - b. To select a vendor, specify a value in the Vendor field.
  - c. Modify vendor information to make it specific to this Request for Quotations. Any changes to vendor information you type do not change the record for the vendor in the Companies application. To change vendor information permanently, edit the company information in the Companies application.
  - d. In the Terms and Conditions for Vendor table window, select terms for the vendor.
4. Click Done, and click Save RFQ.

---

## Adding quotation lines

After you receive the responses from vendors from whom you requested quotations, you can add the quotations into the record. Adding the quotation lines provides a complete record of the quotations from all of the vendors. You can then compare the quotations and award the line items based on the comparisons.

---

### Before you begin

You can add quotation lines only if the status of the Request for Quotations is either SENT (Sent to the Vendor) or COMP (Completed).

---

### About this task

You can specify quotation information for a line on either the Vendor tab or on the Item tab. However, you can initially add the quotation lines only by using the Select RFQ Lines button on the Vendor sub tab.

A quotation from a vendor shows in the currency of the vendor. The cost of the quotation line also shows in the base currency. You can then compare the cost of the item from all vendors from whom you received quotations. When you change the currency of a line, the unit cost, the line cost, and the tax amount display in the base currency.

---

### Procedure

1. From the Request for Quotations application, display the record that you want to edit.
2. Click the Quotations tab.
3. On the Vendors sub tab, select the vendor whose quotations you want to add.
4. Click Select RFQ Lines. The Select RFQ Lines window shows all lines that have not been copied to the Quotations for Vendor table for the currently selected vendor.
5. Select one or more lines to copy, or select the topmost check box to select all lines.
6. Click OK.

---

## Associating terms with vendors

In the Request for Quotations, you can associate terms from the Terms and Conditions library with a specific vendor. The library contains terms and conditions with which you and your vendors must comply.

---

### Procedure

1. From the Request for Quotations application, display the record to which you want to associate terms.
2. Click the Vendors tab.
3. In the RFQ Vendors table window, click View Details for the vendor with whom you want to associate terms.
4. In the Row Details window, click Select Terms.
5. Select the check boxes next to the terms that you want to associate with the record and click OK.
6. Click Save RFQ.

---

## Copying line items from purchase requisitions to Requests for Quotations

You can copy one or more line items from a purchase requisition to a Request for Quotations. This action provides a quick way to enter line items without manually entering all the detail information.

---

### Before you begin

The Request for Quotations must be in INPRG (In Progress) status before you can add line items to it from a purchase requisition.

---

### About this task

If a vendor is associated with a line that is copied, the vendor is added to the list of vendors for that Request for Quotations.

## Procedure

---

1. From the Request for Quotations application, display the Request for Quotations to which you want to add line items.
2. Select the Copy PR Line Items to RFQ action. Purchase requisition line items that have not been copied to purchase orders or contracts, and are not indicated as Copy to Contract appear in this window.
3. From the Copy PR Line Items to RFQ window, select the check box for each line item that you want to copy.
4. Click OK.
5. Specify more Request for Quotations line items. You can modify the lines copied from the purchase requisition.
6. Click Save RFQ.

- [Copying lines for selected vendors](#)

You can copy any Request for Quotations lines or all Request for Quotations lines for selected vendors.

- [Awarding quotation lines](#)

You can award quotation line items to different vendors. You can also award all quoted line items to a single vendor.

- [Deleting quotation lines from Requests for Quotations](#)

You can delete quotation lines from Requests for Quotations.

- [Creating purchase orders for quotation lines](#)

After you award quotation lines to a vendor, you can create a purchase order for that vendor for those line items.

---

## Copying lines for selected vendors

You can copy any Request for Quotations lines or all Request for Quotations lines for selected vendors.

## Before you begin

---

You can copy quotation lines only if the Request for Quotations has a status of SENT (Sent to Vendor) or COMP (Completed).

## About this task

---

A quotation from a vendor shows in the currency of the vendor. The cost of the quotation line also shows in the base currency. You can then compare the cost of the item from all vendors from whom you received quotations. When you change the currency of a line, the unit cost, the line cost, and the tax amount display in the base currency.

## Procedure

---

1. From the Request for Quotations application, display the record to which you want to copy quotation lines.
2. Click the Quotations tab.
3. In the Vendor field on the Vendor sub tab, click the name of the vendor for whom you want to insert one or more quotations.
4. Click Select RFQ Lines. The Select RFQ Lines window opens. The window shows all lines that have not been copied to the Quotations for Vendor table for the selected vendor.
5. In the Select RFQ Lines window, select the check box for one or more lines to copy, or select the topmost check box to select all of the lines.
6. Click OK.
7. Provide quotation information, such as unit cost and manufacturer, for the copied lines. You can also award quotation lines.

---

## Awarding quotation lines

You can award quotation line items to different vendors. You can also award all quoted line items to a single vendor.

## Before you begin

---

To add vendors, the Request for Quotations status must be INPRG (In Progress). To enter quotations from vendors in the future, you must first specify the vendors on the Vendors tab before changing the status to SENT (Sent to Vendor).

## Procedure

---

1. From the Request for Quotations application, display the Request for Quotations to which you want to award quotation lines.
2. Click the Quotations tab.
3. Depending on how you want to reference a contract, do one of the following:
  - To award individual line items to a vendor:
    - On the Vendor sub tab, click the name of the vendor to whom you want to award one or more quotation lines.
    - In the Quotations for Vendor table, click the line item that you want to award to the vendor.
    - Select the Awarded check box to award that line item to the vendor.
    - Specify the unit cost of the line item.
    - Click Save RFQ.
  - To award all quoted line items to a vendor:
    - On the Vendor sub tab, click the name of the vendor to whom you want to award all quoted lines.
    - In the Quotations for Vendor table, click Award All. Clicking Award All awards all line items quoted by the vendor that have not already been awarded to another vendor. This action does not award all line items on the Request for Quotations.

- Specify the unit cost of each of the line items.
- Click Save RFQ.

---

## Deleting quotation lines from Requests for Quotations

You can delete quotation lines from Requests for Quotations.

### About this task

---

You cannot delete quotation lines if either of the following conditions exists:

- The quotation lines have been copied to a purchase order.
- The Request for Quotations has a CLOSED status.

### Procedure

---

1. From the Request for Quotations application, display the record that you want to edit.
2. Click the Quotations tab.
3. On the Vendors sub tab, in the Quotations for Vendor table window, click Mark Row for Delete for the quotation line that you want to delete.
4. Optional: Repeat step 3 for each quotation line for each vendor.
5. Click Save RFQ.

---

## Creating purchase orders for quotation lines

After you award quotation lines to a vendor, you can create a purchase order for that vendor for those line items.

### Before you begin

---

Requests for Quotations must be either in SENT (Sent to the Vendor) status or in COMP (Completed) status. You can then award quotation lines and create a purchase order.

### Procedure

---

1. From the Request for Quotations application, display the Request for Quotations for whom you want to create a purchase order.
2. Click the Quotations tab.
3. Perform the following steps for each vendor for whom you want to create a purchase order:
  - a. On the Vendor sub tab, click View Details next to the vendor name.
  - b. Optional: Award quotation lines to the selected vendor. Each line you award must have a unit cost.
  - c. Click Create PO.
  - d. Specify a purchase order number, or click Autonumber.
  - e. Optional: Type a description.
  - f. Click OK.

---

## Creating, associating, and modifying terms

You can create terms and conditions for records and you can associate existing terms with records. You can also modify how the sequence of terms displays for a record .

- **Creating terms**  
You can create terms and conditions that can later be associated with a contract or purchasing record. Terms and conditions can contain information such as: liability concerns, shipping and handling details, and delivery time expectations.
- **Associating existing terms with records**  
You can associate terms and conditions with records to define the rules that your company and your vendors must follow on purchase order and contract transactions.
- **Modifying the sequence of terms for records**  
You can change the order in which the terms for a record display. You can modify the sequence to display a more logical order, or to list certain terms sequentially.
- **Creating terms**  
You can create terms and conditions that can later be associated with a contract or purchasing record. Terms and conditions can contain information such as: liability concerns, shipping and handling details, and delivery time expectations.
- **Associating existing terms with records**  
You can associate terms and conditions with records to define the rules that your company and your vendors must follow on purchase order and contract transactions.
- **Modifying the sequence of terms for records**  
You can change the order in which the terms for a record display. You can modify the sequence to display a more logical order, or to list certain terms sequentially.

---

## Creating terms

You can create terms and conditions that can later be associated with a contract or purchasing record. Terms and conditions can contain information such as: liability concerns, shipping and handling details, and delivery time expectations.

### Before you begin

---

Terms and conditions can only be added to purchasing or contracts records set at statuses in progress or waiting on approval.

### Procedure

---

1. In a purchasing or contract application, display the record for which you want to create a term.
2. On the Terms and Conditions tab, click New Row.
3. Specify the sequence and term.
4. Optional: Select the Send to Vendor check box.
5. Save the record.

### What to do next

---

You can set default term and condition values according to site and contract type in the Organizations application. When you create a contract record in a contracts application, the contract inherits the default term and condition values that you assigned to the selected contract type in the Organizations application.

---

## Associating existing terms with records

You can associate terms and conditions with records to define the rules that your company and your vendors must follow on purchase order and contract transactions.

### About this task

---

The Terms and Conditions application maintains a library of terms and conditions with which you and your vendors must comply. You can select terms from this library to apply to contract and purchasing records.

### Procedure

---

1. In a purchasing or contract application, display the record for which you want to select a term.
2. On the Terms and Conditions tab, click Select Terms.
3. Select the Select Record check box next to each term that you want to associate with the record.
4. Click OK.
5. Optional: Select the term in the Terms and Conditions table window and select the Send to Vendor check box.
6. Save the record.

---

## Modifying the sequence of terms for records

You can change the order in which the terms for a record display. You can modify the sequence to display a more logical order, or to list certain terms sequentially.

### Procedure

---

1. In the appropriate Purchasing or Contract application, display the record with which you want to associate a term.
2. Click the Terms and Conditions tab.
3. In the Terms and Conditions table window, locate the rows for which you want to change the sequence.
4. In the Sequence column for the appropriate rows, specify a value. You can enter any integer up to 9999. The product defaults the sequence numbers to multiples of 10. You can rearrange the order without renumbering the entire sequence.
5. Click Save.

---

## Creating units of measure

You can create a unit of measure to describe the quantity used to measure an item, tool, or a service. You use a unit of measure to measure the items and services that you order, issue, and transfer in the asset management system. Examples of units of measure include EACH, CASE, IN (inches), and ROLL.

### About this task

---

A unit of measure works with a conversion factor. The conversion factor represents the numeric value or ratio that the asset management system uses to relate one unit of measure to another. You can create units of measure and conversion factors in many applications:

- Assets
- Purchase Orders
- Purchase Requisitions
- Receiving
- Item Master
- Meters
- Service Items
- Tools
- Stocked Tools
- Inventory

You can delete a unit of measure only when it is not used in a conversion, on a specification template, or on a meter record.

## Procedure

---

1. Open an application.
  2. Select the Unit of Measure and Conversion > Add/Modify Units of Measure action.
  3. Insert a row.
  4. In the Unit of Measure field, specify an identifier for the unit of measure.
  5. Optional: Enter values in the following fields:
    - Abbreviation
    - Description
- The abbreviation value along with an asset classification is used to create descriptions for assets, locations, and items.
6. Click OK.

---

## Creating conversion factors

You can create a conversion factor to define the numeric value or ratio that the asset management system uses to relate one unit of measure to another. The conversion factor is an alternate value that is used to represent a unit of measure. You can use this alternate value to define an item order or transfer quantity and storeroom balance.

## Before you begin

---

You must define the units of measure before you can create conversion ratios.

## About this task

---

You can create units of measure and conversion factors in the following applications:

- Purchase Orders
- Purchase Requisitions
- Receiving
- Item Master
- Service Items
- Tools
- Stocked Tools
- Inventory

## Procedure

---

1. Open an application.
  2. Select the Unit of Measure and Conversion > Add/Modify Conversions action.
  3. Click New Row.
  4. Enter values in the following fields:
- | Option                      | Description                                                                                           |
|-----------------------------|-------------------------------------------------------------------------------------------------------|
| <b>From Unit of Measure</b> | The original unit of measure value that you are converting from in the conversion factor calculation. |
| <b>To Unit of Measure</b>   | The unit of measure value that you are changing or replacing in the conversion factor calculation.    |
| <b>Conversion Factor</b>    | The ratio that is applied to relate one unit of measure to another.                                   |
5. Optional: In the Item Number field, enter the item number that is associated to the conversion.
  6. Click OK.

---

## Companies

The Companies application maintains detailed information about vendors, manufacturers, and other companies.

Vendors can have parent companies. There can be multiple vendor locations for a single company. Using reports, you can determine total year-to-date expenditures with a single organization, regardless of its location. Company information must be entered in the Companies application first so that other modules, such as Inventory and Purchasing, can access the information.

With the Companies application, you can perform the following tasks:

- You can associate commodity codes with a vendor.
- You can add a commodity group to the database.
- You can add or modify a commodity code in a commodity group.
- You can bookmark a record so that I can view it at a later time.
- You can create a company record.
- You can delete a record.
- You can duplicate a record.
- You can view contract information related to the company.
- [Companies overview](#)  
You can maintain detailed information about vendors, manufacturers, and other companies such as associating branches with companies, disqualifying vendors, and deleting company records.
- [Working with companies](#)  
You can create company records detailing purchasing and payment details, associate branches, and associate commodities for vendor, manufacturing, and other companies.

---

## Companies overview

You can maintain detailed information about vendors, manufacturers, and other companies such as associating branches with companies, disqualifying vendors, and deleting company records.

- [Company branches](#)  
Your company might purchase products or services through a national vendor with local offices. If your company has locations in different cities, each location might purchase goods from the local office of the vendor.
- [Vendor disqualification](#)  
If your company decides no longer to do business with a vendor, you can mark the record to indicate that the vendor is disqualified.
- [Deletion of company records](#)  
You can delete a company record in the Companies application.

---

## Company branches

Your company might purchase products or services through a national vendor with local offices. If your company has locations in different cities, each location might purchase goods from the local office of the vendor.

You can create branch records for a vendor company so that you can track purchasing either at the branch level, or with the vendor as a whole.

---

## Branch hierarchies

The branch hierarchy can only be one level deep, with a parent company record and child branch records. Child records cannot be parents of other records. Parent records cannot be children of other records.

---

## Vendor disqualification

If your company decides no longer to do business with a vendor, you can mark the record to indicate that the vendor is disqualified.

After you disqualify a vendor, you can no longer create new purchase requisitions, purchase orders, requests for quotations, or invoices for the vendor.

A disqualified vendor affects only those records created after you disqualified the vendor.

---

## Deletion of company records

You can delete a company record in the Companies application.

The following rules apply to the deletion of company records:

- Company records that have been referenced in other applications (such as Purchase Orders, Invoices, and Contracts) might not be deleted.
- Company records that have associated branch records might not be deleted. To delete a company record with associated branch records, you must first sever all the branch associations with that company record.

By deleting a branch from a company record, you are removing the association of the branch with the company record. The branches that you delete remain in the database.

---

## Working with companies

You can create company records detailing purchasing and payment details, associate branches, and associate commodities for vendor, manufacturing, and other companies.

- [Creating company records](#)  
A company record contains organization-specific information about vendors, such as contact names and addresses.
- [Creating commodity groups](#)  
You can create a commodity group to identify a grouping of items, tools, or services. A commodity group contains a grouping of individual commodity codes. Classifying items, tools, services with commodity groups and commodity codes provides a way for you to analyze spending by product type. You first define a commodity group and then add and associate individual commodity codes to the group.
- [Associating commodities with company records](#)  
Classifying items, tools, services with commodity groups and commodity codes provides a way for you to analyze spending by product type. Associating commodity groups and codes with a company record helps you to analyze spending by company.
- [Copying company records](#)  
You can duplicate an existing company record. Upon duplication, a copy of the existing record is created with the same values except for the Company field that is left blank.
- [Associating branches with company records](#)  
You can associate branches with a company record. You can also specify whether you want payment information from the parent record to be used on invoices created against the branch.

---

## Creating company records

A company record contains organization-specific information about vendors, such as contact names and addresses.

### About this task

---

If a company has multiple locations, you can create separate records for each branch location and associate the records with a parent company record. Company information must be entered in the Companies application first so that other applications, such as Inventory and Purchasing, can access the information.

### Procedure

---

1. On the toolbar of the Companies application, click New Company. If the Company field is empty, specify a value.
2. If the company has a parent, specify a value in the Parent field or click Detail Menu to select an option and retrieve a value.  
Adding a name to the Parent field associates the company with the parent.
3. In the Description field, type a description of your company.
4. In the Company Type field, specify the type of company.  
The company types are the following:
  - Courier - transit company
  - Manufacturer - manufacturer of items or assets
  - Vendor - vendor of items or assets
  - Internal - an entity within your organization that provides items or services within your organization.
5. Specify the currency that the company uses.
6. Optional: Specify details about the purchasing and payment.
7. Click Save Company.

---

## Creating commodity groups

You can create a commodity group to identify a grouping of items, tools, or services. A commodity group contains a grouping of individual commodity codes. Classifying items, tools, services with commodity groups and commodity codes provides a way for you to analyze spending by product type. You first define a commodity group and then add and associate individual commodity codes to the group.

### About this task

---

Once you have defined commodities you can associate them with company, contract, and item records. You can also associate commodities with individual purchase order or requisition lines for items, service items, or tools that do not have commodity codes assigned to them, including special order materials or services.

You can create commodity groups and codes in the following asset management system applications:

- Companies
- Item Master
- Purchase Orders
- Service Items
- Tools

### Procedure

---

1. Open an application.
2. Select the Add/Modify Commodity Codes action.
3. In the Commodity Groups table window, click New Row.
4. In the Commodity Group field, enter an identifier for the commodity group.
5. Specify whether you want a service type item or service level agreement to use this commodity group.

Option	Service
Use commodity group	Selected
Do not use commodity group	Cleared

6. In the Commodity Codes for Commodity Group table window, click New Row.
7. In the Commodity Code field, enter an identifier for the commodity.
8. Specify whether you want a service type item or service level agreement to use this commodity code.

Option	Service
Use commodity code	Selected
Do not use commodity code	Cleared

9. Click OK.

---

## Associating commodities with company records

Classifying items, tools, services with commodity groups and commodity codes provides a way for you to analyze spending by product type. Associating commodity groups and codes with a company record helps you to analyze spending by company.

---

### Procedure

1. In the Companies application, display the record with which you want to associate commodities.
2. Select the Associate Commodities action.
3. In the Associate Commodities window, perform one of the following actions to select commodities:

Option	Description
To select multiple commodities	Click Select Commodities Groups or Select Commodity Codes. Select the commodities you want and click OK.
To select a single commodity	Click New Row in either the Commodity Groups section or in the Commodity Codes for Company Group section. In the Commodity Group/Commodity Code field, type an existing identifier or click Select Value.

4. Click OK.

---

## Copying company records

You can duplicate an existing company record. Upon duplication, a copy of the existing record is created with the same values except for the Company field that is left blank.

---

### About this task

If your system administrator selected the Automatically Add Companies to Company Master check box in the Sets application, you can duplicate an existing company record in the Companies application. If not, use the Company Master application to duplicate the record. Selecting the Automatically Add Companies to Company Master check box also creates a company master record each time you duplicate an existing company record.

---

### Procedure

1. In the Companies application, display the record you want to duplicate.
2. Select the Duplicate Company action.
3. In the Company field, type an identifier.
4. Optional: Modify other fields.
5. Click Save Company.

---

## Associating branches with company records

You can associate branches with a company record. You can also specify whether you want payment information from the parent record to be used on invoices created against the branch.

---

### Procedure

1. Display the record to which you want to add branches. Click the Branches tab.
2. In the Branches table window, type a company name.  
Adding a name to the Parent field associates the company with the parent.
3. Select the Use Parent Remit To check box if you want the payment information from the parent record to be used on invoices created against the branch.
4. Click Save Company.

---

## Company Master

You use the Company Master application to create company master records that belong to a particular company set. You can also use the Company Master application to associate a company master record with an organization.

Company master records contain information pertaining to companies, such as the default contact person for the company. Company master records also contain purchasing details and payment details for the company.

With the Company Master application, you can perform the following tasks:

- Add a company master record to an organization
- Bookmark a record so that you can view it at a later time
- Create a company master record
- Delete a record

Note that if a company master record is associated with an organization, you cannot delete the record.

All company master records in the database belong to a company set. With company sets, you can share information about companies between multiple organizations. Each organization is associated with a company set.

- [Creating company master records](#)  
Company master records maintain detailed information about companies that belong to a particular company set. Company master records contain information such as contact information for the company, the purchasing details, and payment details.
- [Adding company master records to organizations](#)  
After you have created a company master record, you must add the record to one or more organizations. You cannot delete a company master record that is already associated with an organization.

---

## Creating company master records

Company master records maintain detailed information about companies that belong to a particular company set. Company master records contain information such as contact information for the company, the purchasing details, and payment details.

---

### Procedure

1. From the toolbar of the Company Master application, click New Company Master. If the Company field is empty, specify a value.
2. Specify a description of the company.
3. Specify the type of company.
4. Specify the currency that the company uses.
5. Optional: In the Customer # field, specify a number to be used by outside companies to uniquely identify your company.
6. In the Company Type field, specify a value or click Select Value.
7. Specify the contact information, such as phone, fax, and e-mail.
8. Specify the contact address information and remit-to-company address information.
9. Click Save Company Master.

---

### What to do next

After you have created a company master record, you need to add the record to one or more organizations.

---

## Adding company master records to organizations

After you have created a company master record, you must add the record to one or more organizations. You cannot delete a company master record that is already associated with an organization.

---

### Procedure

1. From the Company Master application, display the record to which you want to add to an organization.
2. Select the Add Company Master to Organization action.  
After a company master record has been added to an organization, that organization will not be listed in the Add Company Master to Organizations window the next time you access it with the same company master record selected. In other words, for any company master record, only those organizations that use the same company set and have not had that master record added to them are displayed.
3. Select the check box for each organization to which you want to add the record.
4. Click OK.

---

## Terms and Conditions

You use the Terms and Conditions application to specify and to maintain a library of terms and conditions. You can add the terms and conditions to a purchasing document or to a contract. Terms can contain information such as liability concerns, shipping and handling details, and delivery time expectations.

The terms entered in the Terms and Conditions application are available from tabs in the purchasing and contract applications. From the tabs, you can select a term from the library to associate with a purchasing record or with a contract record.

- [Terms and conditions overview](#)  
Terms and conditions can contain information such as liability concerns, shipping and handling details, and delivery time expectations. You can create term types which can be associated with terms and conditions.
- [Working with terms and conditions](#)  
You can define and delete terms and conditions that can be used in the purchasing and contracts applications. You can associate terms and conditions with purchase order and contract records to determine the rules that your company and your vendors must follow on purchase order and contract transactions.
- [Terms and conditions overview](#)

---

## Terms and conditions overview

Terms and conditions can contain information such as liability concerns, shipping and handling details, and delivery time expectations. You can create term types which can be associated with terms and conditions.

- [Terms and conditions](#)  
You can create and maintain a library of terms and conditions that your company and your vendors must follow on purchase order and contract transactions. Terms and conditions can contain information such as: liability concerns, shipping and handling details, and delivery time expectations.
- [Term types](#)  
A term type is a user-defined value that is associated with a term in the Terms and Conditions application. The term type allows you to filter all records in the Terms and Conditions library by searching on the Type field. Defining a term type is optional.
- [Terms and conditions](#)  
You can create and maintain a library of terms and conditions that your company and your vendors must follow on purchase order and contract transactions. Terms and conditions can contain information such as: liability concerns, shipping and handling details, and delivery time expectations.
- [Term types](#)  
A term type is a user-defined value that is associated with a term in the Terms and Conditions application. The term type allows you to filter all records in the Terms and Conditions library by searching on the Type field. Defining a term type is optional.

---

## Terms and conditions

You can create and maintain a library of terms and conditions that your company and your vendors must follow on purchase order and contract transactions. Terms and conditions can contain information such as: liability concerns, shipping and handling details, and delivery time expectations.

You can create a library of term and condition values in the Terms and Conditions application. You use the library to look up and associate terms and conditions to purchase order and contract records. The library is accessible in the Purchase Orders and contracts applications.

You can set default term and condition values according to site and contract type in the Organizations application. When you create a contract record in a contracts application, it inherits the default term and condition values that you assigned to the selected contract type in the Organizations application.

---

## Term types

A term type is a user-defined value that is associated with a term in the Terms and Conditions application. The term type allows you to filter all records in the Terms and Conditions library by searching on the Type field. Defining a term type is optional.

---

## Working with terms and conditions

You can define and delete terms and conditions that can be used in the purchasing and contracts applications. You can associate terms and conditions with purchase order and contract records to determine the rules that your company and your vendors must follow on purchase order and contract transactions.

- [Defining terms](#)  
You use the Terms and Conditions application to define terms that apply to purchase orders.
- [Creating and deleting terms](#)  
You can create terms and conditions for contracts and records. You can delete terms when they are no longer needed.
- [Associating existing terms with records](#)  
You can associate terms and conditions with records to define the rules that your company and your vendors must follow on purchase order and contract transactions.
- [Modifying terms](#)  
You use the Terms and Conditions application to modify the terms of a purchase order.

- [Modifying the sequence of terms for records](#)  
You can change the order in which the terms for a record display. You can modify the sequence to display a more logical order, or to list certain terms sequentially.
- [Setting default terms](#)  
You use the Terms and Condition application to specify that certain terms default on all purchase orders that are created.
- [Sorting terms by type](#)  
You use the Terms and Conditions application to sort terms by type.
- [Defining terms](#)  
You use the Terms and Conditions application to define terms that apply to purchase orders.
- [Creating and deleting terms](#)  
You can create terms and conditions for contracts and records. You can delete terms when they are no longer needed.
- [Associating existing terms with records](#)  
You can associate terms and conditions with records to define the rules that your company and your vendors must follow on purchase order and contract transactions.
- [Modifying terms](#)  
You use the Terms and Conditions application to modify the terms of a purchase order.
- [Modifying the sequence of terms for records](#)  
You can change the order in which the terms for a record display. You can modify the sequence to display a more logical order, or to list certain terms sequentially.
- [Setting default terms](#)  
You use the Terms and Condition application to specify that certain terms default on all purchase orders that are created.
- [Sorting terms by type](#)  
You use the Terms and Conditions application to sort terms by type.

---

## Defining terms

You use the Terms and Conditions application to define terms that apply to purchase orders.

### Procedure

---

1. In the Organization table window, select the organization for which you want to define a term.
2. Click New Row.
3. Specify a value in the Term field. The value must be unique.
4. Type a description
5. Optional: Specify a value in the Type field. The value you define can be used to filter the Terms and Conditions library. For example, you might have defined a type as `PURCHASE`, in which all the corresponding records contain information applicable to purchase orders. You could then search on `PURCHASE` and find only the relevant terms.
6. To be able to edit the term when it is associated with records in other applications, select the Editable check box. Otherwise, clear the check box.
7. To have the term appear as a default on all future purchase orders, select the Default on PO check box. Otherwise, clear the check box.
8. Click Save Terms and Conditions.

---

## Creating and deleting terms

You can create terms and conditions for contracts and records. You can delete terms when they are no longer needed.

- [Creating terms](#)  
You can create terms and conditions that can later be associated with a contract or purchasing record. Terms and conditions can contain information such as: liability concerns, shipping and handling details, and delivery time expectations.
- [Deleting terms](#)  
You use the Terms and Conditions application to delete terms.
- [Creating terms](#)  
You can create terms and conditions that can later be associated with a contract or purchasing record. Terms and conditions can contain information such as: liability concerns, shipping and handling details, and delivery time expectations.
- [Deleting terms](#)  
You use the Terms and Conditions application to delete terms.

---

## Creating terms

You can create terms and conditions that can later be associated with a contract or purchasing record. Terms and conditions can contain information such as: liability concerns, shipping and handling details, and delivery time expectations.

### Before you begin

---

Terms and conditions can only be added to purchasing or contracts records set at statuses in progress or waiting on approval.

### Procedure

---

1. In a purchasing or contract application, display the record for which you want to create a term.
2. On the Terms and Conditions tab, click New Row.
3. Specify the sequence and term.
4. Optional: Select the Send to Vendor check box.
5. Save the record.

---

## What to do next

You can set default term and condition values according to site and contract type in the Organizations application. When you create a contract record in a contracts application, the contract inherits the default term and condition values that you assigned to the selected contract type in the Organizations application.

---

## Deleting terms

You use the Terms and Conditions application to delete terms.

---

## Procedure

1. In the Terms and Conditions application, in the Organization table window, select the organization to which the term belongs.
2. Click the Mark Row for Delete icon. To undo the delete before saving, click the Mark Row for Delete icon once more.
3. Click Save Terms and Conditions.

---

## Associating existing terms with records

You can associate terms and conditions with records to define the rules that your company and your vendors must follow on purchase order and contract transactions.

---

## About this task

The Terms and Conditions application maintains a library of terms and conditions with which you and your vendors must comply. You can select terms from this library to apply to contract and purchasing records.

---

## Procedure

1. In a purchasing or contract application, display the record for which you want to select a term.
2. On the Terms and Conditions tab, click Select Terms.
3. Select the Select Record check box next to each term that you want to associate with the record.
4. Click OK.
5. Optional: Select the term in the Terms and Conditions table window and select the Send to Vendor check box.
6. Save the record.

---

## Modifying terms

You use the Terms and Conditions application to modify the terms of a purchase order.

---

## About this task

Modifying a term does not update records that reference the term. The modifications only affect future instances.

---

## Procedure

1. In the Terms and Conditions application, in the Organization table window, select the organization to which the term you want to edit belongs.
2. Click View Details.
3. In the Details table window, edit the term information
4. Click Save Terms and Conditions.

---

## Modifying the sequence of terms for records

You can change the order in which the terms for a record display. You can modify the sequence to display a more logical order, or to list certain terms sequentially.

---

## Procedure

1. In the appropriate Purchasing or Contract application, display the record with which you want to associate a term.
2. Click the Terms and Conditions tab.
3. In the Terms and Conditions table window, locate the rows for which you want to change the sequence.
4. In the Sequence column for the appropriate rows, specify a value. You can enter any integer up to 9999. The product defaults the sequence numbers to multiples of 10. You can rearrange the order without renumbering the entire sequence.
5. Click Save.

---

## Setting default terms

You use the Terms and Condition application to specify that certain terms default on all purchase orders that are created.

---

### About this task

Modifying a term does not update records that reference the term. The modifications only affect future instances.

---

### Procedure

1. In the Terms and Conditions application, in the Organization table window, select the organization to which the term you want to edit belongs.
2. Click View Details.
3. In the Details table window, select the Default on PO check box.
4. Click Save Terms and Conditions.

---

## Sorting terms by type

You use the Terms and Conditions application to sort terms by type.

---

### About this task

Only terms associated with one organization can be viewed at one time.

---

### Procedure

1. In the Terms and Conditions application, in the Organization table window, select the organization to which the term you want to sort by type belongs.
2. In the Terms and Conditions table window for that site, click the Type column title. The terms are sorted by type.

---

## Release module

You use the Activities and Tasks application to plan, review, and manage activities and tasks. When you create an activity, you initiate the work process and create a historical record of the work being performed.

- **Activities and Tasks**  
You use the Activities and Tasks application to plan, to review, and to manage activities and tasks. An activity initiates the work process and creates a historical record of the work being performed. Activities are created in the Incidents and Problems applications. A task is a specific unit of work on a work order.

---

## Activities and Tasks

You use the Activities and Tasks application to plan, to review, and to manage activities and tasks. An activity initiates the work process and creates a historical record of the work being performed. Activities are created in the Incidents and Problems applications. A task is a specific unit of work on a work order.

An activity is a type of work order. A task can be created as part of an activity or part of another work order.

You can use the Activities and Tasks application to perform the following functions:

- Change the status of activities and tasks
- Take ownership of activities or tasks
- Assign ownership of activities and tasks to individuals or to workgroups
- Modify activities and tasks to reflect changes
- View related preventive maintenance and scheduling information
- Categorize the activities and tasks using classifications and attributes to simplify their management and retrieval
- Specify, view, and modify job tasks and the labor, material, services, and tool requirements for work plans
- View, add, and delete work orders and tickets that are related to an activity or to a task
- View follow-up records for an activity or a task
- View and create a work log and communication entries about a record

- [Activities and tasks overview](#)

An activity specifies the tasks, and the labor, materials, services, and tools needed to complete the task. Activities are created to document the required work, which can then be delegated to the individuals responsible for completing the work.

- [Working with activities](#)

Activities are created in the Incidents and Problems applications. Tasks are created as part of activities and other work orders. You can manage and modify activities and tasks in the Activities and Tasks application. For example, you can change the ownership or status of an activity or task.

---

## Activities and tasks overview

An activity specifies the tasks, and the labor, materials, services, and tools needed to complete the task. Activities are created to document the required work, which can then be delegated to the individuals responsible for completing the work.

- [Record ownership](#)

The owner of a record is the person or person group that is in charge of the record from an administrative perspective.

- [Activity statuses](#)

The status of an activity indicates its position in the processing cycle. The status determines which actions can be performed on the activity. For example, if the activity is approved (APPR), then the tasks can start.

- [Measurement points](#)

When you inspect an asset or a location, you can record and view the meter readings that correspond to measurement points in the job plan of the associated work order. You can also insert measurement points on an activity until the activity or task is closed.

- [Service level agreements](#)

A service level agreement (SLA) typically is a written agreement that outlines the commitment between a service provider and its customers. A commitment is a service level that all parties have agreed to, such as asset reliability or availability.

- [Record relationships](#)

Relationships between records, such as tickets and work orders, help simplify record management. You can create record relationships manually, or relationships might be created automatically when you take certain actions.

- [Costs on tickets and work orders](#)

You can view the estimated and actual costs for a single work order or ticket, including costs for labor, material, tools, and services. You can also view total costs for the current record and all the records below it in its hierarchy.

- [Work plan removal](#)

Under certain circumstances, you can remove a work plan from an activity by using the Remove Work Plan action.

- [Deletion rules for activities](#)

For auditing purposes, you cannot always delete activities. If you cannot delete a specific activity, you can stop all action on an activity by changing the status to canceled.

- [Rules for modifying archived activities](#)

Closed and canceled activities are archived, and become historical records. You might be able to add additional information to a historical record by using the Edit History Activity action.

---

## Record ownership

The owner of a record is the person or person group that is in charge of the record from an administrative perspective.

The owner of a record keeps the customer updated and acts as the point person for any issues involving the work. You can use the Select Owner action to assign record ownership to a person or person group, or you can use the Take Ownership action if you want to take administrative ownership of the record yourself. You can take ownership for more than one application.

Keep in mind the following points regarding record ownership:

- A record can have many different owners during its life cycle.
- You can select an owner or owner group until the record's status is CLOSED.
- To view the ownership history of a record, select View History.
- A workflow or an escalation process may assign ownership, if appropriate.

If the Persons tab on your Select Owner dialog box displays a Person Group field and a Date field, then you can filter the list of persons by the values in these fields. For example, suppose the Person Group field and the Date fields are empty when you open the dialog box. You specify a person group and a date and time, and click Refresh. The system displays only the persons in the specified group who are available on the specified day and time.

---

## Activity statuses

The status of an activity indicates its position in the processing cycle. The status determines which actions can be performed on the activity. For example, if the activity is approved (APPR), then the tasks can start.

When you change the status of an activity, the status of any applicable child activity that uses the inherit status option also changes. If you change the status of global activities, the same status change is automatically applied to all globally related records. In addition, the status of an activity can be automatically changed. For example, after you assign an owner to an activity, the status of that activity automatically changes to queued.

A follow-up record can change the status of the originating activity, which results in automatic routing or notification of the status change.

WAPPR

The activity is waiting for approval. WAPPR is the default status for records created in the Work Order Tracking, Changes, Releases, and Activities and Tasks applications.

#### APPR

The activity is approved and the work can begin. Work plan items on an approved activity are reserved in inventory, and cost and rate data are recorded. Rates can be changed in the Inventory application, Labor application, or Tools application. If the rates are changed in any application, the work plan reflects the rates in effect when the activity was approved.

#### WSCH

The activity is waiting to be scheduled. WSCH is the default status for records created in the Preventive Maintenance application.

#### WMATL

Materials must arrive before the work can be performed.

#### WPCOND

The work can be performed only when the condition of the plant is suitable. For example, certain work might require the shutdown of the plant.

#### INPRG

The work is in progress. INPRG is the default status for records created in the Quick Reporting application.

#### COMP

The physical work is completed. If you want to move or change an asset on an activity, the move or change occurs when the status is changed to complete.

#### CLOSE

The activity is finalized. Inventory reservations for items not used in the activity are removed and the activity is made into a history record.

#### CAN

The work is canceled. You cannot cancel an activity if the work has already been initiated or if actuals have already been reported. You can use this status when you want to delete an activity and deleting is not allowed.

---

## Measurement points

When you inspect an asset or a location, you can record and view the meter readings that correspond to measurement points in the job plan of the associated work order. You can also insert measurement points on an activity until the activity or task is closed.

The product copies the measurement point number to the job plan when there is a three-way match between the following items:

- The measurement point name on the job plan listed on the activity.
- The measurement point name on the asset or the location listed on the activity.
- A measurement point number for the measurement point name.

If you specify a measurement for a measurement point, the measurement and measurement date are added to the Measurements table. If you specify a measurement without a measurement point, the measurement data is saved with the activity.

You use the Observation field to record visual inspection data. You use the Inspector field to record the name of the person performing the inspection. You can edit these fields until the activity is closed. Once the activity is closed, you can add or modify operations by selecting the Edit History Activity action.

---

## Service level agreements

A service level agreement (SLA) typically is a written agreement that outlines the commitment between a service provider and its customers. A commitment is a service level that all parties have agreed to, such as asset reliability or availability.

The SLA describes one or more commitments and the escalation actions or notifications associated with each commitment. Escalation actions or notifications might be associated with an SLA to ensure that commitments are met. An escalation process can monitor all activities and send notifications or perform other activities to ensure that commitments are met.

The types of records to which service level agreements can be applied include tickets, such as service requests, and work-based records, such as work orders. Before you can apply an SLA to a record, the record must have a site defined.

A service level agreement can be associated with a record in several ways:

- An SLA might automatically be applied to a record from within a workflow or escalation process, or from another SLA.
- You can select an action to apply an SLA, which applies the best match automatically.
- You can view SLAs and select an action to select or clear the SLAs that you want to manually apply to the record.

When you apply a service level agreement to a record, the following events occur:

- The SLA Applied check box on the main tab of the record is selected to document the action.
- Any escalations that are associated with the SLA are activated.
- The Target Start, Target Finish, and Contact values for the record might be calculated automatically as follows:

Automatically calculated values
When an SLA is applied that includes a response commitment, the response commitment date populates the Target Start date field of the record.
When an SLA is applied that includes a resolution commitment, the resolution commitment date populates the Target Finish date field of the record.
When an SLA is applied that includes a contact commitment, the contact commitment date populates the Target Contact date field of the record.

---

## Record relationships

Relationships between records, such as tickets and work orders, help simplify record management. You can create record relationships manually, or relationships might be created automatically when you take certain actions.

The types of relationships that can exist between records include:

- Related relationship, which is an informal association of tickets that is used for informational purposes.
- Originator and Follow-up, which keep costs hierarchies separate while still creating a relationship between the tickets.
- Related to Global, which creates a relationship in which the tickets are related to a global issue, which affects many users.

## Related records

Using any ticket or work-based application, you can view similar records and relate tickets and work orders to the current record. A related relationship between records is an informal relationship that is for informational purposes only.

A related relationship does not affect status inheritance, affect workflow, or follow a set of business rules. Related relationships can be many-to-many, and do not represent record hierarchies. By relating records informally, you can navigate to related records, view related information for similar records, and view open tickets that are associated with a field. You can create an informal record relationship in the following ways:

- Use the Related Records tab of the application. This tab provides an easy way to create relationships and to view and navigate among informally related records.
- Use the Show Similar Tickets action in any ticket application. The similar ticket search results only include the service requests, incidents, and problems that have the same classification as the current ticket. Global records and history records are not included in the results. Your system administrator might add more restrictions to the search results.

## Originator and follow-up tickets and work orders

You can relate tickets and work orders to a record more directly when you create a follow-up record from the ticket using one of the Create actions on the ticket. The ticket you create the follow-up record from is the originator. A follow-up record can be a ticket or a work order. In some cases, a follow-up ticket or work order might be able to change the status of its originating ticket. An originating ticket cannot change the status of a follow-up work order, nor can a follow-up ticket change the status of the originator if there is more than one follow-up. These options are configured by the system administrator.

## Globally related tickets

A global ticket is an incident or problem relating to an issue that affects many users. You can relate tickets, including service requests, to a global ticket, which creates a RELATEDTOGLOBAL relationship. This relationship lets you manage the tickets by using the global ticket. When you change the status of the global ticket, the system changes the status of all globally related tickets.

If your administrator has set up automated notifications of status changes, the system changes the status of the tickets related to the global issue. For example, all the initial requestors reporting the same issue are notified of its resolution. On the global ticket, you can also view a list of related records and view the work and communication logs for all related records.

- [Deletion of record relationships](#)  
On the Related Records tab, you can delete the relationship between a change and any related work orders or tickets.
- [Global records](#)  
A global record is a ticket that is a root cause of other issues or that affects many users, such as computer network failures or flooding in a building. After you mark a record as global, you can relate multiple tickets and then manage all tickets using the global record.

---

## Costs on tickets and work orders

You can view the estimated and actual costs for a single work order or ticket, including costs for labor, material, tools, and services. You can also view total costs for the current record and all the records below it in its hierarchy.

When you view the costs of a ticket or work order, the data is displayed in two tables:

- The Totals table displays the costs for a single ticket or work order.
- The View Hierarchy Grand Totals table displays the costs for the current ticket or work order and all records under its hierarchy.

Each table presents the same information, which is shown in the following table.

Column	Explanation
Current Estimate	Displays read-only calculated values for the current totals from the Labor, Materials, Standard Services, and Tools tabs of the Plans tab for the ticket or work order.
Estimate at Approval	Is set to zero until the work order is approved, then the values are copied from the Current Estimate column and are read-only. If the work order status changes from approved to unapproved, then these fields are cleared. The estimated costs at approval are not affected by the change in status from in progress to completed or closed.
Actual	Displays the read-only values from the Labor (for approved labor only), Materials, and Tools tabs of the Actuals tab. If the status of the record changes from approved, then these fields are not cleared.

## Rolling up maintenance costs

After you close a work order that is associated with an asset, you can calculate your maintenance costs by rolling up costs that you incur for labor, materials, tools, and services to the top-level asset in the hierarchy that the asset belongs to.

Costs can be rolled up manually or automatically. By default, cost rollups are manual. If you want costs to be calculated and rolled up automatically when a work order is closed, you must set the `mxe.workorder.rollupMaintenanceCosts` system property to 1. After you configure the system property for automatic rollups, all subsequent costs that are associated with work orders are rolled up automatically. However, any unprocessed maintenance costs that existed before the configuration are not automatically rolled up. You must roll up any preexisting, unprocessed maintenance costs manually.

To calculate the maintenance cost of your assets, use the Roll Up Maintenance Costs action in the Assets application.

If you upgrade to Maximo® Manage 8.5, run the Asset Cost Rollup Report to roll up pending maintenance costs before the upgrade.

---

## Work plan removal

Under certain circumstances, you can remove a work plan from an activity by using the Remove Work Plan action.

When you remove a work plan, all information in the Resources tab, except for non-task children, is removed. Also, if the work plan has a job plan, the job plan identifier is removed.

If any task in the work plan cannot be removed based on the deletion rules for changes, you cannot use the Remove Work Plan action. You can still delete labor, material, services, and tools information, as well as any tasks that do meet the deletion rules.

---

## Deletion rules for activities

For auditing purposes, you cannot always delete activities. If you cannot delete a specific activity, you can stop all action on an activity by changing the status to canceled.

The activity and its children must meet the following criteria to be deleted:

- Have a status of waiting for approval
- Not have any transactions registered against it, except for status changes
- Not have any actuals reported against it
- Not have any labor assignments associated with it
- Not have been generated for a purchase order or receipt
- It must not have any failures reported against it.
- Not be in a workflow or have ever been in a workflow
- Not have any measurements or meter readings taken against it
- Cannot be or have follow-up work

To delete an activity, use the Delete `Activity` action.

---

## Rules for modifying archived activities

Closed and canceled activities are archived, and become historical records. You might be able to add additional information to a historical record by using the Edit History Activity action.

When you modify an archived activity, the following rules apply:

- New costs that were incurred during the edit history must be added to the inventory cost, if it is defined as charge to store.
- You can add actual labor, but you cannot change approved transactions.
- You can add actual materials and actual tools, but you cannot change them.
- You can add or delete child records, whether or not the child records are tasks.
- You can attach documents.
- You cannot change planned labor, materials, and tools.
- You cannot change information in the following fields:
  - Asset.
  - Location.
  - GL Account.
  - Charge to Store.
  - Status.
  - Status Date

---

## Working with activities

Activities are created in the Incidents and Problems applications. Tasks are created as part of activities and other work orders. You can manage and modify activities and tasks in the Activities and Tasks application. For example, you can change the ownership or status of an activity or task.

- **[Planning activities and tasks](#)**

After you associate a task with an activity, you can specify estimates for labor, craft, materials, services, and tools for each task on the activity or for the

activity as a whole.

- [Reporting actuals for activities and tasks](#)  
As work progresses on an approved activity or task, you can report the actual labor hours, materials, services, and tools used.
- [Applying service level agreements to records](#)  
You can apply a service level agreement (SLA) to a record to define the agreement and formal commitments between a service provider and a customer. The agreement documents the service to be provided or received, the agreed upon service levels for the service, and the means of measuring or quantifying the level of service.
- [Swapping assets](#)  
You can swap assets associated with a work order. The swap action applies to the work order and all of the assets, locations, and configuration items on its child work orders. The term "work order" can refer to a work order, change, release, or activity record.
- [Relating work orders or tickets to activities or to tasks](#)  
You can link work orders and tickets to an activity or task. When you link a record to a work order, its relationship type is RELATED.
- [Classifying activity records](#)  
To simplify the process of finding and managing activity records, you can classify the records. Categorizing an activity involves classifying it and adding and modifying attributes to further group the classification.
- [Setting up work process flows](#)  
Work process flows use relationships between work orders and tasks to automate the flow of status changes. You set relationships between work orders and tasks so that when a task is completed, the next task in the flow can be initiated.
- [Changing the status of activities or tasks](#)  
You can change the status of an activity to indicate the position of the activity as it moves toward completion.

---

## Planning activities and tasks

After you associate a task with an activity, you can specify estimates for labor, craft, materials, services, and tools for each task on the activity or for the activity as a whole.

- [Creating work plans](#)  
A work plan describes the labor, materials, tools, services, and tasks you need to complete an activity or task. You can create a work plan manually.
- [Planning work for activities and tasks](#)  
You use the Activities and Tasks application to insert, view, or edit planned labor information or planned craft information.
- [Creating tasks for activities](#)  
You use the Activities and Task application to create additional tasks or to edit the existing tasks for an activity. After you create a task, you can plan its labor, materials, services, and tools.

---

## Creating work plans

A work plan describes the labor, materials, tools, services, and tasks you need to complete an activity or task. You can create a work plan manually.

---

### Procedure

1. In the Activities and Tasks application, display the record for which you want to create a plan.
2. Make one of the following selections:

Option	Description
<b>If the record is an activity</b>	Click the Plans tab.
<b>If the record is a task</b>	Click the Resources tab, then click the Plans sub tab.

3. Specify work plan data, such as tasks, labor, materials, tools, and services using the sub tabs.
4. Save the record.

- [Creating work plans using job plans](#)  
A work plan describes the labor, materials, tools, services, and tasks you need to complete an activity. You can select a job plan, and modify it to your needs.

---

## Creating work plans using job plans

A work plan describes the labor, materials, tools, services, and tasks you need to complete an activity. You can select a job plan, and modify it to your needs.

---

### Procedure

1. In the Activities and Tasks application, display the record for which you want to create a work plan from a job plan.
2. Make one of the following selections:

Option	Description
<b>If the record is an activity</b>	Click the Plans tab.
<b>If the record is a task</b>	Click the Resources tab, then click the Plans sub tab.

3. In the Job Plan field, click Detail Menu and select an option to retrieve a value. When you associate a job plan with a work order, the product copies the labor, the materials, the services, and the tools to the work order plan. If the job plan has a default safety plan for the selected work asset, the product also copies the safety plan to the work order.
4. Optional: Edit the fields to modify any of the information. Changes you make to the work plan do not affect the original job plan.

5. Save the record.

---

## Planning work for activities and tasks

You use the Activities and Tasks application to insert, view, or edit planned labor information or planned craft information.

### Procedure

---

1. Display the activity or task for which you want to plan labor.
2. Make one of the following selections:

Option	Description
<b>If the record is an activity</b>	Click the Plans tab.
<b>If the record is a task</b>	Click the Resources tab, then click the Plans sub tab.

3. Enter the details of the planned work on the following subtabs:

Option	Description
<b>Labor</b>	Add hours for labor or select crafts.
<b>Materials</b>	Add materials, search catalogs, or add spare parts.
<b>Services</b>	Add services.
<b>Tools</b>	Add tools.

4. Save the record.

---

## Creating tasks for activities

You use the Activities and Task application to create additional tasks or to edit the existing tasks for an activity. After you create a task, you can plan its labor, materials, services, and tools.

### Procedure

---

1. Display the activity for which you want to create planned tasks.
2. In the Tasks table window on the Plans tab, click New Row.
3. Specify a unique value in the Task field.
4. To have the tasks performed in a specific order, enter the appropriate value in the Sequence field.
5. Type the amount of time needed to complete the task in the Estimated Duration field.
6. Use the Labor, Materials, Services, and Tools subtabs to plan for the task.
7. Save the activity.

---

## Reporting actuals for activities and tasks

As work progresses on an approved activity or task, you can report the actual labor hours, materials, services, and tools used.

### Procedure

---

1. Display the activity or task for which you want to report actuals.
2. Make one of the following selections:

Option	Description
<b>If the record is an activity</b>	Click the Plans tab.
<b>If the record is a task</b>	Click the Resources tab, then click the Plans sub tab.

3. Enter the details for the actuals on the following subtabs:

Option	Description
<b>Labor</b>	Report hours for labor, copy labor from the work plan, or select planned labor.
<b>Materials</b>	Select materials, select reserved items, and select spare parts.
<b>Services</b>	Select services or standard services.
<b>Tools</b>	Select tools, copy tool data from the work plan, or select tools that were issued.

4. Save the record.

---

## Applying service level agreements to records

You can apply a service level agreement (SLA) to a record to define the agreement and formal commitments between a service provider and a customer. The agreement documents the service to be provided or received, the agreed upon service levels for the service, and the means of measuring or quantifying the level of service.

## About this task

---

When you apply an service level agreement to work orders, the SLA is applied only to the work order, not to its tasks. If you want to apply a service level agreement to a task, you must display the task as the current record and then apply the SLA.

You can apply service level agreements to tickets and work orders.

## Procedure

---

1. Open an application and display the record that you want to update.
2. Select the Apply SLA action.
3. Click OK.

## Results

---

The SLA Applied check box on the main tab of the selected application is selected. The target start, target finish, and contact values are calculated for the selected record.

---

## Removing service level agreements from records

To maintain accurate records, it might be necessary to remove an invalid or erroneous service level agreement to disassociate it from the record.

## Procedure

---

1. Display the record for which you want to remove a service level agreement.
2. Select the Select/Deselect SLA action.
3. Click Mark Row for Delete for each service level agreement that you want to remove from the record.
4. Click OK.
5. Save the record.

---

## Swapping assets

You can swap assets associated with a work order. The swap action applies to the work order and all of the assets, locations, and configuration items on its child work orders. The term "work order" can refer to a work order, change, release, or activity record.

## Before you begin

---

You can execute the swap immediately, or you can save the swap as a plan. If you save the swap as a plan, the changes will apply when the status for the work order is COMP (Complete). When the status of a work order is COMP, you swap assets only using the Execute Now option. When you select Execute Now on any tab, the system executes the changes on all tabs.

When you duplicate a work order that has a planned swap to its assets or locations, the planned action does not get copied to the duplicate work order. Also, when you create a release, or change, or work order from a record using the Select Action menu option, the planned action is not copied to the follow-up record.

## Procedure

---

1. Select the Move/Swap/Modify action.
2. Click the Move/Swap tab.
3. Select the Is this an Asset Swap checkbox.
4. In the Swap Assets section, select the row for the asset you want to swap.
5. To move the asset to a parent or location, type a value in the appropriate field, or click Select Value to retrieve a value.
6. In the Replacement Asset field, specify an asset, or click Select Value to retrieve a value.
7. Perform one of the following actions:
  - To swap the assets immediately, click Execute Now.
  - To swap the assets when the status for the work order is COMP (Complete), click Save as Plan.

---

## Relating work orders or tickets to activities or to tasks

You can link work orders and tickets to an activity or task. When you link a record to a work order, its relationship type is RELATED.

## Procedure

---

1. In the Activities and Tasks application, display the record to which you want to add related records.
2. On the Related Records tab, perform either of the following actions:
  - To relate a work order to the current record, in the Related Work Orders table window, click Add Row.

- To relate a ticket to the current record, in the Related Tickets table window, click Add Row.
3. Type or select a work order in the Work Order field, or specify a ticket in the Related Record Key field.
  4. Optional: You can enter a class.
  5. Save the activity.

- [Assigning a parent to a work order](#)

You can assign a parent to a work order and assign tasks to that parent. When you assign work order records to a parent, they become child work orders records of the parent record.

- [Removing relationships between records](#)

You can remove the relationship between an activity or a task and its related work orders or tickets.

---

## Assigning a parent to a work order

You can assign a parent to a work order and assign tasks to that parent. When you assign work order records to a parent, they become child work orders records of the parent record.

---

### About this task

You cannot assign parent records to closed work order records. If the parent has a value in the Priority field, and the child or children work order records do not, the child or children work order records inherit the parent priority value.

---

### Procedure

1. Open an application and display the work order record that you want to update.
2. On the List tab, select the task that you want to update.
3. Select the Assign To New Parent action.
4. Select the work order record that you want as the new parent.  
The asset management system displays the parent work order number in the Parent WO field.
5. Click Save record.

---

## Removing relationships between records

You can remove the relationship between an activity or a task and its related work orders or tickets.

---

### Before you begin

You can remove the relationship between records only if the ticket or the work order has a type of RELATED.

---

### About this task

To delete relationships with work orders of other relationship types, such as FOLLOWUP or ORIGINATOR, delete the work order in any of the following applications:

- Work Order Tracking
- Activities and Tasks
- Changes
- Releases

To delete relationships with tickets of other relationship types, you must go to the tickets applications.

---

### Procedure

1. In the Activities and Tasks application, display the record with the related relationship that you want to delete.
2. On the Related Records tab, select the record in the Related Work Orders table window.
3. Click the Mark Row for Delete icon. You can mark more than one row.
4. Click Save Activity.

---

## Classifying activity records

To simplify the process of finding and managing activity records, you can classify the records. Categorizing an activity involves classifying it and adding and modifying attributes to further group the classification.

---

### About this task

For example, you might classify an activity as a notebook. The notebook classification might have the attributes of memory, speed, and disk space associated with it, which are copied to the record upon classification. As needed, you can add attributes such as operating system and power, change the attribute values, and

remove attributes associated with the record.

## Procedure

1. In the Activities and Tasks application, display the activity record that you want to categorize.
2. Select a classification for the activity in one of the following ways:

Choice	Description
<b>Use the Classification field</b>	In the Classification field of the main application tab or on the Activities and Tasks tab, click Detail Menu and then select Classify to produce a classification hierarchy tree that you can drill down through and select a classification.
<b>Use the Class Description field</b>	In the Class Description field of the main application tab or on the Activities and Tasks tab, you can hasten the classification search as follows: <ol style="list-style-type: none"><li>a. Click the Select Value icon next to the Class Description field and enter a keyword or a word string, such as <i>Operating System</i> into the Description field of the window. All classification values that contain the keyword or word string are retrieved.</li><li>b. Click a value from the resulting list to select the classification.</li></ol>

3. Optional: You can view the attributes that are associated with the selected classification in the Attributes table window. You can also add, delete, and change the values of the attributes in the row details.
4. Save the activity.  
The full classification path appears in the Classification field, where you can view all nodes of the classification.

## Setting up work process flows

Work process flows use relationships between work orders and tasks to automate the flow of status changes. You set relationships between work orders and tasks so that when a task is completed, the next task in the flow can be initiated.

## Before you begin

To set the process flow for individual tasks, you must select Under Flow Control at the header level for the work order.

## About this task

The best practice for consistently using the flow feature is to set up the process flow as a work template at the job plan level.

## Procedure

1. Open the work order.
2. Select Under Flow Control.
3. On the Plans tab, display the details for the task.
4. In the Scheduling Information section, next to the Predecessors field, click the Detail Menu icon.
5. Select the tasks that must be completed before this task is initiated.
6. Save the work order.

- **Defining flow actions**

A flow action is used in a work process flow to define certain actions that should occur while work is being done. Actions or action groups can be applied to any work order, task, or job plan task.

- **Removing work process flow from work orders or job plans**

You can remove work process flow for a work order, a job plan, or task records that have it defined. You can do this at the header level, which will remove it for all the associated tasks as well, or you can remove it at the task level.

- **Suspending work process flows**

You can suspend the work process flow for work order or task records that have it defined. For example, if you want to start a work order or task manually, you could suspend the flow control on that record. The flow remains suspended until you remove the suspension.

- **Stopping workflow processes**

You can stop a workflow process for a record. You use the Workflow Administration application to view and stop workflow processes.

## Defining flow actions

A flow action is used in a work process flow to define certain actions that should occur while work is being done. Actions or action groups can be applied to any work order, task, or job plan task.

## About this task

You can determine whether the action takes place automatically, or if the action only takes place when it is initiated manually. When automatic, the action takes place as soon as the work order or task status is changed to an in progress (INPRG) status value by work process flow. When manual, you must initiate the flow action by running the automation or processing scripts or placing an action button on the target application. Actions and action groups are defined in the Actions application.

## Procedure

1. In an application that supports flow action, display the record for which you want to define a flow action.
2. Perform one of the following actions:
  - For a work order, change, release, or job plan record, enter a value in the Flow Action field on the application tab.
  - For a work order or job plan task, enter a value in the Flow Action field in the Task table window. The Tasks table window is found on the main tab of the Job Plans application, or the Plans tab of the Work Order Tracking, Changes, and Releases applications.The defined action runs when the work order or task status value is changed to INPRG.
3. Specify whether you want the flow action to be automatically run:

Option	Flow Action Assist
Automatically run the flow action	Cleared
Manually run the flow action	Selected
4. Click Save record.

---

## Removing work process flow from work orders or job plans

You can remove work process flow for a work order, a job plan, or task records that have it defined. You can do this at the header level, which will remove it for all the associated tasks as well, or you can remove it at the task level.

### About this task

If work process flow is removed at the header level, it will automatically be removed on individual tasks on the record. You cannot retain work process flow for a task that does not have it set at the header level.

### Procedure

1. In an application that supports flow action, display the record that you want to remove from work process flow.
2. On the main application tab, clear the Flow Controlled check box. The system removes the work order or the job plan, and all of its tasks from work process flow.
3. Click Save Record.

---

## Suspending work process flows

You can suspend the work process flow for work order or task records that have it defined. For example, if you want to start a work order or task manually, you could suspend the flow control on that record. The flow remains suspended until you remove the suspension.

### Before you begin

Removing the suspension restarts the flow. Any successor work orders or tasks with completed predecessors continue the process. Work orders and tasks without predecessors continue the process at the same time as the parent record. The last completed child under a parent rolls its completion up to the parent.

### Procedure

1. In an application that supports flow action, display the record on which you want to suspend flow control.
2. On the main application tab, at the header level, select the Suspend Flow Control check box. The system suspends the work process flow on the work order and on all of its tasks.
3. To retain flow control for individual tasks, display the tasks in the Tasks table window, and clear the Suspend Flow Control check box at the task level. Flow control remains in place at the task level. This action does not affect the suspension at the work order header level. You can find the Tasks table window on the Plans tab.
4. Click Save Record.

### Example

You generally suspend a set of tasks, often under the same parent. For example, you can delay the automatic starting of one whole phase of work until a certain condition has been met. You can also delay starting a phase of work to make changes to the tasks, such as inserting tasks, deleting tasks, and changing the precedence logic.

---

## Changing the status of activities or tasks

You can change the status of an activity to indicate the position of the activity as it moves toward completion.

### Procedure

1. In the Service Requests, in the Problems, or in Incidents application that corresponds to the type of record you are managing, display the record whose status you want to change.
2. Select the Change Status action.

3. In the New Status field, choose a status from the pull-down menu.
4. Click OK to change the status.

## What to do next

---

If you change a ticket to a RESOLVED status, and you are the designated owner of that ticket, you might want to stop the timer or otherwise report the time that you spent resolving the issue.

## Security module

---

You use the applications in the Security module to implement and manage security for users and groups.

- [Security Groups](#)  
You use the Security Groups application to set up and to manage security privileges for users.
- [Users](#)  
In the Users application, you can manage certain information in user records. New user records are created in Maximo Application Suite and can be synchronized to Maximo Manage. User records contain user names and security profiles that determine the applications, options, and data that a user can access.

## Security Groups

---

You use the Security Groups application to set up and to manage security privileges for users.

You can assign users to groups from both the Security Groups application and from the Users application:

- In the Security Groups application, you assign users to groups.
- In the Users application, you assign groups to users.

You can view the security privileges for a user using the Security Profile tab in the Users application.

Upon implementation, the Security Groups application has the following groups:

- MAXDEFLTREG - This group allows users to change their password if it expires. The group contains no other rights. When you create a user record, the user is placed in this default group. You can specify a different group to be the default using the Security Controls action. If you want new user security profiles to start with more rights, you can change the MAXDEFLTREG group to include these rights.
- MAXADMIN - This group provides enough access to add users and groups.
- MAXREG - This group allows users to self register. You can use the MAXREG group to initiate a workflow process by which an administrator is alerted to assign new users to the appropriate security groups.
- MAXEVERYONE - This group is used for global settings that apply to all users in the system.

When you delete users and security groups on the Lightweight Directory Access Protocol (LDAP), the users and security groups are not deleted in the system. This restriction is for audit purposes for clients in regulated industries.

## Multisite implementation

---

If your company has multiple sites, you can create groups to reflect these sites. You can then combine the site groups with functional groups to create fine-grained sets of security privileges. For example, if you have sites in Toronto and Montreal, you can name two groups TORONTO and MONTREAL. You can then add groups to reflect functional units, such as finance, administration, maintenance, electrical, and so on.

## Application server

---

If implementation uses an application server to authenticate with an external directory, some functions are performed in the directory and synchronized into the system. These functions include adding users (including self-registration), adding security groups, associating users with security groups, and managing passwords. In addition, when you delete users in the directory, those users are not automatically deleted in the system; you must manually delete them.

## Users

---

In the Users application, you can manage certain information in user records. New user records are created in Maximo® Application Suite and can be synchronized to Maximo Manage. User records contain user names and security profiles that determine the applications, options, and data that a user can access.

User records must have associated person records. A user record can be associated with only one person record and a person record can be associated with only one user record. You can associate a labor record and a user record with the same person record.

The following table describes the database tables that are updated when a user is synchronized to Maximo Manage.

Table 1. Database tables that are updated for user records

Database table	Description
MAXUSER	<ul style="list-style-type: none"><li>• Updates with new user data.</li></ul>

Database table	Description
PERSON	<ul style="list-style-type: none"> <li>Updates with new person data (if a person record needs to be created for the new user).</li> </ul>
PHONE	<ul style="list-style-type: none"> <li>Stores all user phone number information, including home phone number, work phone number, cell phone number, pager number, and so on.</li> <li>Indicates primary phone number.</li> </ul>
EMAIL	<ul style="list-style-type: none"> <li>Stores all user email addresses, including home email address, work email address, and alternate email addresses</li> <li>Indicates primary email address</li> </ul>
GROUPUSER	<ul style="list-style-type: none"> <li>Updates the relationship between security groups and the user.</li> </ul>
USERPURGL	<ul style="list-style-type: none"> <li>Stores the default purchasing general ledger account for the new user.</li> <li>This data is optional.</li> </ul>
GRPREASSIGNAUTH	<ul style="list-style-type: none"> <li>Stores the name of the user as a person with authority to add users to a security group</li> <li>This data is optional.</li> </ul>
MAXUSERSTATUS	<ul style="list-style-type: none"> <li>Shows the status for the user.</li> <li>Stores the history of user status changes.</li> </ul>

## Self Service module

Self-Service users (with proper permissions) can register themselves in the system and use the applications in the Self-Service modules (Desktop Requisitions and Service Requests) to create records without the assistance of an administrator or a service desk agent.

See each module for a description of its applications.

- [Desktop Requisitions](#)  
As a self-service user, you use the applications in the Desktop Requisitions module (within the Self Service module) to create and to view purchase requisitions. You also can use the applications to create template requisitions for repeat orders and create lists of items that you order frequently. You can also check the status of your orders.
- [Service Requests](#)  
As a self-service user, you use the applications in the Service Requests module (within the Self Service module) to create and view a service request for equipment repair or configuration, and to request and search for information. You can choose a template to best suit your specific request type.

## Desktop Requisitions

As a self-service user, you use the applications in the Desktop Requisitions module (within the Self Service module) to create and to view purchase requisitions. You also can use the applications to create template requisitions for repeat orders and create lists of items that you order frequently. You can also check the status of your orders.

- [Create Requisition](#)  
In the Create Requisition application, you create a desktop requisition to search for and order items and services from either an internal source, such as a company storeroom, or an external vendor.
- [View Requisition](#)  
You use the View Requisition application to search for, view, and change the status of your existing desktop requisitions.
- [View Drafts](#)  
You use the View Drafts application to manage your draft desktop requisitions.
- [View Templates](#)  
You use the View Templates application to view requisition templates. A requisition template is a requisition that you can reuse. These templates contain information about shipping, charge accounts, and line items.

## Create Requisition

In the Create Requisition application, you create a desktop requisition to search for and order items and services from either an internal source, such as a company storeroom, or an external vendor.

In addition, you can create templates for requisitions for repeat orders, create a list of favorite items that you order frequently, and check the status of your order.

To create a desktop requisition, you must complete three steps:

1. Create a requisition
2. Add requisition lines
3. Review and submit a requisition

- [Desktop requisitions overview](#)  
You can set email notifications for desktop requisitions, and delete requisition lines.
- [Working with desktop requisitions](#)  
You can create desktop requisitions, add lines to requisitions, set default information, and distribute purchasing line item costs.

---

## Desktop requisitions overview

You can set email notifications for desktop requisitions, and delete requisition lines.

- [Deletion rules for requisition lines](#)  
As your business needs change, you can delete requisition lines from a desktop requisition.

---

## Deletion rules for requisition lines

As your business needs change, you can delete requisition lines from a desktop requisition.

You can delete a requisition line if a requisition meets one of these conditions:

- You have not submitted the requisition.
- The requisition is a draft.
- The requisition is not an approved purchase order.

---

## Working with desktop requisitions

You can create desktop requisitions, add lines to requisitions, set default information, and distribute purchasing line item costs.

- [Creating desktop requisitions](#)  
You create a desktop requisition to search for and order items and services from either an internal source, such as a company storeroom, or an external vendor.
- [Adding requisition lines for desktop requisitions](#)  
You create a desktop requisition to search for and order items and services from either an internal source, such as a company storeroom, or an external vendor. In this step, you specify line item information for the items and services that you need.
- [Setting default information on requisitions](#)  
When you create a requisition, default information is filled in as you proceed through the steps. The default information is from your profile, which may have been created for you, or which you created as a result of registering. You can review and modify the information in your profile.
- [Distributing purchasing line item costs](#)  
You can distribute the costs of a purchase order or desktop requisition line item across multiple GL accounts. For example, if your department ordered and received a new laser printer that the packaging department is also to use, you can specify two GL accounts for the printer, one for each department.

---

## Creating desktop requisitions

You create a desktop requisition to search for and order items and services from either an internal source, such as a company storeroom, or an external vendor.

---

### About this task

This is the first step to create a desktop requisition.

---

### Procedure

1. Open the Create Requisition application to create a desktop requisition.
2. Optional: Complete the following steps to provide additional information:
  - a. Change the automatically generated requisition number.
  - b. Provide a description of the requisition.
  - c. Specify a template for a repeat order.
  - d. Specify values for the date the items or services are needed, for who is requesting the items or services, and for whom the items and services are being requested.
  - e. Change the priority value.
3. Specify the shipping information for the items.
4. Optional: If the items or services are being charged to a general ledger account, a work order, a location, or an asset, specify the values for this information.
5. Optional: If you are using a credit card to make the purchase, provide the number of the credit card, the card type, and the expiration date.
6. Click Continue to add requisition lines.

---

## Adding requisition lines for desktop requisitions

You create a desktop requisition to search for and order items and services from either an internal source, such as a company storeroom, or an external vendor. In this step, you specify line item information for the items and services that you need.

## Before you begin

---

Before you complete this step, you must complete the first step, creating desktop requisitions.

## Procedure

---

1. In the Create Requisition application, access the requisition to which you want to add line items.
2. To specify a line item, click New Row or select materials, favorite items, spare parts, existing requisitions, or a supplier's catalog.
3. Specify a line type and the additional information required for that line type.
4. Optional: Distribute the cost of the line item across more than one general ledger account.
5. Optional: Add the line item to your list of favorite items.
6. Click Continue to submit the requisition.

---

## Setting default information on requisitions

When you create a requisition, default information is filled in as you proceed through the steps. The default information is from your profile, which may have been created for you, or which you created as a result of registering. You can review and modify the information in your profile.

## Before you begin

---

Default information can consist of such data as shipping information, the default storeroom, and credit card (PCard) details. Shipping information may appear by default on requisitions even if it does not appear in the profile. Unless otherwise specified, default shipping information for your site is used.

## Procedure

---

1. From any screen in the system, click Profile from the menu bar.
2. From the Profile menu, select one of the following:
  - Default Information: to change your default insert site or storeroom
  - Personal Information: to change your Ship To address or procurement card information
3. Edit or add information in the window.
4. Click OK.

---

## Distributing purchasing line item costs

You can distribute the costs of a purchase order or desktop requisition line item across multiple GL accounts. For example, if your department ordered and received a new laser printer that the packaging department is also to use, you can specify two GL accounts for the printer, one for each department.

## Before you begin

---

If you want to distribute line item costs, the purchasing and desktop requisition records must meet the following conditions:

- The line item is a direct issue item or service
- None of the items have been received
- The service line is not prorated

## Procedure

---

1. In a purchasing or the Desktop Requisitions application, display the direct issue record that you want to update.
2. In the line item table window, click New Row.
3. Enter values in the following fields:
  - Item
  - Line Cost
4. Enter a value in one of the following fields:
  - Work Order
  - WO Task ID
  - Location
  - Asset
  - GL Debit Account
5. Click Distribute Costs.
6. Click New Row.
7. Enter values in the following fields:
  - Percentage
  - Line Cost
  - GL Debit Account

If you enter a percentage, the line cost representing that percentage is displayed. If you enter a portion of the line cost, the percentage for that cost is displayed. The first row in the Distribute Costs table displays the percentage and the total line cost of the line item that you entered. You must edit this row to be able to distribute costs for the line item.

8. Continue to enter rows until one of the following conditions is met:

- The sum of the percentage fields is equal to a value of 100%
  - The sum of the loaded cost fields are equal the total unit cost of the current line item
9. Click OK.
  10. Click Save record.

---

## View Requisition

You use the View Requisition application to search for, view, and change the status of your existing desktop requisitions.

In the View Requisition application, you can perform the following functions:

- View requisition details, history, and workflow information.
- Create a template of the requisition that you can use to create requisitions.
- Cancel a desktop requisition that you submitted, provided the requisition is not an approved purchase order.

The default restriction for View Requisition application is based on the user hierarchy. You can view requisitions that you created and requisitions that are assigned to you. You can also view requisitions that are assigned to, or created by, users below you in the hierarchy. For example, as a supervisor, you can view the requisitions assigned to, or created by, your employees.

- [Status of desktop requisitions](#)  
To manage desktop requisitions, you can change their status to canceled, draft, waiting on approval, and approved.
- [Viewing details of purchases associated with desktop requisitions](#)  
To manage your desktop requisitions, you can view the details of associated purchase orders, purchase requisitions, or request for quotations.

---

## Status of desktop requisitions

To manage desktop requisitions, you can change their status to canceled, draft, waiting on approval, and approved.

If you are changing the status to approved, you must have a monetary approval limit equal to or greater than the total cost of the requisition. Your system administrator sets approval limits for each user.

When you change the status of a requisition from approved to waiting for approval, the requisition becomes a draft requisition. You can view the requisition in the View Drafts application.

---

## Viewing details of purchases associated with desktop requisitions

To manage your desktop requisitions, you can view the details of associated purchase orders, purchase requisitions, or request for quotations.

---

## Procedure

1. In the View Requisitions application, search for and select the requisition for which you want to view purchasing details.
2. Click the History tab.
3. In the appropriate table window, select the relevant application to view the purchasing details.  
For example, in the PR field in the Purchase Requisitions Status History table window, go to the Purchase Requisitions application to view purchasing details for the record that selected.
4. Return to the View Requisition application.

---

## View Drafts

You use the View Drafts application to manage your draft desktop requisitions.

You can perform the following functions in the View Drafts application:

- Change a draft requisition.
- Create a template requisition that you can reuse.

The default restriction for the View Drafts application is based on the user hierarchy. You can view draft requisitions that you created and draft requisitions that are assigned to you. You can also view draft requisitions that are assigned to, or created by, users below you in the hierarchy. For example, a supervisor can view the draft requisitions assigned to, or created by, their employees.

- [Completing draft desktop requisitions](#)  
To manage your desktop requisitions, you can complete draft requisitions.

---

## Completing draft desktop requisitions

To manage your desktop requisitions, you can complete draft requisitions.

---

## Procedure

---

1. Select the draft desktop requisition that you want to complete.
2. Click Create/Edit Requisition.  
The draft requisition is displayed in the Create Requisition application.
3. Make necessary changes.
4. Click Submit.

---

## View Templates

You use the View Templates application to view requisition templates. A requisition template is a requisition that you can reuse. These templates contain information about shipping, charge accounts, and line items.

In the View Templates application, you can also change the template requisitions and create requisitions from the templates. You create requisition templates in the View Requisitions application and View Drafts application.

The default restriction for View Templates application is based on the user hierarchy. You can view templates that you created and templates that are assigned to you. You can also view templates that are assigned to, or created by, users below you in the hierarchy. For example, as a supervisor, you can view the templates assigned to, or created by, your employees.

- [Creating desktop requisitions from templates](#)  
To save time, you can use a requisition template to create a requisition.

---

## Creating desktop requisitions from templates

To save time, you can use a requisition template to create a requisition.

---

## Procedure

---

1. Select the requisition template.
2. Click Copy to New Requisition.  
The new requisition is displayed in the Create Requisition application.
3. Optional: Make any necessary changes.
4. Click Submit.

---

## Service Requests

As a self-service user, you use the applications in the Service Requests module (within the Self Service module) to create and view a service request for equipment repair or configuration, and to request and search for information. You can choose a template to best suit your specific request type.

You can view existing requests and drafts. The resulting requests (tickets) can be viewed and processed by a service desk agent using the Service Request application in the Service Desk module.

- [Create Service Request](#)  
You use the Create Service Request application to request a repair or change to your service. You can create the request for yourself or on behalf of another person.
- [View Service Requests](#)  
You use the View Service Requests application to view and print details about the service requests you created. You can also add or view attachments, such as documents or Web pages, and view solutions applied to the service requests. In addition, you can view and update the Service Request log, which contains communications to and from the service desk agent who is handling the service requests.

---

## Create Service Request

You use the Create Service Request application to request a repair or change to your service. You can create the request for yourself or on behalf of another person.

When you submit a service request it is sent to a service desk agent. The agent takes the appropriate action and can communicate with you about ongoing activities or a resolution. The Create Service Request application works in combination with the View Service Request application.

- [Creating a service request](#)  
You create a service request when you cannot find a solution to an issue.

---

## Creating a service request

You create a service request when you cannot find a solution to an issue.

### Procedure

---

1. Open the Create Service Request application.
2. Optional: If you are reporting on behalf of another person, edit the Affected User field.
3. Complete as many fields as possible.
4. Classify your service request using the Detail menu on the Classifications field.  
Classifying a service request makes it easier for the service desk agent to resolve your problem.
5. Optional: Attach documents such as images, text documents, or web pages that could be useful to the service desk agent.
6. Submit the service request.
7. To view the status of your service request, open the View Service Requests application.

---

## View Service Requests

You use the View Service Requests application to view and print details about the service requests you created. You can also add or view attachments, such as documents or Web pages, and view solutions applied to the service requests. In addition, you can view and update the Service Request log, which contains communications to and from the service desk agent who is handling the service requests.

- [Viewing service request details](#)  
To monitor the progress of your service requests and add information to them, you can view and update the requests using the View Service Requests application. The details you can view and modify include attachments, Web pages, solutions, and information in the Service Request communication log.

---

## Viewing service request details

To monitor the progress of your service requests and add information to them, you can view and update the requests using the View Service Requests application. The details you can view and modify include attachments, Web pages, solutions, and information in the Service Request communication log.

### Procedure

---

1. Display the record for which you want to display details.
2. In the View Service Requests table window, open the service request.
3. To add attachments, in the Attachments table window, either click Attach File or Attach Web Page. To view attachments, click the underlined record ID.
4. To add information to the Service Request log, click Update Service Request and enter information in the Summary and Details fields.

---

## Service Desk module

You use the applications in the Service Desk module to manage customer requests for help, information, and services.

Specifically, you can create and manage service requests (a type of ticket), manage activities (a class of work order) and tasks to describe general work that needs to be done on a ticket record. You can also create a ticket template (standard model) to hasten ticket data-entry time.

- [Activities and Tasks](#)  
You use the Activities and Tasks application to plan, to review, and to manage activities and tasks. An activity initiates the work process and creates a historical record of the work being performed. Activities are created in the Incidents and Problems applications. A task is a specific unit of work on a work order.
- [Service Requests](#)  
You use the Service Requests application to manage requests for services that involve an asset or location in your enterprise. For example, you might receive a request to upgrade the computer software on the notebook for a user, or for all users at certain locations.
- [Ticket Templates](#)  
Applying standardized templates to common and high-volume tickets saves time by letting the system populate values from the template into fields on the ticket. You create and manage templates using the Ticket Templates application.

---

## Activities and Tasks

You use the Activities and Tasks application to plan, to review, and to manage activities and tasks. An activity initiates the work process and creates a historical record of the work being performed. Activities are created in the Incidents and Problems applications. A task is a specific unit of work on a work order.

An activity is a type of work order. A task can be created as part of an activity or part of another work order.

You can use the Activities and Tasks application to perform the following functions:

- Change the status of activities and tasks
- Take ownership of activities or tasks
- Assign ownership of activities and tasks to individuals or to workgroups
- Modify activities and tasks to reflect changes
- View related preventive maintenance and scheduling information
- Categorize the activities and tasks using classifications and attributes to simplify their management and retrieval
- Specify, view, and modify job tasks and the labor, material, services, and tool requirements for work plans
- View, add, and delete work orders and tickets that are related to an activity or to a task
- View follow-up records for an activity or a task
- View and create a work log and communication entries about a record
- **[Activities and tasks overview](#)**  
An activity specifies the tasks, and the labor, materials, services, and tools needed to complete the task. Activities are created to document the required work, which can then be delegated to the individuals responsible for completing the work.
- **[Working with activities](#)**  
Activities are created in the Incidents and Problems applications. Tasks are created as part of activities and other work orders. You can manage and modify activities and tasks in the Activities and Tasks application. For example, you can change the ownership or status of an activity or task.

---

## Activities and tasks overview

An activity specifies the tasks, and the labor, materials, services, and tools needed to complete the task. Activities are created to document the required work, which can then be delegated to the individuals responsible for completing the work.

- **[Record ownership](#)**  
The owner of a record is the person or person group that is in charge of the record from an administrative perspective.
- **[Activity statuses](#)**  
The status of an activity indicates its position in the processing cycle. The status determines which actions can be performed on the activity. For example, if the activity is approved (APPR), then the tasks can start.
- **[Measurement points](#)**  
When you inspect an asset or a location, you can record and view the meter readings that correspond to measurement points in the job plan of the associated work order. You can also insert measurement points on an activity until the activity or task is closed.
- **[Service level agreements](#)**  
A service level agreement (SLA) typically is a written agreement that outlines the commitment between a service provider and its customers. A commitment is a service level that all parties have agreed to, such as asset reliability or availability.
- **[Record relationships](#)**  
Relationships between records, such as tickets and work orders, help simplify record management. You can create record relationships manually, or relationships might be created automatically when you take certain actions.
- **[Costs on tickets and work orders](#)**  
You can view the estimated and actual costs for a single work order or ticket, including costs for labor, material, tools, and services. You can also view total costs for the current record and all the records below it in its hierarchy.
- **[Work plan removal](#)**  
Under certain circumstances, you can remove a work plan from an activity by using the Remove Work Plan action.
- **[Deletion rules for activities](#)**  
For auditing purposes, you cannot always delete activities. If you cannot delete a specific activity, you can stop all action on an activity by changing the status to canceled.
- **[Rules for modifying archived activities](#)**  
Closed and canceled activities are archived, and become historical records. You might be able to add additional information to a historical record by using the Edit History Activity action.

---

## Record ownership

The owner of a record is the person or person group that is in charge of the record from an administrative perspective.

The owner of a record keeps the customer updated and acts as the point person for any issues involving the work. You can use the Select Owner action to assign record ownership to a person or person group, or you can use the Take Ownership action if you want to take administrative ownership of the record yourself. You can take ownership for more than one application.

Keep in mind the following points regarding record ownership:

- A record can have many different owners during its life cycle.
- You can select an owner or owner group until the record's status is CLOSED.
- To view the ownership history of a record, select View History.
- A workflow or an escalation process may assign ownership, if appropriate.

If the Persons tab on your Select Owner dialog box displays a Person Group field and a Date field, then you can filter the list of persons by the values in these fields. For example, suppose the Person Group field and the Date fields are empty when you open the dialog box. You specify a person group and a date and time, and click Refresh. The system displays only the persons in the specified group who are available on the specified day and time.

---

## Activity statuses

The status of an activity indicates its position in the processing cycle. The status determines which actions can be performed on the activity. For example, if the activity is approved (APPR), then the tasks can start.

When you change the status of an activity, the status of any applicable child activity that uses the inherit status option also changes. If you change the status of global activities, the same status change is automatically applied to all globally related records. In addition, the status of an activity can be automatically changed. For example, after you assign an owner to an activity, the status of that activity automatically changes to queued.

A follow-up record can change the status of the originating activity, which results in automatic routing or notification of the status change.

#### WAPPR

The activity is waiting for approval. WAPPR is the default status for records created in the Work Order Tracking, Changes, Releases, and Activities and Tasks applications.

#### APPR

The activity is approved and the work can begin. Work plan items on an approved activity are reserved in inventory, and cost and rate data are recorded. Rates can be changed in the Inventory application, Labor application, or Tools application. If the rates are changed in any application, the work plan reflects the rates in effect when the activity was approved.

#### WSCH

The activity is waiting to be scheduled. WSCH is the default status for records created in the Preventive Maintenance application.

#### WMATL

Materials must arrive before the work can be performed.

#### WPCOND

The work can be performed only when the condition of the plant is suitable. For example, certain work might require the shutdown of the plant.

#### INPRG

The work is in progress. INPRG is the default status for records created in the Quick Reporting application.

#### COMP

The physical work is completed. If you want to move or change an asset on an activity, the move or change occurs when the status is changed to complete.

#### CLOSE

The activity is finalized. Inventory reservations for items not used in the activity are removed and the activity is made into a history record.

#### CAN

The work is canceled. You cannot cancel an activity if the work has already been initiated or if actuals have already been reported. You can use this status when you want to delete an activity and deleting is not allowed.

---

## Measurement points

When you inspect an asset or a location, you can record and view the meter readings that correspond to measurement points in the job plan of the associated work order. You can also insert measurement points on an activity until the activity or task is closed.

The product copies the measurement point number to the job plan when there is a three-way match between the following items:

- The measurement point name on the job plan listed on the activity.
- The measurement point name on the asset or the location listed on the activity.
- A measurement point number for the measurement point name.

If you specify a measurement for a measurement point, the measurement and measurement date are added to the Measurements table. If you specify a measurement without a measurement point, the measurement data is saved with the activity.

You use the Observation field to record visual inspection data. You use the Inspector field to record the name of the person performing the inspection. You can edit these fields until the activity is closed. Once the activity is closed, you can add or modify operations by selecting the Edit History Activity action.

---

## Service level agreements

A service level agreement (SLA) typically is a written agreement that outlines the commitment between a service provider and its customers. A commitment is a service level that all parties have agreed to, such as asset reliability or availability.

The SLA describes one or more commitments and the escalation actions or notifications associated with each commitment. Escalation actions or notifications might be associated with an SLA to ensure that commitments are met. An escalation process can monitor all activities and send notifications or perform other activities to ensure that commitments are met.

The types of records to which service level agreements can be applied include tickets, such as service requests, and work-based records, such as work orders. Before you can apply an SLA to a record, the record must have a site defined.

A service level agreement can be associated with a record in several ways:

- An SLA might automatically be applied to a record from within a workflow or escalation process, or from another SLA.
- You can select an action to apply an SLA, which applies the best match automatically.
- You can view SLAs and select an action to select or clear the SLAs that you want to manually apply to the record.

When you apply a service level agreement to a record, the following events occur:

- The SLA Applied check box on the main tab of the record is selected to document the action.

- Any escalations that are associated with the SLA are activated.
- The Target Start, Target Finish, and Contact values for the record might be calculated automatically as follows:

Automatically calculated values
When an SLA is applied that includes a response commitment, the response commitment date populates the Target Start date field of the record.
When an SLA is applied that includes a resolution commitment, the resolution commitment date populates the Target Finish date field of the record.
When an SLA is applied that includes a contact commitment, the contact commitment date populates the Target Contact date field of the record.

## Record relationships

Relationships between records, such as tickets and work orders, help simplify record management. You can create record relationships manually, or relationships might be created automatically when you take certain actions.

The types of relationships that can exist between records include:

- Related relationship, which is an informal association of tickets that is used for informational purposes.
- Originator and Follow-up, which keep costs hierarchies separate while still creating a relationship between the tickets.
- Related to Global, which creates a relationship in which the tickets are related to a global issue, which affects many users.

## Related records

Using any ticket or work-based application, you can view similar records and relate tickets and work orders to the current record. A related relationship between records is an informal relationship that is for informational purposes only.

A related relationship does not affect status inheritance, affect workflow, or follow a set of business rules. Related relationships can be many-to-many, and do not represent record hierarchies. By relating records informally, you can navigate to related records, view related information for similar records, and view open tickets that are associated with a field. You can create an informal record relationship in the following ways:

- Use the Related Records tab of the application. This tab provides an easy way to create relationships and to view and navigate among informally related records.
- Use the Show Similar Tickets action in any ticket application. The similar ticket search results only include the service requests, incidents, and problems that have the same classification as the current ticket. Global records and history records are not included in the results. Your system administrator might add more restrictions to the search results.

## Originator and follow-up tickets and work orders

You can relate tickets and work orders to a record more directly when you create a follow-up record from the ticket using one of the Create actions on the ticket. The ticket you create the follow-up record from is the originator. A follow-up record can be a ticket or a work order. In some cases, a follow-up ticket or work order might be able to change the status of its originating ticket. An originating ticket cannot change the status of a follow-up work order, nor can a follow-up ticket change the status of the originator if there is more than one follow-up. These options are configured by the system administrator.

## Globally related tickets

A global ticket is an incident or problem relating to an issue that affects many users. You can relate tickets, including service requests, to a global ticket, which creates a RELATEDTOGLOBAL relationship. This relationship lets you manage the tickets by using the global ticket. When you change the status of the global ticket, the system changes the status of all globally related tickets.

If your administrator has set up automated notifications of status changes, the system changes the status of the tickets related to the global issue. For example, all the initial requestors reporting the same issue are notified of its resolution. On the global ticket, you can also view a list of related records and view the work and communication logs for all related records.

- [Deletion of record relationships](#)  
On the Related Records tab, you can delete the relationship between a change and any related work orders or tickets.
- [Global records](#)

A global record is a ticket that is a root cause of other issues or that affects many users, such as computer network failures or flooding in a building. After you mark a record as global, you can relate multiple tickets and then manage all tickets using the global record.

## Costs on tickets and work orders

You can view the estimated and actual costs for a single work order or ticket, including costs for labor, material, tools, and services. You can also view total costs for the current record and all the records below it in its hierarchy.

When you view the costs of a ticket or work order, the data is displayed in two tables:

- The Totals table displays the costs for a single ticket or work order.
- The View Hierarchy Grand Totals table displays the costs for the current ticket or work order and all records under its hierarchy.

Each table presents the same information, which is shown in the following table.

Column	Explanation
Current Estimate	Displays read-only calculated values for the current totals from the Labor, Materials, Standard Services, and Tools tabs of the Plans tab for the ticket or work order.

Column	Explanation
Estimate at Approval	Is set to zero until the work order is approved, then the values are copied from the Current Estimate column and are read-only. If the work order status changes from approved to unapproved, then these fields are cleared. The estimated costs at approval are not affected by the change in status from in progress to completed or closed.
Actual	Displays the read-only values from the Labor (for approved labor only), Materials, and Tools tabs of the Actuals tab. If the status of the record changes from approved, then these fields are not cleared.

## Rolling up maintenance costs

After you close a work order that is associated with an asset, you can calculate your maintenance costs by rolling up costs that you incur for labor, materials, tools, and services to the top-level asset in the hierarchy that the asset belongs to.

Costs can be rolled up manually or automatically. By default, cost rollups are manual. If you want costs to be calculated and rolled up automatically when a work order is closed, you must set the `mxe.workorder.rollupMaintenanceCosts` system property to 1. After you configure the system property for automatic rollups, all subsequent costs that are associated with work orders are rolled up automatically. However, any unprocessed maintenance costs that existed before the configuration are not automatically rolled up. You must roll up any preexisting, unprocessed maintenance costs manually.

To calculate the maintenance cost of your assets, use the Roll Up Maintenance Costs action in the Assets application.

If you upgrade to Maximo® Manage 8.5, run the Asset Cost Rollup Report to roll up pending maintenance costs before the upgrade.

## Work plan removal

Under certain circumstances, you can remove a work plan from an activity by using the Remove Work Plan action.

When you remove a work plan, all information in the Resources tab, except for non-task children, is removed. Also, if the work plan has a job plan, the job plan identifier is removed.

If any task in the work plan cannot be removed based on the deletion rules for changes, you cannot use the Remove Work Plan action. You can still delete labor, material, services, and tools information, as well as any tasks that do meet the deletion rules.

## Deletion rules for activities

For auditing purposes, you cannot always delete activities. If you cannot delete a specific activity, you can stop all action on an activity by changing the status to canceled.

The activity and its children must meet the following criteria to be deleted:

- Have a status of waiting for approval
- Not have any transactions registered against it, except for status changes
- Not have any actuals reported against it
- Not have any labor assignments associated with it
- Not have been generated for a purchase order or receipt
- It must not have any failures reported against it.
- Not be in a workflow or have ever been in a workflow
- Not have any measurements or meter readings taken against it
- Cannot be or have follow-up work

To delete an activity, use the Delete > Activity action.

## Rules for modifying archived activities

Closed and canceled activities are archived, and become historical records. You might be able to add additional information to a historical record by using the Edit History Activity action.

When you modify an archived activity, the following rules apply:

- New costs that were incurred during the edit history must be added to the inventory cost, if it is defined as charge to store.
- You can add actual labor, but you cannot change approved transactions.
- You can add actual materials and actual tools, but you cannot change them.
- You can add or delete child records, whether or not the child records are tasks.
- You can attach documents.
- You cannot change planned labor, materials, and tools.
- You cannot change information in the following fields:
  - Asset.
  - Location.
  - GL Account.
  - Charge to Store.
  - Status.
  - Status Date

---

## Working with activities

Activities are created in the Incidents and Problems applications. Tasks are created as part of activities and other work orders. You can manage and modify activities and tasks in the Activities and Tasks application. For example, you can change the ownership or status of an activity or task.

- [Planning activities and tasks](#)  
After you associate a task with an activity, you can specify estimates for labor, craft, materials, services, and tools for each task on the activity or for the activity as a whole.
- [Reporting actuals for activities and tasks](#)  
As work progresses on an approved activity or task, you can report the actual labor hours, materials, services, and tools used.
- [Applying service level agreements to records](#)  
You can apply a service level agreement (SLA) to a record to define the agreement and formal commitments between a service provider and a customer. The agreement documents the service to be provided or received, the agreed upon service levels for the service, and the means of measuring or quantifying the level of service.
- [Swapping assets](#)  
You can swap assets associated with a work order. The swap action applies to the work order and all of the assets, locations, and configuration items on its child work orders. The term "work order" can refer to a work order, change, release, or activity record.
- [Relating work orders or tickets to activities or to tasks](#)  
You can link work orders and tickets to an activity or task. When you link a record to a work order, its relationship type is RELATED.
- [Classifying activity records](#)  
To simplify the process of finding and managing activity records, you can classify the records. Categorizing an activity involves classifying it and adding and modifying attributes to further group the classification.
- [Setting up work process flows](#)  
Work process flows use relationships between work orders and tasks to automate the flow of status changes. You set relationships between work orders and tasks so that when a task is completed, the next task in the flow can be initiated.
- [Changing the status of activities or tasks](#)  
You can change the status of an activity to indicate the position of the activity as it moves toward completion.

---

## Planning activities and tasks

After you associate a task with an activity, you can specify estimates for labor, craft, materials, services, and tools for each task on the activity or for the activity as a whole.

- [Creating work plans](#)  
A work plan describes the labor, materials, tools, services, and tasks you need to complete an activity or task. You can create a work plan manually.
- [Planning work for activities and tasks](#)  
You use the Activities and Tasks application to insert, view, or edit planned labor information or planned craft information.
- [Creating tasks for activities](#)  
You use the Activities and Task application to create additional tasks or to edit the existing tasks for an activity. After you create a task, you can plan its labor, materials, services, and tools.

---

## Creating work plans

A work plan describes the labor, materials, tools, services, and tasks you need to complete an activity or task. You can create a work plan manually.

---

### Procedure

1. In the Activities and Tasks application, display the record for which you want to create a plan.
2. Make one of the following selections:

Option	Description
If the record is an activity	Click the Plans tab.
If the record is a task	Click the Resources tab, then click the Plans sub tab.

3. Specify work plan data, such as tasks, labor, materials, tools, and services using the sub tabs.
4. Save the record.

- [Creating work plans using job plans](#)  
A work plan describes the labor, materials, tools, services, and tasks you need to complete an activity. You can select a job plan, and modify it to your needs.

---

## Creating work plans using job plans

A work plan describes the labor, materials, tools, services, and tasks you need to complete an activity. You can select a job plan, and modify it to your needs.

---

### Procedure

1. In the Activities and Tasks application, display the record for which you want to create a work plan from a job plan.

2. Make one of the following selections:

Option	Description
If the record is an activity	Click the Plans tab.
If the record is a task	Click the Resources tab, then click the Plans sub tab.

3. In the Job Plan field, click Detail Menu and select an option to retrieve a value. When you associate a job plan with a work order, the product copies the labor, the materials, the services, and the tools to the work order plan. If the job plan has a default safety plan for the selected work asset, the product also copies the safety plan to the work order.
4. Optional: Edit the fields to modify any of the information. Changes you make to the work plan do not affect the original job plan.
5. Save the record.

---

## Planning work for activities and tasks

You use the Activities and Tasks application to insert, view, or edit planned labor information or planned craft information.

---

### Procedure

1. Display the activity or task for which you want to plan labor.
2. Make one of the following selections:

Option	Description
If the record is an activity	Click the Plans tab.
If the record is a task	Click the Resources tab, then click the Plans sub tab.

3. Enter the details of the planned work on the following subtabs:

Option	Description
Labor	Add hours for labor or select crafts.
Materials	Add materials, search catalogs, or add spare parts.
Services	Add services.
Tools	Add tools.

4. Save the record.

---

## Creating tasks for activities

You use the Activities and Task application to create additional tasks or to edit the existing tasks for an activity. After you create a task, you can plan its labor, materials, services, and tools.

---

### Procedure

1. Display the activity for which you want to create planned tasks.
2. In the Tasks table window on the Plans tab, click New Row.
3. Specify a unique value in the Task field.
4. To have the tasks performed in a specific order, enter the appropriate value in the Sequence field.
5. Type the amount of time needed to complete the task in the Estimated Duration field.
6. Use the Labor, Materials, Services, and Tools subtabs to plan for the task.
7. Save the activity.

---

## Reporting actuals for activities and tasks

As work progresses on an approved activity or task, you can report the actual labor hours, materials, services, and tools used.

---

### Procedure

1. Display the activity or task for which you want to report actuals.
2. Make one of the following selections:

Option	Description
If the record is an activity	Click the Plans tab.
If the record is a task	Click the Resources tab, then click the Plans sub tab.

3. Enter the details for the actuals on the following subtabs:

Option	Description
Labor	Report hours for labor, copy labor from the work plan, or select planned labor.
Materials	Select materials, select reserved items, and select spare parts.
Services	Select services or standard services.
Tools	Select tools, copy tool data from the work plan, or select tools that were issued.

4. Save the record.

---

## Applying service level agreements to records

You can apply a service level agreement (SLA) to a record to define the agreement and formal commitments between a service provider and a customer. The agreement documents the service to be provided or received, the agreed upon service levels for the service, and the means of measuring or quantifying the level of service.

### About this task

---

When you apply an service level agreement to work orders, the SLA is applied only to the work order, not to its tasks. If you want to apply a service level agreement to a task, you must display the task as the current record and then apply the SLA.

You can apply service level agreements to tickets and work orders.

### Procedure

---

1. Open an application and display the record that you want to update.
2. Select the Apply SLA action.
3. Click OK.

### Results

---

The SLA Applied check box on the main tab of the selected application is selected. The target start, target finish, and contact values are calculated for the selected record.

---

## Removing service level agreements from records

To maintain accurate records, it might be necessary to remove an invalid or erroneous service level agreement to disassociate it from the record.

### Procedure

---

1. Display the record for which you want to remove a service level agreement.
2. Select the Select/Deselect SLA action.
3. Click Mark Row for Delete for each service level agreement that you want to remove from the record.
4. Click OK.
5. Save the record.

---

## Swapping assets

You can swap assets associated with a work order. The swap action applies to the work order and all of the assets, locations, and configuration items on its child work orders. The term "work order" can refer to a work order, change, release, or activity record.

### Before you begin

---

You can execute the swap immediately, or you can save the swap as a plan. If you save the swap as a plan, the changes will apply when the status for the work order is COMP (Complete). When the status of a work order is COMP, you swap assets only using the Execute Now option. When you select Execute Now on any tab, the system executes the changes on all tabs.

When you duplicate a work order that has a planned swap to its assets or locations, the planned action does not get copied to the duplicate work order. Also, when you create a release, or change, or work order from a record using the Select Action menu option, the planned action is not copied to the follow-up record.

### Procedure

---

1. Select the Move/Swap/Modify action.
2. Click the Move/Swap tab.
3. Select the Is this an Asset Swap checkbox.
4. In the Swap Assets section, select the row for the asset you want to swap.
5. To move the asset to a parent or location, type a value in the appropriate field, or click Select Value to retrieve a value.
6. In the Replacement Asset field, specify an asset, or click Select Value to retrieve a value.
7. Perform one of the following actions:
  - To swap the assets immediately, click Execute Now.
  - To swap the assets when the status for the work order is COMP (Complete), click Save as Plan.

---

## Relating work orders or tickets to activities or to tasks

You can link work orders and tickets to an activity or task. When you link a record to a work order, its relationship type is RELATED.

## Procedure

---

1. In the Activities and Tasks application, display the record to which you want to add related records.
  2. On the Related Records tab, perform either of the following actions:
    - To relate a work order to the current record, in the Related Work Orders table window, click Add Row.
    - To relate a ticket to the current record, in the Related Tickets table window, click Add Row.
  3. Type or select a work order in the Work Order field, or specify a ticket in the Related Record Key field.
  4. Optional: You can enter a class.
  5. Save the activity.
- [Assigning a parent to a work order](#)  
You can assign a parent to a work order and assign tasks to that parent. When you assign work order records to a parent, they become child work orders records of the parent record.
  - [Removing relationships between records](#)  
You can remove the relationship between an activity or a task and its related work orders or tickets.

---

## Assigning a parent to a work order

You can assign a parent to a work order and assign tasks to that parent. When you assign work order records to a parent, they become child work orders records of the parent record.

### About this task

---

You cannot assign parent records to closed work order records. If the parent has a value in the Priority field, and the child or children work order records do not, the child or children work order records inherit the parent priority value.

## Procedure

---

1. Open an application and display the work order record that you want to update.
2. On the List tab, select the task that you want to update.
3. Select the Assign To New Parent action.
4. Select the work order record that you want as the new parent.  
The asset management system displays the parent work order number in the Parent WO field.
5. Click Save record.

---

## Removing relationships between records

You can remove the relationship between an activity or a task and its related work orders or tickets.

### Before you begin

---

You can remove the relationship between records only if the ticket or the work order has a type of RELATED.

### About this task

---

To delete relationships with work orders of other relationship types, such as FOLLOWUP or ORIGINATOR, delete the work order in any of the following applications:

- Work Order Tracking
- Activities and Tasks
- Changes
- Releases

To delete relationships with tickets of other relationship types, you must go to the tickets applications.

## Procedure

---

1. In the Activities and Tasks application, display the record with the related relationship that you want to delete.
2. On the Related Records tab, select the record in the Related Work Orders table window.
3. Click the Mark Row for Delete icon. You can mark more than one row.
4. Click Save Activity.

---

## Classifying activity records

To simplify the process of finding and managing activity records, you can classify the records. Categorizing an activity involves classifying it and adding and modifying attributes to further group the classification.

## About this task

For example, you might classify an activity as a notebook. The notebook classification might have the attributes of memory, speed, and disk space associated with it, which are copied to the record upon classification. As needed, you can add attributes such as operating system and power, change the attribute values, and remove attributes associated with the record.

## Procedure

1. In the Activities and Tasks application, display the activity record that you want to categorize.
2. Select a classification for the activity in one of the following ways:

Choice	Description
<b>Use the Classification field</b>	In the Classification field of the main application tab or on the Activities and Tasks tab, click Detail Menu and then select Classify to produce a classification hierarchy tree that you can drill down through and select a classification.
<b>Use the Class Description field</b>	In the Class Description field of the main application tab or on the Activities and Tasks tab, you can hasten the classification search as follows: <ol style="list-style-type: none"><li>a. Click the Select Value icon next to the Class Description field and enter a keyword or a word string, such as <i>Operating System</i> into the Description field of the window. All classification values that contain the keyword or word string are retrieved.</li><li>b. Click a value from the resulting list to select the classification.</li></ol>

3. Optional: You can view the attributes that are associated with the selected classification in the Attributes table window. You can also add, delete, and change the values of the attributes in the row details.
4. Save the activity.  
The full classification path appears in the Classification field, where you can view all nodes of the classification.

## Setting up work process flows

Work process flows use relationships between work orders and tasks to automate the flow of status changes. You set relationships between work orders and tasks so that when a task is completed, the next task in the flow can be initiated.

## Before you begin

To set the process flow for individual tasks, you must select Under Flow Control at the header level for the work order.

## About this task

The best practice for consistently using the flow feature is to set up the process flow as a work template at the job plan level.

## Procedure

1. Open the work order.
2. Select Under Flow Control.
3. On the Plans tab, display the details for the task.
4. In the Scheduling Information section, next to the Predecessors field, click the Detail Menu icon.
5. Select the tasks that must be completed before this task is initiated.
6. Save the work order.

- **Defining flow actions**

A flow action is used in a work process flow to define certain actions that should occur while work is being done. Actions or action groups can be applied to any work order, task, or job plan task.

- **Removing work process flow from work orders or job plans**

You can remove work process flow for a work order, a job plan, or task records that have it defined. You can do this at the header level, which will remove it for all the associated tasks as well, or you can remove it at the task level.

- **Suspending work process flows**

You can suspend the work process flow for work order or task records that have it defined. For example, if you want to start a work order or task manually, you could suspend the flow control on that record. The flow remains suspended until you remove the suspension.

- **Stopping workflow processes**

You can stop a workflow process for a record. You use the Workflow Administration application to view and stop workflow processes.

## Defining flow actions

A flow action is used in a work process flow to define certain actions that should occur while work is being done. Actions or action groups can be applied to any work order, task, or job plan task.

## About this task

You can determine whether the action takes place automatically, or if the action only takes place when it is initiated manually. When automatic, the action takes place as soon as the work order or task status is changed to an in progress (INPRG) status value by work process flow. When manual, you must initiate the flow action by running the automation or processing scripts or placing an action button on the target application. Actions and action groups are defined in the Actions application.

## Procedure

1. In an application that supports flow action, display the record for which you want to define a flow action.
2. Perform one of the following actions:
  - For a work order, change, release, or job plan record, enter a value in the Flow Action field on the application tab.
  - For a work order or job plan task, enter a value in the Flow Action field in the Task table window. The Tasks table window is found on the main tab of the Job Plans application, or the Plans tab of the Work Order Tracking, Changes, and Releases applications.The defined action runs when the work order or task status value is changed to INPRG.
3. Specify whether you want the flow action to be automatically run:

Option	Flow Action Assist
Automatically run the flow action	Cleared
Manually run the flow action	Selected
4. Click Save record.

## Removing work process flow from work orders or job plans

You can remove work process flow for a work order, a job plan, or task records that have it defined. You can do this at the header level, which will remove it for all the associated tasks as well, or you can remove it at the task level.

## About this task

If work process flow is removed at the header level, it will automatically be removed on individual tasks on the record. You cannot retain work process flow for a task that does not have it set at the header level.

## Procedure

1. In an application that supports flow action, display the record that you want to remove from work process flow.
2. On the main application tab, clear the Flow Controlled check box. The system removes the work order or the job plan, and all of its tasks from work process flow.
3. Click Save Record.

## Suspending work process flows

You can suspend the work process flow for work order or task records that have it defined. For example, if you want to start a work order or task manually, you could suspend the flow control on that record. The flow remains suspended until you remove the suspension.

## Before you begin

Removing the suspension restarts the flow. Any successor work orders or tasks with completed predecessors continue the process. Work orders and tasks without predecessors continue the process at the same time as the parent record. The last completed child under a parent rolls its completion up to the parent.

## Procedure

1. In an application that supports flow action, display the record on which you want to suspend flow control.
2. On the main application tab, at the header level, select the Suspend Flow Control check box. The system suspends the work process flow on the work order and on all of its tasks.
3. To retain flow control for individual tasks, display the tasks in the Tasks table window, and clear the Suspend Flow Control check box at the task level. Flow control remains in place at the task level. This action does not affect the suspension at the work order header level. You can find the Tasks table window on the Plans tab.
4. Click Save Record.

## Example

You generally suspend a set of tasks, often under the same parent. For example, you can delay the automatic starting of one whole phase of work until a certain condition has been met. You can also delay starting a phase of work to make changes to the tasks, such as inserting tasks, deleting tasks, and changing the precedence logic.

## Changing the status of activities or tasks

You can change the status of an activity to indicate the position of the activity as it moves toward completion.

## Procedure

---

1. In the Service Requests, in the Problems, or in Incidents application that corresponds to the type of record you are managing, display the record whose status you want to change.
2. Select the Change Status action.
3. In the New Status field, choose a status from the pull-down menu.
4. Click OK to change the status.

## What to do next

---

If you change a ticket to a RESOLVED status, and you are the designated owner of that ticket, you might want to stop the timer or otherwise report the time that you spent resolving the issue.

## Service Requests

---

You use the Service Requests application to manage requests for services that involve an asset or location in your enterprise. For example, you might receive a request to upgrade the computer software on the notebook for a user, or for all users at certain locations.

Service requests include requests that are communicated to you directly from a user, for example from a phone call, e-mail message, or direct contact. You also receive service requests from self-service users who create requests using the Create Service Request application. Other service requests might originate from an automated workflow process.

The owner of a service request is responsible for managing the ticket to completion. You can assign the ownership of a service request to another person or a workgroup. If you are the logged-in user, you can take ownership of the request and complete it yourself. You, or the assigned owner, can update the service request as more details are known about it.

For example, you can identify who the service affects and what priority it has. You can specify who the service request might be escalated to if issues arise and change the status of the request as it moves toward completion. You can apply service level agreements to the service request so that related legal and contact information is readily available. All communication that pertains to the service request can be stored in the log of the service request to provide a clear history of its lifecycle.

## Example of a service request that involve multiple assets and locations

---

A service request might involve a high-level task, such as installing graphic software on all the notebooks that belong to Product Managers. To complete this task, a service technician needs to know who the product managers are and where their notebooks are located. You can identify all this information using the features on the Service Request tab.

For example, you can identify *Project Managers' Notebooks* as the primary affected asset using the Service Request Details section. You can then identify each Product Manager and the location and details of each notebook using the Multiple Assets, Locations, and CIs section.

- [Service requests overview](#)  
A service request record captures information about a request, including the type of service, who needs it, where, when, and why. You use the Service Requests application to manage requests for services that involve an asset or location in your enterprise.
- [Working with service requests](#)  
You can create service requests either in the Service Requests application or as records related to other tickets or work orders. You can apply service level agreements, categorize requests, create relationships with other records, assign and record labor activities, and log actions and communications.

## Service requests overview

---

A service request record captures information about a request, including the type of service, who needs it, where, when, and why. You use the Service Requests application to manage requests for services that involve an asset or location in your enterprise.

- [Service request management](#)  
A service request captures information about the service being requested by a user, including the type of service that is needed, when it is needed, and why it is needed. Managing service requests involves creating, updating, assigning, escalating, and resolving requests for service on an asset or a location in your enterprise.
- [Service request templates](#)  
A service request template contains predefined data that you can insert in common, high-volume service request records. Applying templates can significantly reduce the amount of time needed to create service requests.
- [Service level agreements](#)  
A service level agreement (SLA) typically is a written agreement that outlines the commitment between a service provider and its customers. A commitment is a service level that all parties have agreed to, such as asset reliability or availability.
- [Record relationships](#)  
Relationships between records, such as tickets and work orders, help simplify record management. You can create record relationships manually, or relationships might be created automatically when you take certain actions.
- [Service request categorization](#)  
To simplify the task of retrieving and managing service requests, you can categorize the requests using classifications. Most classifications have attributes associated with them that group the classification further. You can add, change, or delete the attributes at any time, or you can reclassify the request to obtain a new set of attributes.

- [Ticket statuses](#)  
Every ticket has a status that indicates its position as it moves toward completion. Changes to the ticket status can happen automatically or manually.
- [Costs on tickets and work orders](#)  
You can view the estimated and actual costs for a single work order or ticket, including costs for labor, material, tools, and services. You can also view total costs for the current record and all the records below it in its hierarchy.
- [Linear segment details](#)  
You use the Linear Segment Details section to locate a linear segment or point on a linear asset. The Linear Segment Details section, which displays on tabs in several applications, appears only if you are working with a linear asset.
- [Restrictions on deleting tickets](#)  
You can delete a ticket only when it has a certain status and only when transactions have not been recorded for it.

## Service request management

A service request captures information about the service being requested by a user, including the type of service that is needed, when it is needed, and why it is needed. Managing service requests involves creating, updating, assigning, escalating, and resolving requests for service on an asset or a location in your enterprise.

A service request can be created and managed in several ways.

Method of service request creation	Description
Service Requests application	Used by service desk agents or users in a similar role, who are authorized to create and manage service requests.
Create Service Request application	Used by self-service users who are requesters who can register themselves on the system without the assistance of an agent, and create a service request. The request is then managed by an agent using the Service Requests application. Self-service users also can use the View Service Request application to view the status of their service request as it progresses toward completion.
Automatic	Your system administrator can configure the system to create service requests from sources such as e-mail, system monitoring tools, or external applications, and assign them to people or work groups for resolution.

## Service request templates

A service request template contains predefined data that you can insert in common, high-volume service request records. Applying templates can significantly reduce the amount of time needed to create service requests.

If you select and apply a template to a service request record, it overwrites existing data in the record. If there is data in a Service Request field but no data in the corresponding field on the template, the template does not delete the existing data. You can modify the applied information until the service request is in a resolved or closed status.

## Service level agreements

A service level agreement (SLA) typically is a written agreement that outlines the commitment between a service provider and its customers. A commitment is a service level that all parties have agreed to, such as asset reliability or availability.

The SLA describes one or more commitments and the escalation actions or notifications associated with each commitment. Escalation actions or notifications might be associated with an SLA to ensure that commitments are met. An escalation process can monitor all activities and send notifications or perform other activities to ensure that commitments are met.

The types of records to which service level agreements can be applied include tickets, such as service requests, and work-based records, such as work orders. Before you can apply an SLA to a record, the record must have a site defined.

A service level agreement can be associated with a record in several ways:

- An SLA might automatically be applied to a record from within a workflow or escalation process, or from another SLA.
- You can select an action to apply an SLA, which applies the best match automatically.
- You can view SLAs and select an action to select or clear the SLAs that you want to manually apply to the record.

When you apply a service level agreement to a record, the following events occur:

- The SLA Applied check box on the main tab of the record is selected to document the action.
- Any escalations that are associated with the SLA are activated.
- The Target Start, Target Finish, and Contact values for the record might be calculated automatically as follows:

Automatically calculated values
When an SLA is applied that includes a response commitment, the response commitment date populates the Target Start date field of the record.
When an SLA is applied that includes a resolution commitment, the resolution commitment date populates the Target Finish date field of the record.
When an SLA is applied that includes a contact commitment, the contact commitment date populates the Target Contact date field of the record.

## Record relationships

Relationships between records, such as tickets and work orders, help simplify record management. You can create record relationships manually, or relationships might be created automatically when you take certain actions.

The types of relationships that can exist between records include:

- Related relationship, which is an informal association of tickets that is used for informational purposes.
- Originator and Follow-up, which keep costs hierarchies separate while still creating a relationship between the tickets.
- Related to Global, which creates a relationship in which the tickets are related to a global issue, which affects many users.

## Related records

---

Using any ticket or work-based application, you can view similar records and relate tickets and work orders to the current record. A related relationship between records is an informal relationship that is for informational purposes only.

A related relationship does not affect status inheritance, affect workflow, or follow a set of business rules. Related relationships can be many-to-many, and do not represent record hierarchies. By relating records informally, you can navigate to related records, view related information for similar records, and view open tickets that are associated with a field. You can create an informal record relationship in the following ways:

- Use the Related Records tab of the application. This tab provides an easy way to create relationships and to view and navigate among informally related records.
- Use the Show Similar Tickets action in any ticket application. The similar ticket search results only include the service requests, incidents, and problems that have the same classification as the current ticket. Global records and history records are not included in the results. Your system administrator might add more restrictions to the search results.

## Originator and follow-up tickets and work orders

---

You can relate tickets and work orders to a record more directly when you create a follow-up record from the ticket using one of the Create actions on the ticket. The ticket you create the follow-up record from is the originator. A follow-up record can be a ticket or a work order. In some cases, a follow-up ticket or work order might be able to change the status of its originating ticket. An originating ticket cannot change the status of a follow-up work order, nor can a follow-up ticket change the status of the originator if there is more than one follow-up. These options are configured by the system administrator.

## Globally related tickets

---

A global ticket is an incident or problem relating to an issue that affects many users. You can relate tickets, including service requests, to a global ticket, which creates a RELATEDTOGLOBAL relationship. This relationship lets you manage the tickets by using the global ticket. When you change the status of the global ticket, the system changes the status of all globally related tickets.

If your administrator has set up automated notifications of status changes, the system changes the status of the tickets related to the global issue. For example, all the initial requestors reporting the same issue are notified of its resolution. On the global ticket, you can also view a list of related records and view the work and communication logs for all related records.

- [Deletion of record relationships](#)  
On the Related Records tab, you can delete the relationship between a change and any related work orders or tickets.
- [Global records](#)  
A global record is a ticket that is a root cause of other issues or that affects many users, such as computer network failures or flooding in a building. After you mark a record as global, you can relate multiple tickets and then manage all tickets using the global record.

---

## Global records

A global record is a ticket that is a root cause of other issues or that affects many users, such as computer network failures or flooding in a building. After you mark a record as global, you can relate multiple tickets and then manage all tickets using the global record.

The following features, conditions, and restrictions pertain to using and managing global records:

- When you display a global record, and select the Show Similar Tickets action in the toolbar, you can view all tickets that are related to the global record. You also can select tickets and relate them to the global ticket.
- A record can be a global ticket or related to a global ticket, but not both.
- You can view the work and communication logs for all related records from the global record.
- If you change the status of a global record, the statuses of all globally related tickets change accordingly.
- Records that are created as follow-up records from the global record cannot be related to it as a global record.
- You cannot manage follow-up records from the global record.
- You cannot relate any record to a global record that is archived as a history record.
- You cannot designate a record as global if it is already related to a global record or it is a history record.
- You can remove the global flag from a global record that has tickets related to it, but you must first remove the value in the Related to Global ID field for each ticket that is related to the global record. You can do so using the Related Records tab of the global record.

---

## Service request categorization

To simplify the task of retrieving and managing service requests, you can categorize the requests using classifications. Most classifications have attributes associated with them that group the classification further. You can add, change, or delete the attributes at any time, or you can reclassify the request to obtain a new set of attributes.

For example, a service request might involve first classifying the request by technical area, such as hardware, software, or network. If a user selects the software classifications, further classifications might allow the specification of the exact software type and version.

You can specify values for the attributes. Classifying service requests also supports the integration of service requests with related workflow processes, escalations, and service level agreements.

---

## Ticket statuses

Every ticket has a status that indicates its position as it moves toward completion. Changes to the ticket status can happen automatically or manually.

If you change the status of a global ticket, then the same status change is automatically made to all related tickets.

Status changes can happen automatically as the result of workflows. For example, you can create a workflow that changes the status to QUEUED automatically when a ticket is assigned to an owner for resolution. Workflows can also result in tickets being automatically routed, escalated, reported to another party, or closed.

In some cases, such as that of related records, changing the status of a follow-up record might change the status of its originating record. The service desk administrator configures these options.

Your system administrator can add, remove, or change the names of the basic statuses.

### NEW

The default status that is applied when a ticket is created or inserted. You cannot return a ticket to this status after you change it.

### QUEUED

The ticket is in the queue and work can begin on it.

### INPROG

Work on the ticket is ongoing.

### PENDING

The ticket is pending an action. For example, work cannot continue until a part is received.

### RESOLVED

Information was gathered and routed, service was restored, or a solution was provided. When the status of a record changes to RESOLVED, the status of all the activities in that record changes to COMPLETE.

### CLOSE

A closed record is a historical archive and you cannot change its status. You can, however, change editable fields of the archived record. When the status of a record changes to CLOSED, the system changes the status of all activities in that record to CLOSED.

---

## Costs on tickets and work orders

You can view the estimated and actual costs for a single work order or ticket, including costs for labor, material, tools, and services. You can also view total costs for the current record and all the records below it in its hierarchy.

When you view the costs of a ticket or work order, the data is displayed in two tables:

- The Totals table displays the costs for a single ticket or work order.
- The View Hierarchy Grand Totals table displays the costs for the current ticket or work order and all records under its hierarchy.

Each table presents the same information, which is shown in the following table.

Column	Explanation
Current Estimate	Displays read-only calculated values for the current totals from the Labor, Materials, Standard Services, and Tools tabs of the Plans tab for the ticket or work order.
Estimate at Approval	Is set to zero until the work order is approved, then the values are copied from the Current Estimate column and are read-only. If the work order status changes from approved to unapproved, then these fields are cleared. The estimated costs at approval are not affected by the change in status from in progress to completed or closed.
Actual	Displays the read-only values from the Labor (for approved labor only), Materials, and Tools tabs of the Actuals tab. If the status of the record changes from approved, then these fields are not cleared.

---

## Rolling up maintenance costs

After you close a work order that is associated with an asset, you can calculate your maintenance costs by rolling up costs that you incur for labor, materials, tools, and services to the top-level asset in the hierarchy that the asset belongs to.

Costs can be rolled up manually or automatically. By default, cost rollups are manual. If you want costs to be calculated and rolled up automatically when a work order is closed, you must set the `mxe.workorder.rollupMaintenanceCosts` system property to 1. After you configure the system property for automatic rollups, all subsequent costs that are associated with work orders are rolled up automatically. However, any unprocessed maintenance costs that existed before the configuration are not automatically rolled up. You must roll up any preexisting, unprocessed maintenance costs manually.

To calculate the maintenance cost of your assets, use the Roll Up Maintenance Costs action in the Assets application.

If you upgrade to Maximo® Manage 8.5, run the Asset Cost Rollup Report to roll up pending maintenance costs before the upgrade.

---

## Linear segment details

You use the Linear Segment Details section to locate a linear segment or point on a linear asset. The Linear Segment Details section, which displays on tabs in several applications, appears only if you are working with a linear asset.

For example, if you specify a linear asset in the Asset field on a preventive maintenance record, the PM tab displays a Linear Segment Details section. If you enter a point asset, the PM tab does not display this section. The Linear Segment Details section includes fields for both the start point and the end point. If you locate a point, such as a stop sign, the start and the end points are the same.

The following terms are associated with linear segments:

#### Measure

The absolute distance from the start of a linear asset. You can specify a measure manually. The measure is calculated for you if you enter a reference point and a reference point offset. In the example, using Mile Post 27 and an offset of -528, the calculated measure is 26.9 miles (528 feet = .1 mile).

#### Offset

A measure from a previously defined reference point. The possible kinds of offsets are the following:

##### Reference Point Offset

The distance before or after the reference point. Specify an offset value if the segment start or end is before or after the reference point. The value can be negative (before) or positive (after). For example, if the start of the segment is 528 feet before Mile Post 27, type -528.

You cannot specify an offset that, when combined with the reference point, yields a measure that is outside the boundaries of the linear asset. For example, if reference point Mile Post 1 is at 1.0 miles on a linear asset that begins at 0.0 miles, you cannot enter an offset of -2 miles.

##### Y-Offset

A distance perpendicular to the direction of the linear asset. For example, a speed limit sign is located 10 feet from the right edge of the road. "Right" is positive and "left" is negative. Therefore, the Y offset is 10.

##### Z-Offset

A distance above a linear asset or below a linear asset. For example, an exit sign is located 18 feet above the surface of the road, and a culvert is 4 feet below the surface of the road. The Z offset for the sign is 18, and the Z Offset for the culvert is -4.

#### Reference point

A feature instance that you can use as a starting point or as an ending point for a linear segment. A reference point is a means of communicating a work location. For example, it can be more useful to workers to say that roadside plowing on Route 96 begins at the intersection of Routes 96 and 75, and ends at Exit 34. It would be less useful to say the work begins at Mile 27.85 and ends at Mile 33.8.

The use of reference points varies according to department practices and to individual variation among linear assets. Some roads might have accurate and persistent mile post markers and workers can rely on them to locate work. Other roads might have few markers or no accurate markers, and users can rely on reference points. Use labels that maintenance workers in the field can easily identify.

Click Select Value to select the reference point.

#### Y Reference

The point from which the Y Offset is measured.

The system administrator creates the set of Y Reference values by creating a domain in the Domains application. For roads, some common examples include midline, outer pavement edge, and inner pavement edge. For example, a stop sign is located not just 20 feet from a road, but 20 feet from the midline of a road.

#### Z Reference

The point from which the Z Offset is measured.

The system administrator creates the set of Z Reference values by creating a domain in the Domains application. For roads, some common examples include road surface and road bed. For example, an exit sign is located 18 feet above the road surface, or a culvert is 12 feet below the road bed.

---

## Restrictions on deleting tickets

You can delete a ticket only when it has a certain status and only when transactions have not been recorded for it.

---

### Status-related restrictions

You can delete a ticket only if it has one of the following statuses:

- NEW.
- QUEUED.

---

### Transaction and record restrictions

You cannot delete a ticket that has the following types of transactions or records associated with it:

- Labor transactions
- Workflow history
- Child activities, although you can delete the activities and then delete the record
- Related records
- Is related to another record
- Is the originating record for another record
- Work log entries

---

## Working with service requests

You can create service requests either in the Service Requests application or as records related to other tickets or work orders. You can apply service level agreements, categorize requests, create relationships with other records, assign and record labor activities, and log actions and communications.

- [Creating service requests](#)  
You create a service request to capture information about a request, including the type of service, who needs it, where, when, and why.
- [Relating records to other records](#)  
You can relate records to each other in a ticket or work order application. For example, you can select a work order and relate it to a service request. Relating records creates a relationship type of RELATED between the records.
- [Changing the status of a list of records](#)  
You can change the status of multiple records in applications.
- [Changing archived tickets](#)  
After a ticket is closed, it is archived. To ensure that important information is maintained on historical records, you can open an archived record and change the editable fields.

---

## Creating service requests

You create a service request to capture information about a request, including the type of service, who needs it, where, when, and why.

### Procedure

---

1. In the Service Requests application, click the New Service Request icon.
  2. Specify the details of the service request.
  3. Save the record.
- [Applying service level agreements to records](#)  
You can apply a service level agreement (SLA) to a record to define the agreement and formal commitments between a service provider and a customer. The agreement documents the service to be provided or received, the agreed upon service levels for the service, and the means of measuring or quantifying the level of service.
  - [Removing service level agreements from records](#)  
To maintain accurate records, it might be necessary to remove an invalid or erroneous service level agreement to disassociate it from the record.
  - [Classifying records](#)  
You can apply a classification to a record to structure it into an organized hierarchy. You can use classifications and attributes to locate records, and help to ensure that records are not duplicated unintentionally.
  - [Adding activities to service requests](#)  
You add activities to service requests to specify the work needed to resolve the service request. These work activities are typically performed by another internal group or by a vendor, while overall management of the service request is maintained elsewhere.
  - [Creating records from existing records](#)  
To create a relationship between two records, you can create a record from an existing record. The record from which you create a change has a relationship type of ORIGINATOR, and the new record has a relationship type of FOLLOWUP.

---

## Applying service level agreements to records

You can apply a service level agreement (SLA) to a record to define the agreement and formal commitments between a service provider and a customer. The agreement documents the service to be provided or received, the agreed upon service levels for the service, and the means of measuring or quantifying the level of service.

### About this task

---

When you apply an service level agreement to work orders, the SLA is applied only to the work order, not to its tasks. If you want to apply a service level agreement to a task, you must display the task as the current record and then apply the SLA.

You can apply service level agreements to tickets and work orders.

### Procedure

---

1. Open an application and display the record that you want to update.
2. Select the Apply SLA action.
3. Click OK.

### Results

---

The SLA Applied check box on the main tab of the selected application is selected. The target start, target finish, and contact values are calculated for the selected record.

---

## Removing service level agreements from records

To maintain accurate records, it might be necessary to remove an invalid or erroneous service level agreement to disassociate it from the record.

---

## Procedure

1. Display the record for which you want to remove a service level agreement.
2. Select the Select/Deselect SLA action.
3. Click Mark Row for Delete for each service level agreement that you want to remove from the record.
4. Click OK.
5. Save the record.

---

## Classifying records

You can apply a classification to a record to structure it into an organized hierarchy. You can use classifications and attributes to locate records, and help to ensure that records are not duplicated unintentionally.

---

### About this task

You can create one or more classification hierarchies in the Classifications application. You can apply classifications to many record types.

---

## Procedure

1. Open an application and select the record that you want to update.
2. In the Classification field, select Detail Menu > Classify.
3. Click a classification category.  
You can open additional levels of the classification until you find the desired classification category.
4. Click Select Record to return a value to the Classification field.
5. Click Save record.

---

## Adding activities to service requests

You add activities to service requests to specify the work needed to resolve the service request. These work activities are typically performed by another internal group or by a vendor, while overall management of the service request is maintained elsewhere.

---

## Procedure

1. In the Service Requests application, display the service request to which you want to add an activity.
  2. In the Time Tracking table window, click New Row.
  3. Select an activity work order.
  4. Save the record.
- [Reporting labor time for activities on tickets](#)  
You can manually record the labor time that you spend resolving individual activities that are identified on a ticket.
  - [Reporting labor time using the Start and Stop timers](#)  
You can use the automatic time-tracking features of the system to help you report the time spent working on a ticket or work record.
  - [Classifying records](#)  
You can apply a classification to a record to structure it into an organized hierarchy. You can use classifications and attributes to locate records, and help to ensure that records are not duplicated unintentionally.
  - [Selecting labor for activities on tickets](#)  
To record the labor resources assigned to each activity on a ticket, you can select labor for each activity and create a labor transaction.

---

## Reporting labor time for activities on tickets

You can manually record the labor time that you spend resolving individual activities that are identified on a ticket.

---

### Procedure

1. Display the ticket that contains the activity for which you want to record labor time.
2. On the Service Request tab, in the Time Tracking table window, select the activity for which you want to add a time entry.
3. Specify the details.
4. Save the record.

---

## Reporting labor time using the Start and Stop timers

You can use the automatic time-tracking features of the system to help you report the time spent working on a ticket or work record.

## Procedure

---

1. Open the record.
2. On the toolbar, click the Start Timer button.
3. To stop the timer, click the Stop Timer button.
4. Optional: If necessary, you can edit the finish date, finish time, or hours.
5. Click OK.

---

## Classifying records

You can apply a classification to a record to structure it into an organized hierarchy. You can use classifications and attributes to locate records, and help to ensure that records are not duplicated unintentionally.

### About this task

---

You can create one or more classification hierarchies in the Classifications application. You can apply classifications to many record types.

## Procedure

---

1. Open an application and select the record that you want to update.
2. In the Classification field, select Detail Menu > Classify.
3. Click a classification category.  
You can open additional levels of the classification until you find the desired classification category.
4. Click Select Record to return a value to the Classification field.
5. Click Save record.

---

## Selecting labor for activities on tickets

To record the labor resources assigned to each activity on a ticket, you can select labor for each activity and create a labor transaction.

## Procedure

---

1. Display the record that contains the activities for which you want to select labor.
2. On the main tab of the application, in the Time Tracking table window, select the activity for which you want to select labor.
3. Specify the details of the labor you are adding.
4. Save the record.

---

## Creating records from existing records

To create a relationship between two records, you can create a record from an existing record. The record from which you create a change has a relationship type of ORIGINATOR, and the new record has a relationship type of FOLLOWUP.

## Procedure

---

1. Display the record from which you want to create the related record.
2. Select the Create > Record Type action where Record Type is the type of related record you want to create.
3. Save the record.

---

## Relating records to other records

You can relate records to each other in a ticket or work order application. For example, you can select a work order and relate it to a service request. Relating records creates a relationship type of RELATED between the records.

- [Relating ticket and work order records](#)  
To help simplify record management, you can relate tickets or work orders to other tickets or work-related records using the Related Records tab of a ticket or work order application
- [Deleting relationships](#)  
When you determine that the record you are managing is no longer related to other tickets or work-related records, you can remove the relationship using the Related Records tab.
- [Removing global issue flags](#)  
If you have erroneously marked a record as global and then related tickets to the global record, you can remove the global flag on the record only after you remove the identifier for the global record in all related records.

---

## Relating ticket and work order records

To help simplify record management, you can relate tickets or work orders to other tickets or work-related records using the Related Records tab of a ticket or work order application

### Procedure

---

1. Display the record to which you want to relate other tickets and work orders.
2. On the Related Records tab, in the Related Tickets section, select the tickets that you want to relate to the current record.
3. In the Related Work Orders section, select the work orders that you want to relate to the current record.
4. Save the record.

---

## Deleting relationships

When you determine that the record you are managing is no longer related to other tickets or work-related records, you can remove the relationship using the Related Records tab.

### Procedure

---

1. Display the record that has the relationship that you want to delete.
2. Click the Related Records tab, and then delete the ticket.
3. Save the record.

---

## Removing global issue flags

If you have erroneously marked a record as global and then related tickets to the global record, you can remove the global flag on the record only after you remove the identifier for the global record in all related records.

### Procedure

---

1. Display the record for which you want to remove the global flag.
2. Click the Related Records tab.
3. For each related record, click the Detail Menu icon and select *Go To Application* where *Application* is the application for that type of record.
4. Remove the value in the Related to Global ID field.
5. Save the record.
6. After removing the relationship from all relevant records, display the global record and clear the Global Issue check box.
7. Save the record.

---

## Changing the status of a list of records

You can change the status of multiple records in applications.

### Procedure

---

1. In the Work Order application, on the List tab of an application, filter the records so that less than 200 records are displayed.
2. Scroll down the bottom of the screen and select the Select Records check box.  
The screen refreshes and each row now has a check box.
3. Select the check boxes for the work orders whose status you want to change.
4. Click the Change Status action and enter the information in the dialog box.
5. Click OK to close the Change Status window.

---

## Changing archived tickets

After a ticket is closed, it is archived. To ensure that important information is maintained on historical records, you can open an archived record and change the editable fields.

### Procedure

---

1. Display the record whose history you want to edit.
2. Select the Edit History action.

3. Change the ticket.
4. Save the record.

---

## Ticket Templates

Applying standardized templates to common and high-volume tickets saves time by letting the system populate values from the template into fields on the ticket. You create and manage templates using the Ticket Templates application.

For other users to apply a ticket template, the template must be in an ACTIVE status, and the template class must match the ticket class. In addition, you can specify a site on a ticket template when you create it. The template is then included in the list of available templates for organizations associated with that site. The list also includes templates that do not have an organization defined.

---

### Example

For example, an IT service provider receives a large quantity of requests to set up a home virtual private network (VPN) with a cable modem. As an administrator, you create a ticket template to handle these common VPN service requests.

When Sandra in Support receives a call for VPN information, she creates a service request and applies the VPN ticket template to the record. The system automatically categorizes the ticket, sets the internal priority, and supplies any other predefined values in the fields of the record.

A series of predefined steps always occurs to support access to the VPN. You can create these activities or include existing job plans on your template. The system automatically generates these activities when Sandra applies the template, including any materials, time, labor, and services from a job plan.

- [Ticket templates overview](#)  
Standardized ticket templates save time and make service desk operations more efficient. Applying a ticket template to a record results in data automatically appearing in some fields on the ticket .
- [Working with ticket templates](#)  
You can create ticket templates in the Ticket Templates application. After a template is created, you must change the status to ACTIVE to allow other users to use the template.

---

## Ticket templates overview

Standardized ticket templates save time and make service desk operations more efficient. Applying a ticket template to a record results in data automatically appearing in some fields on the ticket .

- [Ticket classes](#)  
When you create a template in the Ticket Templates application, you classify the type by choosing from one of three classes of tickets. The class of the ticket defines the purpose of the ticket.
- [Ticket template activities](#)  
To document the work activities that are required to complete a service request or resolve a ticket, you can create a ticket template. You can then manually add activities to the template. Optionally, you can add a job plan to the template to use an existing set of activities.
- [Ticket template statuses](#)  
When you create a ticket template, the template is given a status of DRAFT. You can use the Change Status action to change the ticket template status to ACTIVE or INACTIVE to manage the accessibility of ticket templates.

---

## Ticket classes

When you create a template in the Ticket Templates application, you classify the type by choosing from one of three classes of tickets. The class of the ticket defines the purpose of the ticket.

### Service Request

A service request (SR) is generally a request for information, help, or service. It acts as a mechanism for capturing requests and assigning work. Some service desk organizations might choose to open an SR for all incoming requests, whereas others might open incident or problem records directly from a call.

### Problem

A problem is an issue with an unknown cause. After the cause of a problem is identified, any new tickets that a user creates for the same problem can be flagged as a "known problem."

### Incident

An incident is a disruption to normal service. When an incident ticket is created, the goal is to restore normal service as soon as possible.

---

### Example

The notebook of an employee fails. The employee calls IT to report the failure, and a user opens a service request ticket to document the request. After the service request is assigned to an owner, who then creates an incident ticket. The Incident ticket specifies the replacement of the notebook, which reinstates normal service as soon as possible. Next, the service request owner creates a problem ticket to diagnose the problem with the notebook, and finally a change work order to repair it.

---

## Ticket template activities

To document the work activities that are required to complete a service request or resolve a ticket, you can create a ticket template. You can then manually add activities to the template. Optionally, you can add a job plan to the template to use an existing set of activities.

When you apply a template to a ticket, the system automatically generates the following work orders:

- Generates child activity work order for each activity defined in the template.
- If a job plan is defined, then a child activity work order is generated that is based on attributes defined in the job plan.

### Example

Your organization needs a ticket template that users can apply to a service request when a new employee is hired. You create a ticket template called New Employee for the owner group HR. You assign this ticket template to the IT service group. You include in the template four activities that need to be performed, in the proper sequence:

Sequence	Description
10	Create a security badge
20	Create IT accounts
30	Issue PC
40	Issue cell phone

If you have a job plan that already includes these four activities, you can add the single job plan. You can only reference job plans that have a status of ACTIVE.

---

## Ticket template statuses

When you create a ticket template, the template is given a status of DRAFT. You can use the Change Status action to change the ticket template status to ACTIVE or INACTIVE to manage the accessibility of ticket templates.

A ticket template can have one of the following statuses:

Ticket template status	Description
DRAFT	When you create a ticket template, the system sets the status of the ticket template to DRAFT. Use this status while you are in the process of creating or finalizing the new template. Once you move the template out of DRAFT status, you cannot set it back to DRAFT.
ACTIVE	When you are ready for the template to be available to other users, change the status to ACTIVE. Only templates with an ACTIVE status can be applied by other users to a ticket record.
INACTIVE	Change the template status to INACTIVE for reasons such as: <ul style="list-style-type: none"><li>• You do not want users to have access to the template.</li><li>• You are currently not using the template.</li><li>• You want to keep a record of for historical purposes.</li></ul>

---

## Working with ticket templates

You can create ticket templates in the Ticket Templates application. After a template is created, you must change the status to ACTIVE to allow other users to use the template.

- [Creating ticket templates](#)  
You can create a template and apply it to a ticket as a quick way to add repetitive information to common or high-volume tickets, rather than entering this data manually.
- [Classifying ticket templates](#)  
When you classify ticket templates, you group related templates into classes, which makes it easier to find ticket templates. You can classify and modify the classification of a ticket template until the status of the ticket template is set to closed.
- [Categorizing ticket template activities with classifications and attributes](#)  
Categorizing activities involves classifying them and might involve adding and modifying attributes to further group the classification. For example, you can classify an activity by functional area, such as IT, facilities, or telecommunications. You can add attributes, change the attribute values, and remove attributes associated with the activity.
- [Duplicating ticket templates](#)  
When you duplicate a template, the system copies all the information from the existing template but inserts a new template ID and sets the status to draft. Duplicating a ticket template is useful when you want to create a new template that is similar to an existing template.

---

## Creating ticket templates

You can create a template and apply it to a ticket as a quick way to add repetitive information to common or high-volume tickets, rather than entering this data manually.

## Procedure

---

1. In Ticket Templates application, click New Template icon.
2. In the Class field, specify the class of ticket for which this template is intended, such as Service Request, Problem, or Incident.
3. Specify the details for the template.
4. Save the template.

## What to do next

---

To use the new template, you must change the status of the template to ACTIVE.

---

## Classifying ticket templates

When you classify ticket templates, you group related templates into classes, which makes it easier to find ticket templates. You can classify and modify the classification of a ticket template until the status of the ticket template is set to closed.

## Procedure

---

1. In the Ticket Templates application, open the ticket template that you want to classify.
2. In the Classification field, click the Details Menu icon, and then select Classify.
3. Locate the correct classification.
4. Save the record.

---

## Categorizing ticket template activities with classifications and attributes

Categorizing activities involves classifying them and might involve adding and modifying attributes to further group the classification. For example, you can classify an activity by functional area, such as IT, facilities, or telecommunications. You can add attributes, change the attribute values, and remove attributes associated with the activity.

## Procedure

---

1. In the Ticket Templates application, display the record that contains the activity you want to categorize.
2. If the Classification field is empty, specify a type of class to associate with the record.
3. In the Activities table window, select the activity.
4. Specify a classification path.
5. Optional: On the Specifications tab, you can add attributes, delete attributes, and change the values of the attributes in the row details.
6. Save the record.

---

## Duplicating ticket templates

When you duplicate a template, the system copies all the information from the existing template but inserts a new template ID and sets the status to draft. Duplicating a ticket template is useful when you want to create a new template that is similar to an existing template.

## Procedure

---

1. In the Ticket Templates application, display the template that you want to duplicate.
2. Select the Duplicate Template action.
3. Modify the ticket template.
4. Save the record.

---

## Service Level module

You use the Service Level module to create and manage service level agreements which document the commitments between service providers and customers. You can also create a service group for each type of service that you provide or procure.

- [Service Level Agreements](#)  
In the Service Level Agreements application, you create and manage service level agreements. Service level agreements document the commitments between service providers and customers. Services consist of tasks that service providers complete to fulfill customer needs. Commitments are responsibilities that service providers must meet to fulfill service level agreements.
- [Service Groups](#)  
You use the Service Groups application to define all services that you provide or procure. You create a service group for each type of service that you define.

---

## Service Level Agreements

In the Service Level Agreements application, you create and manage service level agreements. Service level agreements document the commitments between service providers and customers. Services consist of tasks that service providers complete to fulfill customer needs. Commitments are responsibilities that service providers must meet to fulfill service level agreements.

Service level agreements exist at the system level. However, you can restrict service level agreements to the organization or site level. If you do not specify values for organization and site, anyone can view the service level agreement and users from any site with the proper permissions can apply the service level agreement. If you specify values for organization or site field, users can only view or apply that service level agreement within the specified organization or site.

When you create a service level agreement, you can perform these functions:

- Rank service level agreements according to precedence, which determines which service level agreement to apply
- Set effective start date, end date, and review date for a service level agreement, which you can use to drive a workflow process
- Associate contracts with a service level agreement
- Associate related service level agreements with the current service level agreement
- Associate assets and locations with a service level agreement
- Create key performance indicators, or metrics, for a service level agreement
- Create escalations to support the commitments in a service level agreement

---

## Service level agreements and other applications

Users can apply valid service level agreements to records from other applications.

---

## Other application example

In a service desk environment, a user with the proper permissions can apply a service level agreement from any of the Ticket applications or Work Order applications.

---

## Service level agreements and escalations

You can use the Service Level Agreements application and escalation functionality to manage and meet the commitments in a service level agreement. An escalation is a function that automatically monitors critical processes. A service level agreement can have one or more commitments, each having their own escalation points.

---

## Escalations example

You have a service level agreement with a customer. The service level agreement has two commitments with an escalation point for each. The first commitment is to respond to all incidents that are related to the e-mail server within two hours. The escalation point for the first commitment is to notify a supervisor if no response has been given after one hour.

The second commitment is to resolve all incidents that are related to the e-mail server within four hours. The escalation point for the second commitment checks the status of the incident at the two-hour point. If the incident is still open, ownership of the incident is reassigned to the supervisor. The supervisor can take the appropriate actions to meet the service level agreement commitments.

- [Service level agreements overview](#)  
Service level agreements document the commitments between service providers and customers. You can define commitment types, associate assets and locations, rank service level agreements, set calendars, create associated key performance indicators, and define escalations.
- [Managing service level agreements](#)  
After you create a service level agreement, you can associate contracts, create escalations, change the service level agreement, change the status, and create key performance indicators.

---

## Service level agreements overview

Service level agreements document the commitments between service providers and customers. You can define commitment types, associate assets and locations, rank service level agreements, set calendars, create associated key performance indicators, and define escalations.

- [Types of service level agreements](#)  
When you create a service level agreement, you must assign a type. The type enables you to sort or search for service level agreements by type.
- [Key performance indicators associated with service level agreements](#)  
In the Service Level Agreements application, you manage key performance indicators that are associated with a service level agreement. A key performance indicator is a metric that tracks critical performance variables over time. In this case, you track the performance of a service desk organization and its compliance with service level agreements.
- [Ranking system for service level agreements](#)  
In the Service Level Agreements application, there is a ranking system that uses a ranking value to select one or more service level agreements to apply to a record. Depending on your configuration, you can either apply one or multiple service level agreements to a record. You set these options at the site level.
- [Automatic matching of service level agreements to records](#)  
Matching logic is used to automatically match service level agreements to records. The matching logic compares the completed fields in the service level agreements to the same fields in the record to which you are applying the service level agreement.
- [Calendars for service level agreements](#)  
When you create service level agreements, you can use two different types of calendars: an applies to calendar or a calculation calendar. The applies to

calendar specifies the business hours for a particular shift for an organization. The calculation calendar sets the target contact, start date, and finish date on a record.

- [Associated service level agreements](#)

In the Service Level Agreements application, you associate service level agreements that are related to one another. You can create either an associated service level agreement that is a parent or a child. Parent service level agreements are supported by a specific service level agreement. Child service level agreements support a specific service level agreement.

- [Escalations and service level agreements](#)

Escalations monitor processes to ensure that service providers meet the commitments in service level agreements. When you create an escalation for a service level agreement, the escalation is applied to the business object (such as service request or incident) that is used in the service level agreement.

- [Status of service level agreements](#)

To control how service level agreements are used, you can change the status of a service level agreement to draft, active, or inactive.

- [Changes to service level agreements](#)

As your business needs change, you use the Service Level Agreements application to change service level agreements.

- [Deletion of service level agreements](#)

In the Service Level Agreements application, you delete service level agreements that you no longer. When you delete a service level agreement, the associated escalation is deleted also.

---

## Types of service level agreements

When you create a service level agreement, you must assign a type. The type enables you to sort or search for service level agreements by type.

The following list describes the three predefined types for service level agreements:

- A customer service level agreement is an agreement between you and an external customer. For example, a facilities manager provides maintenance services for various customers.
- An internal service level agreement is an agreement between you and an internal customer (such as another organization, site, or department). For example, you are the facilities manager and provide maintenance services for the departments in your company.
- A vendor service level agreement is an agreement between you and the vendor. For example, you hired a vendor to support notebook services. If you have a contract with another vendor that supports your commitments to a customer, you can associate the contract to a vendor service level agreement.

The three types of service level agreements can support each other. For example, you have an internal service level agreement to provide hardware services to support internal departments. You also have a vendor service level agreement for notebook support.

- [Commitments for service level agreements](#)

When you create a service level agreement, you specify the commitments that you agreed to fulfill for external or internal customers. A commitment is a level of service that is agreed upon between the service provider and the customer that can be measured in a qualitative or quantitative way.

- [Assets and locations associated with service level agreements](#)

In the Service Level Agreements application, you associate specific assets, asset types, and locations to a service level agreement. After you activate a service level agreement and the associated escalation, the service level agreement is applied to any listed assets, asset types, and locations.

- [Service level agreements and other applications](#)

To ensure compliance with service level agreements, you can apply valid service level agreements to records from other applications.

---

## Commitments for service level agreements

When you create a service level agreement, you specify the commitments that you agreed to fulfill for external or internal customers. A commitment is a level of service that is agreed upon between the service provider and the customer that can be measured in a qualitative or quantitative way.

---

## Escalations and service level agreements

In the Service Level Agreements application, you can create an escalation to ensure that you comply with a service level agreement. One escalation is created per service level agreement, and you can add individual escalation points for each commitment that exists in a service level agreement. The values for the escalation points are defaulted from the values that you specified in the commitment. You can view and change the escalation point conditions on the Escalation tab.

---

## Vendor service level agreements

For vendor service level agreements, an external vendor fulfills commitments for you.

---

## Predefined commitment types

The following table describes the predefined commitment types.

Commitment Type	Applies to	Description
Contact	Ticket applications	<ul style="list-style-type: none"><li>• Set the target contact date for a ticket when a service desk agent applies a service level agreement</li><li>• A measure of time</li></ul>
Response	Ticket and Work Order applications	<ul style="list-style-type: none"><li>• Set the target start date for a ticket or work order when a service desk agent applies a service level agreement</li><li>• A measure of time</li></ul>

Commitment Type	Applies to	Description
Resolution	Ticket and Work Orders	<ul style="list-style-type: none"> <li>Set the target finish date for a ticket or work order when a service desk agent applies a service level agreement</li> <li>A measure of time</li> </ul>
Other	All objects	<ul style="list-style-type: none"> <li>Apply to any business object</li> <li>Possible synonyms for other include availability, reliability, and downtime</li> <li>No business rules are associated with this type</li> <li>A value + a unit of measure + a time period</li> </ul>

You can implement other commitment types to suit the needs of your business environment.

Except for the commitment type Other, you can add only one of each commitment type to a service level agreement. Three attributes are used to define the commitment types: value, unit of measure, and time period (in days). When you choose a type, the attributes are editable or read-only, as needed. For example, if you set the type to Response, the Value field and Unit of Measure field are editable. If you set the type to Other, the three attribute fields are editable.

## Assets and locations associated with service level agreements

In the Service Level Agreements application, you associate specific assets, asset types, and locations to a service level agreement. After you activate a service level agreement and the associated escalation, the service level agreement is applied to any listed assets, asset types, and locations.

To associate assets, the service level agreement must have a draft or inactive status. When you associate assets and locations to service level agreements, the following rules apply:

- You can only associate assets or locations to a service level agreement if the service level agreement applies to a ticket, work order, asset, or location.
- You can only associate an asset type to a service level agreement if the service level agreement applies to a ticket, work order, or asset.
- When you restrict a service level agreement to a specific organization or site, only the available assets, asset types, and locations for that organization or site are displayed.
- When you make a service level agreement and the associated escalation active, the service level agreement is applied to any listed assets, asset types, and locations.
- When you use the Apply SLA action from another application, the asset, asset type, or location values are used as part of the matching logic.

In the Service Level Agreements application, you associate assets, asset types, and locations on the Assets and Locations tab.

## Examples of service level agreements

You have a service level agreement with an outside vendor to provide service for a specific brand of servers. The agreement that you establish is specific to the servers, and each asset in the agreement is associated with the service level agreement. When a ticket is opened that lists one of these assets in the Asset field, the service level agreement for the servers is applied to the ticket.

You have a service level agreement that states that e-mail server 001 must be available 85% of the time in location B5. On the Assets and Locations tab in the Service Level Agreements application, you can associate the specific asset and location being referenced in the service level agreement.

You have a service level agreement that states that 15 servers must be available 90% of the time. Instead of adding the 15 serialized assets to the service level agreement, you can associate the asset type. When you associate the asset type, all individual assets that are classified under that type are automatically associated with the service level agreement.

## Service level agreements and other applications

To ensure compliance with service level agreements, you can apply valid service level agreements to records from other applications.

There are two ways to apply service level agreements to records:

- In a service desk environment, you can apply a service level agreement from any of the Ticket applications or Work Order applications.
- You can use the Service Level Agreements application and escalation functionality to manage the commitments in a service level agreement. An escalation is a function that automatically monitors critical processes. A service level agreement can have one or more commitments, each having their own escalation points.

## Example

You have a service level agreement with a customer. The service level agreement has two commitments with an escalation point for each. The first commitment is to respond to all incidents that are related to the e-mail server within two hours. The escalation point for the first commitment is to notify a supervisor if no response has been given after one hour.

The second commitment is to resolve all incidents that are related to the e-mail server within four hours. The escalation point for the second commitment checks the status of the incident at the two-hour point. If the incident is still open, ownership of the incident is reassigned to the supervisor. The supervisor can take the appropriate actions to meet the service level agreement commitments.

## Key performance indicators associated with service level agreements

In the Service Level Agreements application, you manage key performance indicators that are associated with a service level agreement. A key performance indicator is a metric that tracks critical performance variables over time. In this case, you track the performance of a service desk organization and its compliance with service level agreements.

Key performance indicators are created in the Key Performance Manager application. For key performance indicators, you can perform the following actions:

- Define the value to be calculated (response time, resolution time, and so on)
- Select a calculation type (percentage or decimal)
- Define the time you want calculated (day, week, month, and so on)
- Define the thresholds that define the red, yellow, and green limits on the key performance indicator display
- Define the degree to which users can drill down through the key performance indicator to get more information, such as response time by department

## Graphs for key performance indicators

---

The following list describes the color code for the graphs for key performance indicators:

- The gray arrow represents the number in the Target field.
- The orange arrow represents the number of records found for the query.
- The green area represents the target zone.
- The yellow area represents the warning zone.
- The red area represents the alert or danger zone.

In the Service Level Agreements application, you use the KPIs tab to create and associate key performance indicators with service level agreements.

To view the graphs for key performance indicators, you must use either the KPI Manager application or add the key performance indicator portlets to your start center.

## Example of key performance indicator

---

A service level agreement with a customer states that you must meet the following criteria:

- Respond to all incident tickets within one hour and resolve the incidents within three hours
- Maintain a monthly average of a one-hour response time, or pay financial penalties

To ensure that you are aware of your average response time for all incident tickets for this customer, you create a key performance indicator for this service level agreement, and make the key performance indicator accessible to the appropriate managers. Using the key performance indicator, you can take necessary proactive measures to avoid the financial penalties associated with noncompliance.

---

## Ranking system for service level agreements

In the Service Level Agreements application, there is a ranking system that uses a ranking value to select one or more service level agreements to apply to a record. Depending on your configuration, you can either apply one or multiple service level agreements to a record. You set these options at the site level.

Service level agreements are ranked in the following ways:

- If application of one service level agreement is allowed, and more than one service level agreement matches a record, the value in the Ranking field is used to select a service level agreement. The matching service level agreement with the highest ranking (the lowest number in the Ranking field) is applied.
- If application of more than one service level agreement is allowed, all matching service level agreements are applied. If more than one service level agreement is allowed, all matching service level agreements are applied. The service level agreement that calculates target dates either is the service level agreement with the highest ranking or the service level agreement with the most stringent commitment time. Your system administrator determines this setting.

---

## Automatic matching of service level agreements to records

Matching logic is used to automatically match service level agreements to records. The matching logic compares the completed fields in the service level agreements to the same fields in the record to which you are applying the service level agreement.

## Matching rules

---

The following rules apply when service level agreements are matched to records:

- Depending on system configuration, you might be able to apply one service level agreement or multiple service level agreements to a record:
  - If you can apply only one service level agreement to a record and there are multiple valid service level agreements for that record, the service level agreement with the highest rank is applied to calculate the contact, response, and resolution dates.
  - If you can apply multiple service level agreements to a record, the system administrator must choose whether to prioritize the service level agreements based on a numerical rank or commitment stringency. If prioritization is based on commitment stringency, the commitment types across all valid service level agreements are compared, and the most stringent commitment from each type is used to set the values on the ticket or work order.
- If there are multiple service level agreements with the same rank that can apply to a record, the first matching service level agreement that is found is used.

## Matching fields

---

The following fields are used to match service level agreements to records:

- Additional Criteria field
- Asset field
- Asset Type field
- Calendar field (in the applies to calendar)
- Classification field
- Location field
- Organization field
- Service field
- Service Group field
- Shift field (in the applies to calendar)
- Site field
- Vendor field

When one of the following conditions is met in these fields, a match is made:

- When the value in the field in the service level agreement matches the value in that field in the record
- There is a null value in the field in the service level agreement and a null value in that field in the record
- There is a null value in the field in the service level agreement and any value in that field in the record

## Matching with Boolean operators

---

The Boolean operators AND and OR are used to match a service level agreement to a record. The operator AND is used between all fields, with the exception of the Asset field, Location field, and Type field. These three fields are treated as one field, and the operator OR is used between these fields. A match occurs when any of the values in these three fields in a record matches the corresponding field in the service level agreement. Combinations of the three fields are not treated as a match.

## Examples of matching logic

---

The Service Group field, Service field, and Classification field are used for matching.

For the Service Group field and Service field, service level agreements and records are matched using the following logic:

- If the service level agreement has a value in the Service Group field, such as IT, and a null value in the Service field, then the record must have the same value in the Service Group field to be a match; the Service field can contain any value (such as PC or e-mail) or a null value.
- If the service level agreement has a value in the Service Group field and a value in the Service field, such as e-mail, then the record must have the same values in both fields to be a match. If only one of the values is the same, the service level agreement does not apply to this record.
- If the service level agreement has a null value in both the Service Group field and Services field, then the record can have any value in either field, including null, and be a match.

## Calendars for service level agreements

---

When you create service level agreements, you can use two different types of calendars: an applies to calendar or a calculation calendar. The applies to calendar specifies the business hours for a particular shift for an organization. The calculation calendar sets the target contact, start date, and finish date on a record.

If you leave the values for both calendars blank, time or shifts are not used as record matching criteria. When a service level agreement is applied to a record, the commitment values from the service level agreement are added to the reported date value and are used to populate the target dates on the ticket or work order.

The applies to calendar is used when service level agreements are applied to tickets and work orders.

## Applies to calendar

---

The following rules apply when you use an applies to calendar:

- You can specify the calendar and shift to use on the tickets and work orders to which the service level agreement is applied. The organization value in the applies to calendar is matched to the organization value in the ticket or work order to which the service level agreement is applied. If the two organization values are the same, the associated calendar and shift are applied.
- If you do not specify values in the applies to calendar fields, the service level agreement does not restrict business hours to a certain time or shift.
- When you use the Apply SLA action for a ticket or work order, the reported date on the record is compared to the combination of calendar and shift attributes within service level agreements. Service level agreements that can be applied to the record must meet one of the following criteria:
  - Have a reported date that occurs within the service level agreement's calendar and shift availability
  - Have an undefined calendar and shift

## Example of applies to calendar

---

For example, you have a record with a reported date of Tuesday at 8:00 PM, and the service desk hours specified in the applies to calendar table of a service level agreement are Monday through Friday, 9:00 AM to 5:00 PM. This service level agreement is not applicable to the record because the reported date does not occur within the hours specified in the applies to calendar. However, if the reported date of a record is at 4:50 PM, and you use the Apply SLA action at 5:10 PM, the service level agreement can still be applied.

## Calculation calendar

---

You use the calculation calendar to calculate the target contact date, start date, and finish date on a ticket or work order to which the service level agreement is applied. After the SQL conditions and applies to calendar values are used to match service level agreements with records, the values for organization, calendar, and shift are used to set the times on the target records. If these fields are blank, the values from the applies to calendar are used to set the target contact date, start date, and finish date.

## Examples using both calendars

---

You create a service level agreement with the values in the applies to calendar and calculation calendar set to Monday through Friday, 9:00 AM to 5:00 PM. The service level agreement response commitment is set to four hours, and the resolution commitment is set to 24 hours. When you use the Apply SLA action against a ticket with a reported date of 4:00 PM on Friday, the service level agreement is applied and the target start date is set to noon on Monday and the finish date is set to 4:00 PM on Wednesday.

You create a service level agreement with the values in the applies to calendar set to 24 hours a day, seven days a week. You set the values in the calculation calendar to Monday through Friday, 8:00 AM to 8:00 PM. The service level agreement response commitment is set to three hours, and the resolution commitment is set to 8 hours. When you use the Apply SLA action against a ticket with a reported date of 9:00 PM on Tuesday, the service level agreement is applied and the target start date is set to 11:00 AM on Wednesday and the finish date is set to 4:00 PM on Wednesday.

---

## Associated service level agreements

In the Service Level Agreements application, you associate service level agreements that are related to one another. You can create either an associated service level agreement that is a parent or a child. Parent service level agreements are supported by a specific service level agreement. Child service level agreements support a specific service level agreement.

In the Service Level Agreements application, you use the SLAs That This SLA Supports sub tab and the Related SLAs tab to create associated service level agreements.

## Parent service level agreements

---

Parent service level agreements are service level agreements that a specific service level agreement supports. For example, you can associate a selected service level agreement with other service level agreements that are needed to remain in compliance.

Parent service level agreements are service level agreements that another service level agreement supports. For example, a parent service level agreement is a specific service level agreement is needed for other service level agreements to remain in compliance.

## Child service level agreements

---

Child service level agreements are service level agreements that support a specific service level agreement. For example, child service level agreements are other service level agreement that are needed to keep a specific service level agreement in compliance.

## Associating service level agreements

---

The following rules apply to associated service level agreements:

- When you select service level agreements to associate with a specific service level agreement, the commitments of the service level agreements that you are trying to associate are validated and you are notified if there are any conflicting or less stringent commitments.
- You cannot associate the same service level agreement as both a child and a parent of another service level agreement.
- You can deactivate a service level agreement that supports another service level agreement.

## Example of service level agreement

---

You are an outside facilities service provider with a customer service level agreement with a company to resolve all elevator outages within 24 hours of being reported. To keep this commitment to the customer, you also have a vendor service level agreement with a third-party elevator vendor to resolve any issues that you report within 12 hours. In the Service Level Agreements application, you access the parent (customer) service level agreement, click the Related SLAs tab, and associate the child (vendor) service level agreement on the Supporting SLAs sub tab.

---

## Escalations and service level agreements

Escalations monitor processes to ensure that service providers meet the commitments in service level agreements. When you create an escalation for a service level agreement, the escalation is applied to the business object (such as service request or incident) that is used in the service level agreement.

Each service level agreement has a one-to-one relationship with an escalation, and each commitment in a service level agreement maps to an escalation point in the corresponding escalation.

## Escalation rules

---

The following rules apply when you create escalations in the Service Level Agreements application:

- You can create service level agreements at the site, organization, or system level. If you specify an organization or site, the service level agreement's associated escalation is restricted to that site or organization. If you do not specify an organization or site, the escalation is available to all sites and

- organizations.
- When you create a service level agreement, the status of the service level agreement is set to draft. When you create an escalation for a draft service level agreement, the associated escalation is set to inactive.
- After you set a service level agreement to active, the associated escalation is activated, if the escalation contains one escalation point and action or notification.
- If you create an escalation for an active service level agreement, you must use the Escalation „> Activate/Deactivate Escalation action to activate the escalation.

## Escalation points

An escalation comprises of escalation points that represent a monitored condition or threshold, such as measuring elapsed time. An escalation is triggered when records that meet the condition or threshold that is defined in the escalation points.

After you define commitments for a service level agreement, you can create escalation points for each commitment row. The values from the commitment row are used in the escalation point to define the conditions that trigger an escalation. You can associate each escalation point with actions and notifications. You can also specify an organization, organization calendar, and shift to determine how the escalation points are calculated.

The following are typical uses for escalation points:

- Measuring elapsed time against an attribute (time period from now to an event in the past), such as how many hours an assignment has been untouched in someone's inbox
- Measuring time until lapse (time period from now to an event in the future), such as how many days until a contract expires
- Using for a standalone condition without a time measurement, such as using to automatically accept or reject an assignment in a workflow process

## Example of escalation point

An escalation point can measure elapsed time against an attribute. If you want to measure elapsed time for a specific attribute of an object, specify a value for the elapsed time attribute to choose a date-related or time-related attribute that you want to measure. Then schedule how often or when to check the object. For example, if the service level agreement applies to incident records, specify TARGETSTART as the elapsed time attribute with an associated value of -15.00 minutes. If the condition for the escalation point is met, the associated action or notification is triggered 15 minutes before the target start time for the incident record.

## Actions and notifications

An action is an event, such as changing a status, and a notification is an e-mail. You can associate actions and notifications to an escalation point. You must associate at least one action or notification to an escalation before you can activate the escalation.

- [Actions and notifications associated with escalation points](#)  
When records meet the conditions in an escalation, an action or notification is triggered. An action is an event, such as changing status, and a notification is an e-mail message. Escalation points are the component of an escalation that represent a monitored condition or threshold, such as measuring elapsed time.
- [Escalation validation](#)  
In the Service Level Agreements application, you can validate an escalation that is associated with a service level agreement. The validation process ensures that all structured query language (SQL) statements are syntactically and semantically correct.
- [Escalation activation](#)  
You use escalations to ensure that the service provider complies with the commitments specified in a service level agreement. To trigger the conditions specified in an escalation, you activate the escalation. When you no longer want to trigger these conditions, you deactivate the escalation.
- [Communication templates and service level agreements](#)  
In the Service Level Agreements application, you use communication templates to create e-mail notifications. Communication templates provide a mechanism to communicate outbound information in a uniform manner.

## Actions and notifications associated with escalation points

When records meet the conditions in an escalation, an action or notification is triggered. An action is an event, such as changing status, and a notification is an e-mail message. Escalation points are the component of an escalation that represent a monitored condition or threshold, such as measuring elapsed time.

To activate an escalation, you must associate at least one action or notification.

## Actions

An action is an event that is triggered when records meet the conditions that are defined in an escalation point. When you associate multiple actions, you can assign a preexisting action a sequence number. Default values for the description and the action type are provided based on the record and the action that you chose. You can also use the Actions application to create an action to use with an escalation point.

Action types define categories of actions. You can use a predefined action type, such as set owner, status change, and create ticket, or you can create an action type.

When you associate actions in the Escalations application, action groups can be created automatically or you can add action groups in the Actions application. Action groups are predefined sets of actions that are grouped in a specific sequence. Escalations are associated with actions through the action group. If you associate a predefined action, an action group is created for that action, and the predefined action becomes a member of that action group. Only the action group with the escalation point is associated, not the action itself.

## Notifications

A notification is an e-mail message that you want to send when records that meet the condition defined in the escalation are found. You can create two types of notifications: free-form notifications or template-based notifications. Free-form notifications require that you define only a role or recipient, subject, and message. You can also use communication templates to add or create a predefined, template-based notification for an escalation point.

For example, if you do not respond to an assignment within two hours, the assignment is escalated to your supervisor and an e-mail notification is sent to your supervisor.

---

## Escalation validation

In the Service Level Agreements application, you can validate an escalation that is associated with a service level agreement. The validation process ensures that all structured query language (SQL) statements are syntactically and semantically correct.

When you set the status of a service level agreement to active, any SQL is validated in the following order:

1. Any SQL that is in the Additional SLA Criteria table window is validated.
2. On the Escalation tab, any SQL that is in the Condition field and Escalation Point Condition field is validated.

If both the service level agreement condition and any associated escalation conditions validate successfully, you can change the status of the service level agreement to active. Actions and notifications are not validated.

You can also select the Escalation >> Validate Escalation action to validate conditions. You correct any errors in the validation results table. If the error was found in the condition for an escalation point, the rows that contain the errors are highlighted.

---

## Escalation activation

You use escalations to ensure that the service provider complies with the commitments specified in a service level agreement. To trigger the conditions specified in an escalation, you activate the escalation. When you no longer want to trigger these conditions, you deactivate the escalation.

The following rules apply to activating and deactivating escalations:

- When you change the status of a service level agreement from draft to active, the associated escalation is activated.
- When you create an escalation for an active service level agreement, you must use the Activate/Deactivate Escalation action to activate the escalation.
- When you change the status of a service level agreement to inactive, you are prompted to deactivate the associated escalation.

To deactivate or activate an escalation, you use the Escalation >> Activate/Deactivate Escalation action.

---

## Communication templates and service level agreements

In the Service Level Agreements application, you use communication templates to create e-mail notifications. Communication templates provide a mechanism to communicate outbound information in a uniform manner.

A notification includes a template ID, the role or recipient name, the subject of the notification, and the message.

You can create the following two types of notifications:

- Free-form notification that uses a few features of a communication template
- Template-based notification that can use all the communication template features, including attached documents

If you create a free-form notification, a template ID is generated. However, this notification is not saved for reuse in the Communication Templates application.

If you create a notification with an existing template, the remaining fields are defaulted from the communication template that you chose and are read only. You cannot change the attributes associated with a communication template from the Escalations tab of this application.

If you have information that is sent out repeatedly, you can create a communication template and attach it as a notification on an escalation.

---

## Substitution variables

Free-form notifications and template-based notifications are associated with the object to which they apply. This association allows the placement of substitution variables for the object that is specified in the escalation.

If you create a template-based notification in an escalation, the Subject field and Message field could be populated with substitution variables. For example, if the Subject line reads:

Expiration Notice: Contract :contractnum

then :contractnum is replaced with the actual contract number that is obtained from the contract object associated with the template and notification.

---

## Status of service level agreements

To control how service level agreements are used, you can change the status of a service level agreement to draft, active, or inactive.

To change the status of a service level agreement, you use the Change Status action. You can change the status to one of the following three options:

- **Draft** - When you create a service level agreement, the status is set to draft. You can leave the service level agreement in draft status until it is ready for approval or use. Once you set a draft service level agreement to active or inactive, you cannot reset it to draft. When a service level agreement is in draft status, the associated escalation is set to inactive.
- **Active** - You set a service level agreement to active when you are ready for the service level agreement to be used. Other users can only apply active service level agreements to a record. When a service level agreement is active, the associated escalation also is set to active.
- **Inactive** - You set a service level agreement to inactive if you do not want users to be able to apply the service level agreement to a record.

---

## Changes to service level agreements

As your business needs change, you use the Service Level Agreements application to change service level agreements.

When a service level agreement is in draft or inactive status, you can change information that is on the Service Level Agreement tab, Assets and Locations tab, and Escalation tab. When a service level agreement is in active status, you can change information about the Related SLAs tab and KPIs tab. If you need to change the status of a service level agreement, use the Change Status action.

If you change the values in a commitment line in a service level agreement that has related service level agreements, you are warned of any conflicting or less stringent commitments. One level up and one level down from the current record are validated, and all direct parents and all direct children of the changed service level agreement are checked.

---

## Deletion of service level agreements

In the Service Level Agreements application, you delete service level agreements that you no longer. When you delete a service level agreement, the associated escalation is deleted also.

You use the Delete SLA action to delete a service level agreement.

In the following cases, you cannot delete a service level agreement:

- If the service level agreement is active.
- If the service level agreement is applied to any record. In this case, you can set the status of the service level agreement to inactive to prevent it from being used in the future.
- If the service level agreement supports another service level agreement. In this case, you can set the status of the service level agreement to inactive to prevent it from being used in the future.

---

## Managing service level agreements

After you create a service level agreement, you can associate contracts, create escalations, change the service level agreement, change the status, and create key performance indicators.

- [Creating service level agreements](#)  
You use the Service Level Agreements application to create service level agreements to document the commitments between service providers and customers. Services consist of tasks that service providers complete to fulfill customer needs. Commitments are responsibilities that service providers must meet to fulfill service level agreements.
- [Associating contracts with service level agreements](#)  
To manage your service level agreements, you can associate specific vendor service level agreements with contracts. You use one of the contracts applications to create contracts.
- [Creating escalations for service level agreements](#)  
You use escalations to monitor critical processes to ensure that service providers meet the commitments in service level agreements.

---

## Creating service level agreements

You use the Service Level Agreements application to create service level agreements to document the commitments between service providers and customers. Services consist of tasks that service providers complete to fulfill customer needs. Commitments are responsibilities that service providers must meet to fulfill service level agreements.

---

### Procedure

1. From the Service Level Agreement application, click New SLA.
2. In the SLA field, specify a value for the service level agreement.
3. Optional: Provide a description of the service level agreement.
4. In the Applies To field, specify a value for what the service level agreement applies to.  
For example, you can apply the service level agreement to an incident or service request.
5. Specify the type of service level agreement.

6. Optional: To restrict the service level agreement, specify values for organization or site.
7. Optional: Provide the following information for the service level agreement:
  - Values for ranking, administrator, vendor, customer or vendor contact, classification, service group, and service
  - Values for start date, end date, and review date
  - Additional criteria
8. To create commitments for the service level agreement, complete these steps:
  - a. In the Commitments table window, click New Row.
  - b. Optional: Specify a value for the commitment and provide a description.
  - c. Specify the type of commitment.
  - d. Specify the value for the number that sets the time or quantity that you want to measure.
  - e. Specify the unit of measure by which the commitment is measured.
9. Save your changes.

## What to do next

The service level agreement is created as a draft. You use the Change Status action to activate the service level agreement.

## Associating contracts with service level agreements

To manage your service level agreements, you can associate specific vendor service level agreements with contracts. You use one of the contracts applications to create contracts.

## About this task

After you associate a contract to a vendor service level agreement, you must first remove the contract before you can change the service level agreement to any other type.

## Procedure

1. In the Service Level Agreements application, select the service level agreement with which you want to associate contracts.
2. Select the Associate Contracts action.
3. In the Associate Contracts window, complete one the following steps to associate a contract:
  - a. To associate a new contract, click New Row and specify a value in the Contracts field.
  - b. To associate multiple contracts, click Select Contracts.
4. Click OK.

## What to do next

To remove contracts from a service level agreement, you use the Associate Contracts action.

## Creating escalations for service level agreements

You use escalations to monitor critical processes to ensure that service providers meet the commitments in service level agreements.

## Procedure

1. In the Service Level Agreements application, select the service level agreement for which you want to create an escalation.
2. In the Commitments table window, select Define Escalation for a commitment row.  
On the Escalation tab, the information in the Escalation, and Escalation Points table windows are populated from the service level agreement.
3. Optional: Change the default schedule to reflect how often you want records searched.
4. Optional: Change the condition statement that was obtained from the commitment line in the service level agreement.  
The condition identifies the set of records that you want the escalation to target.
5. Optional: In the Escalation Points section, change or delete the values for the calculation calendar if you want to use a different organization, calendar, or shift in the calculations.
6. Optional: Define an action for the service level agreement, complete these steps:
  - a. On the Actions tab, click New Row.
  - b. Specify a value for the action.  
The Description field, Sequence field, and Type field are populated based on the action that you specified.
7. Optional: To define a notification, complete these steps:
  - a. On the Notifications sub tab, click New Row.
  - b. Complete one of these steps to create a notification:

Option	Description
To create a free-form notification	Specify values for role or recipient, subject, and message

Option	Description
<b>To create a template-based notification</b>	Specify a value for the template. The Subject field and Message field are populated based on the template that you select. These fields could be populated with substitution variables. For example, a subject line reads: <i>Expiration Notice:contract:contractnum. :contractnum</i> is replaced with the actual contract number.

8. Select the Escalation > Validate Escalation action to validate the SQL conditions.
9. Optional: Expand the Validation Results table window to review and correct any validation errors.
10. Save your changes to associate the escalation to the service level agreement.

- [Creating actions for service level agreements](#)

You use actions to trigger events, such as changing status, in a service level agreement that were defined in the escalation process.

- [Creating notifications for service level agreements](#)

You use notifications to communicate about conditions in a service level agreement that were defined in the escalation process. You can create two types of notifications: free-form or template-based. Free-form notifications require that you define a role or recipient, subject, and message. Template-based notifications use a predefined communication template.

## Creating actions for service level agreements

You use actions to trigger events, such as changing status, in a service level agreement that were defined in the escalation process.

### Procedure

1. In the Service Level Agreements application, select the service level agreement for which you want to create an action.
2. In the Commitments table window, select Define Escalation for a commitment row.  
On the Escalation tab, the information in the Escalation, and Escalation Points table windows are populated from the service level agreement.
3. On the Actions sub tab, click New Row.
4. Specify a value for the action.  
The Description field, Sequence field, and Type field are populated based on the action that you specified.
5. Save your changes.

## Creating notifications for service level agreements

You use notifications to communicate about conditions in a service level agreement that were defined in the escalation process. You can create two types of notifications: free-form or template-based. Free-form notifications require that you define a role or recipient, subject, and message. Template-based notifications use a predefined communication template.

### Procedure

1. In the Service Level Agreements application, select the service level agreement for which you want to create a notification.
2. On the Escalation tab, click the Notifications sub tab.
3. Click New Row.
4. In the Template field, complete one of these steps to create a notification:
  - a. To create a free-form notification, specify values for role and recipient, subject, and message.
  - b. To create a template-based notification, specify a value for the template.  
The Subject field and Message field are populated based on the template that you select. These fields could be populated with substitution variables. For example, a subject line reads: *Expiration Notice:contract:contractnum. :contractnum* is replaced with the actual contract number.
5. Optional: Specify a value for role and recipient.
6. Save your changes.

## Service Groups

You use the Service Groups application to define all services that you provide or procure. You create a service group for each type of service that you define.

You can group tickets, work orders, and contracts by service group or by individual service. You can create service level agreements for a service group or for a service group and service combination. You can also associate a specific asset, asset type, or location with a service or service group. In the Service Groups application, you can view the relationships that exist between these records and a particular service group or service.

- [Deletion rules for services and service groups](#)

As your business needs change, you can delete services and service groups.

- [Working with services and service groups](#)

You can create service groups, create services, view relationships between services and service groups, and associate assets and locations with services and service groups.

## Deletion rules for services and service groups

As your business needs change, you can delete services and service groups.

To delete a service group, use the Delete Service Group action in the Service Groups application. To delete a service, use the Mark Row for Delete function.

You can delete a service group that is referenced by another record, such as ticket or work order, and the service reference remains on that record. Before you can delete a service group, you must delete the services in that group.

---

## Working with services and service groups

You can create service groups, create services, view relationships between services and service groups, and associate assets and locations with services and service groups.

- [Creating service groups](#)  
You use the Service Groups application to create a service group for the types of service that you define.
- [Creating services for service groups](#)  
You use the Service Groups application to create services. When you create a service, the default service type is the parent service group. The contact and contact group information is determined by the service group to the service record.
- [Associating assets with services and service groups](#)  
In the Service Groups application, you can simplify the management of services by associating assets with specific services and service groups in your organization.

---

## Creating service groups

You use the Service Groups application to create a service group for the types of service that you define.

---

### About this task

You must create a service group before you can create services.

---

### Procedure

1. In the Service Groups application, click New Service Group.
  2. Specify a service group.
  3. Optional: Specify the contact, the contact group, and the type of service.  
You can sort service groups by the type of service.
  4. Optional: Create services for the group.
  5. Save your changes.
- [Viewing records that are related to service groups](#)  
To help manage the services in your organization, you use the Service Groups application to view records that are related to a specific service. Related records can include tickets, work orders, assets, locations, asset types, service level agreements, or contracts that are associated with the service.
  - [Removing assets from service groups](#)  
As your business needs change, you can remove assets that are associated with a service.
  - [Removing asset types from service groups](#)  
As your business needs change, you can remove asset types that are associated with a service group.
  - [Removing locations from service groups](#)  
As your business needs change, you can remove locations that are associated with a service group.

---

## Viewing records that are related to service groups

To help manage the services in your organization, you use the Service Groups application to view records that are related to a specific service. Related records can include tickets, work orders, assets, locations, asset types, service level agreements, or contracts that are associated with the service.

---

### Before you begin

You associate a ticket, work order, service level agreement, or contract with a service from the respective applications.

---

### Procedure

1. In the Service Groups application, select the appropriate service group.
2. Select the View Related Records action.
3. In the View Related Records for Service Group dialog box, select one of the following options to view related records:

Option	Description
<b>View Related Records for the Service Group</b>	This is the default view, and shows only those records that are associated at the group level.
<b>View Related Records for the Service Group and Services</b>	This view shows the records that are associated at the group level and the records that are associated with a specific service in that group.

4. Click Refresh, and click the tabs to view the different types of related records.
5. Optional: To relate a ticket to the service, select the ticket on the Tickets tab, and complete one of the following options:

- a. To relate the selected ticket to a global ticket, click Relate Record to Global Issue. This option is available only if the current ticket is a global ticket. Relating tickets to a global issue establishes a RELATEDTOGLOBAL relationship between the tickets.
  - b. Click Relate Records.  
Relating records establishes a RELATED relationship between the records.
6. Optional: On the Work Orders tab, select the work order that you want to relate to the current record, and click Relate Records.  
Relating records establishes a RELATED relationship between the records.
  7. Click OK.

---

## Removing assets from service groups

As your business needs change, you can remove assets that are associated with a service.

### Procedure

---

1. In the Service Groups application, select the appropriate service group.
2. Select the Associate Assets/Locations action.
3. On the Assets and Locations tab in the Associate Assets and Locations dialog box, delete the row for the asset that you want to remove.
4. Click OK.

---

## Removing asset types from service groups

As your business needs change, you can remove asset types that are associated with a service group.

### Procedure

---

1. In the Service Groups application, select the appropriate service group.
2. Select the Associate Assets/Locations action.
3. On the Assets tab in the Associate Assets and Locations dialog box, delete the row for the asset type that you want to remove.
4. Click OK.

---

## Removing locations from service groups

As your business needs change, you can remove locations that are associated with a service group.

### Procedure

---

1. In the Service Groups application, select the appropriate service group.
2. Select the Associate Assets/Locations action.
3. On the Assets and Locations tab in the Associate Assets and Locations dialog box, delete the row for the location that you want to remove.
4. Click OK.

---

## Creating services for service groups

You use the Service Groups application to create services. When you create a service, the default service type is the parent service group. The contact and contact group information is determined by the service group to the service record.

### Before you begin

---

You must create a service group before you can create services.

### Procedure

---

1. In the Service Groups application, select the service group for which you are creating a service.
2. Click New Row.
3. Specify the service.
4. Optional: Specify the contact, the contact group, and the type.
5. Save your changes.

- [Viewing records that are related to services](#)

To help manage the services in your organization, you use the Service Groups application to view records that are related to a specific service. Related records can include tickets, work orders, assets, locations, asset types, service level agreements, or contracts that are associated with the service.

- [Removing assets from services](#)

As your business needs change, you can remove assets that are associated with a service.

- [Removing asset types from services](#)

As your business needs change, you can remove asset types that are associated with a service.

- [Removing locations from services](#)

As your business needs change, you can remove locations that are associated with a service.

---

## Viewing records that are related to services

To help manage the services in your organization, you use the Service Groups application to view records that are related to a specific service. Related records can include tickets, work orders, assets, locations, asset types, service level agreements, or contracts that are associated with the service.

---

### Before you begin

You associate a ticket, work order, service level agreement, or contract with a service from the respective applications.

---

### Procedure

1. In the Service Groups application, select the appropriate service group.
2. In the Service field for which you want to view related records, select View Related Records for Service.
3. In the View Related Records for Service Group dialog box, click the tabs to view the different types of related records.
4. Optional: To relate a ticket to the service, select the ticket on the Tickets tab, and complete one of the following options:
  - a. To relate the selected ticket to a global ticket, click Relate Record to Global Issue. This option is available only if the current ticket is a global ticket. Relating tickets to a global issue establishes a RELATEDTOGLOBAL relationship between the tickets.
  - b. Click Relate Records. Relating records establishes a RELATED relationship between the records.
5. Optional: On the Work Orders tab, select the work order that you want to relate to the current record, and click Relate Records. Relating records establishes a RELATED relationship between the records.
6. Click OK.

---

## Removing assets from services

As your business needs change, you can remove assets that are associated with a service.

---

### Procedure

1. In the Service Groups application, select the appropriate service group.
2. Select the service from which you want to remove assets.
3. Select the Associate Assets/Locations action.
4. On the Assets and Locations tab in the Associate Assets and Locations dialog box, delete the row for the asset that you want to remove.
5. Click OK.

---

## Removing asset types from services

As your business needs change, you can remove asset types that are associated with a service.

---

### Procedure

1. In the Service Groups application, select the appropriate service group.
2. Select the service from which you want to remove asset types.
3. Select the Associate Assets/Locations action.
4. On the Assets tab in the Associate Assets and Locations dialog box, delete the row for the asset type that you want to remove.
5. Click OK.

---

## Removing locations from services

As your business needs change, you can remove locations that are associated with a service.

---

### Procedure

1. In the Service Groups application, select the appropriate service group.
2. Select the service from which you want to remove locations.
3. From the Select Action menu, select Associate Assets/Locations.
4. On the Assets and Locations tab in the Associate Assets and Locations dialog box, delete the row for the location that you want to remove.

5. Click OK.

---

## Associating assets with services and service groups

In the Service Groups application, you can simplify the management of services by associating assets with specific services and service groups in your organization.

### Procedure

---

1. In the Service Groups application, select the service or service group with which you want to associate assets.
2. Select the Associate Assets/Locations action.
3. On the Assets and Locations tab in the Associate Assets and Locations dialog box, click Select Assets.
4. In the Select Assets dialog box, select the assets that you want to associate with the service or service group, and click OK.
5. Click OK.
6. Save your changes.

- [Associating asset types with services and service groups](#)

In the Service Groups application, you can simplify the management of service by associating asset types with specific services and service groups in your organization.

- [Associating locations with services and service groups](#)

In the Service Groups application, you can simplify the management of service by associating locations with specific services and service groups in your organization.

---

## Associating asset types with services and service groups

In the Service Groups application, you can simplify the management of service by associating asset types with specific services and service groups in your organization.

### Procedure

---

1. In the Service Groups application, select the service or service group with which you want to associate asset types.
2. Select the Associate Assets/Locations action.
3. On the Asset Types tab in the Associate Assets and Locations dialog box, click New Row and specify a value for the asset type.
4. Optional: Provide a description of the asset type.
5. Click OK.
6. Save your changes.

---

## Associating locations with services and service groups

In the Service Groups application, you can simplify the management of service by associating locations with specific services and service groups in your organization.

### Procedure

---

1. In the Service Groups application, select the service or service group with which you want to associate locations.
2. Select the Associate Assets/Locations action.
3. On the Assets and Locations tab in the Associate Assets and Locations dialog box, click Select Locations.
4. In the Select Locations dialog box, select the locations that you want to associate with the service or service groups, and click OK.
5. Click OK.
6. Save your changes.

---

## System Configuration module

The System Configuration module contains the Platform Configuration module and the Migration module.

You use the applications in the Platform Configuration module to perform numerous tasks, such as managing systems properties and domains. You use the applications in the Migration module to migrate configuration content from one environment to another.

- [Platform Configuration](#)

You use the applications in the Platform Configuration module (within the System Configuration module) to perform numerous tasks, such as managing system properties and domains. Also, you can use the applications for tasks done once, such as the initial configuration after an installation.

- [Migration](#)

You use the applications in the Migration module (within the System Configuration module) to migrate configuration content from one environment to another.

---

## Platform Configuration

You use the applications in the Platform Configuration module (within the System Configuration module) to perform numerous tasks, such as managing system properties and domains. Also, you can use the applications for tasks done once, such as the initial configuration after an installation.

- **[System Properties](#)**  
You use the System Properties application to manage system properties and the values of the system properties that various components use. A system property is a key-value pair that is used at a system level.
- **[Logging](#)**  
You use the Logging application to create and to manage log files that contain informational, warning, or error messages about the system.
- **[Domains](#)**  
Administrators can use the Domains application to add or modify domains to fit with your business practices. Domains are used throughout the product. They validate entered field values, provide lookup lists from which users can select field values, and can copy data sets or values to fields.
- **[Database Configuration](#)**  
You use the Database Configuration application to create or change objects and attributes, and to customize the database. An object is a self-contained software entity that consists of both data and functions to manipulate data. Most applications are associated with one main object and other related objects.
- **[Communication Templates](#)**  
You use the Communication Templates application to create and manage communication templates. These templates can be used to standardize frequently used email communications (which are also known as notifications).
- **[Actions](#)**  
In the Actions application, you manage actions and action groups that are used with escalation, service level agreement, and workflow processes.
- **[Roles](#)**  
You use the Roles application to manage role records that can be used as part of a communication template, escalation, service level agreement (SLA), or workflow process. When you use a role a process, the process is routed to the correct individual based on information associated with the role record.
- **[Escalations](#)**  
You use the Escalations application to automatically monitor critical processes in your enterprise. You can either create an escalation or customize a predefined escalation to suit your business needs.
- **[Workflow Designer](#)**  
You use the Workflow Designer application to create, to view, to modify, and to delete workflow process records that reflect your business processes.
- **[Workflow Administration](#)**  
You use the Workflow Administration application to view and to manage active instances of workflow processes.
- **[Cron Task Setup](#)**  
You use the Cron Task Setup application to create cron tasks and cron task instances, and to remove cron tasks or cron task instances. You can also change cron task parameters and statuses, and adjust the schedule of a cron task.
- **[E-mail Listeners](#)**  
In the E-mail Listeners application, you can receive and process service request and other types of tickets using e-mail messages. You can create or update tickets. You can also indicate whether the status is changed or queried based on specified criteria.
- **[Database Information](#)**  
The Database Information application provides information and access for database objects and attributes. You can make limited changes to data structures, such as associating a domain with an attribute, making an attribute required, or changing the search type.
- **[Web Services Library](#)**  
You can use the Web Services Library application to create and deploy web services for all service types, object structure, enterprise, and standard services. By deploying web services, external applications can make SOAP-based calls to retrieve or update business object data. The application generates the XML schema and Web Services Description Language (WSDL) files for all of your web services.
- **[Launch in Context](#)**  
You use the Launch in Context application to create and modify launch entry records which open an external application in the same or a different browser session. You can open applications independently or as part of an application integration scenario.
- **[Automation Scripts](#)**  
With the Automation Scripts application, you can create scripts to automate tasks that are based on the events or attributes of a business object, or based on actions or custom conditions. You can create a script in any of several supported scripting languages, and run the script without having to recompile Java™ files or restart the server.

---

## System Properties

You use the System Properties application to manage system properties and the values of the system properties that various components use. A system property is a key-value pair that is used at a system level.

The System Properties application lists all the system properties with their descriptions.

---

## Example

The key mail.smtp.host represents a system property that is used to set up email. The value for the property is SMTP mail server.

---

## Logging

You use the Logging application to create and to manage log files that contain informational, warning, or error messages about the system.

- **[Troubleshooting Maximo Manage](#)**  
Maximo® Manage provides tools that you can use to help you troubleshoot and resolve issues with the application.

---

# Troubleshooting Maximo Manage

Maximo® Manage provides tools that you can use to help you troubleshoot and resolve issues with the application.

- [Manage Monitoring Information](#)  
The Manage Monitoring Information (MMI) application provides information about the current state of a Manage deployment. You can use this information for troubleshooting purposes.
- [JDOM upgrade](#)  
JDOM upgrade in Maximo Manage 8.5 is recommended.
- [Debugging Maximo Manage with Eclipse](#)  
Debug Maximo Manage by using the Eclipse debugger.
- [Enabling debugging for Maximo Manage](#)  
It is possible to remotely debug Maximo Manage by connecting to the Liberty server.

---

## Manage Monitoring Information

The Manage Monitoring Information (MMI) application provides information about the current state of a Manage deployment. You can use this information for troubleshooting purposes.

The application displays the following information about the server bundle pods that are deployed:

### System information

- Database information
- Maximo® business object (MBO) count
- Memory
- Java™ (JVM) information
- Threads
- Operating System information

### Integration information

- Queues
- OS cache
- Global directory
- Event topic tree

### Other information

- User information
- Class information
- Cron tasks
- Appservices

The monitoring information is provided by a set of REST APIs.

MMI uses JavaScript Object Notation (JSON) as the data format for representing the collected state information. All MMI requests are HTTP GET requests, and MMI request handlers are not intended to modify the state of the system.

- [Manage Monitoring Information APIs](#)  
Manage Monitoring Information (MMI) APIs provide information that is related to the state of a Maximo Manage deployment.
- [Scenario: Running MMI APIs to gather diagnostic information](#)  
XYZ Corporation experiences an issue in the Maximo Manage environment and the system administrator opens a Problem Management Report (PMR) with IBM® Technical Support. IBM Technical Support and Development determine that there is a need to gather diagnostic information for particular resources from the customer's environment.

---

## Manage Monitoring Information APIs

Manage Monitoring Information (MMI) APIs provide information that is related to the state of a Maximo® Manage deployment.

A list of available MMI APIs is in the Monitor Environment Information dialog of the Logging application.

Before you can collect information from the Maximo Manage environment by using the APIs, you must specify the URL path for the API in the `mxe.oslc.webappurl` system property. You can choose one of the following options for the path:

- `<Maximo Manage URL>/maximo/api/members/<memberid>/<api>`  
For example:

`https://my_instance.manage.7203.apps.my_company.com/maximo/api/members/<memberid>/mbocount`

Use this option when you have an API key.

- `https://<host>:<port>/maximo/oslc/members/<memberid>/<api>`  
For example:

`https://<host>:<port>/maximo/oslc/members/<memberid>/mbocount`

Use this option when you already have an open, authenticated session.

In the preceding examples, specify the Maximo Manage server bundle for the <memberid>.

All MMI APIs can be protected by using signature options. The signature options must be associated with the Logging application. To specify a signature option for an API, open the Monitor Environment Information dialog in the Logging application, locate the API, and select a value in the Signature Option field.

Table 1. Manage Monitoring Information APIs

API	Description	URL path <b>Note: You can also use the OSLC URL if you have an authenticated session.</b>
apimetrics	API Metrics handler	/maximo/api/members/<memberid>/apimetrics
appservices	AppService information	/maximo/api/members/<memberid>/appservices
args	JVM arguments information	/maximo/api/members/<memberid>/args
browseMessages	Browse JMS messages	/maximo/api/members/<memberid>/browseMessages
childdirs	Child directory information	/maximo/api/members/<memberid>/childdirs
classinfo	Java™™ class information	/maximo/api/members/<memberid>/classinfo
clouddbstatistics	Cloud Database Storage	/maximo/api/members/<memberid>/clouddbstatistics
clouddbstorage	Cloud Database Storage	/maximo/api/members/<memberid>/clouddbstorage
cron	Cron task information	/maximo/api/members/<memberid>/cron
cronthread	Concurrent cron task thread count and peak thread count Counts the total cron threads running at this instant in the current server process. It also provides the peak count of cron threads on that server	/maximo/api/members/<memberid>/cronthread
dbconn	Database connection creation trace	/maximo/api/members/<memberid>/dbconn
dbinfo	Database information Provides information about the database that is used by the application, including information about the database version, vendor information, and driver information.  Also provides links to the database connection pool details.	/maximo/api/members/<memberid>/dbinfo
dbmanager	Database connection pool information	/maximo/api/members/<memberid>/dbmanager
errcountmetrics	Error count metrics handler Provides the total count of <b>MXApplicationException</b> and <b>MXSystemException</b> exceptions that are created.	/maximo/api/members/<memberid>/errcountmetrics
eventtree	EventTopicTree information Provides information about the event subscription tree. The resource describes information about event topics, such as add asset or update work order, and the listeners that are associated with those topics.	/maximo/api/members/<memberid>/eventtree
formula	Formula information	/maximo/api/members/<memberid>/formula
globaldir	Integration global directory information	/maximo/api/members/<memberid>/globaldir
heapdump	Generate heapdump (currently for the IBM® JDK only)	/maximo/api/members/<memberid>/heapdump
http	Ping an HTTP or HTTPS URL	/maximo/api/members/<memberid>/http
interfaces	Java class interface information	/maximo/api/members/<memberid>/interfaces
iotservices	IoT services	/maximo/api/members/<memberid>/iotservices
jaxp	Java API for XML Processing (JAXP) provider information Provides information about the JAXP providers on the server.	/maximo/api/members/<memberid>/jaxp
jvm	Java virtual machine (JVM) information Provides information about the JVM that is hosting the application, including information about the start time, the JVM vendor, and the JVM version.  You can also drill down, by using links, to provide information about the JVM system properties and the JVM arguments.	/maximo/api/members/<memberid>/jvm
ldapsearch	LDAP search	/maximo/api/members/<memberid>/ldapsearch
loggers	Application logger state information Provides information about the state of a logger. The logger name can be provided to the API by using the oslc.where query parameter. An example of a parameter is oslc.where=oslc:shortId="maximo.script".  Provides information about the automation script logger. API consumers specify the logger name by using the oslc:shortId property for this API to provide information about the logger, which includes the log level, and active state.	/maximo/api/members/<memberid>/loggers

API	Description	URL path Note: You can also use the OSLC URL if you have an authenticated session.
mbocount	MBO count information Provides MBO count information. Also provides links to the MBO and the MboSet class. This class can be useful when you are trying to resolve out of memory (OOM) or performance issues.	/maximo/api/members/<memberid>/mbocount
memory	JVM memory information Provides information about the server heap and nonheap memory usage. All units are in Megabytes (MB).	/maximo/api/members/<memberid>/memory
mifwebservices	Web service information	/maximo/api/members/<memberid>/mifwebservices
msgproviders	Validate message provider connectivity	/maximo/api/members/<memberid>/msgproviders
objexchanged	Object Exchanged Count Provides the number of integration and UI objects that are exchanged per minute on each server.	/maximo/api/members/<memberid>/objexchanged
opsystem	Operating system information Provides information about the operating system that is used for the run time, including information about the OS type, version, architecture, and the number processors that are available.	/maximo/api/members/<memberid>/opsystem
oscache	Object structure cache Provides information about the object structure cache. It identifies cases where invalid entries in the Object Structure tables might cause cache corruption.	/maximo/api/members/<memberid>/oscache
oslcstablecache	OSLC stable cache information	/maximo/api/members/<memberid>/oslcstablecache
pingcos	Ping Cloud Object Storage (Cloud Object Storage) Provides the response time for connecting to Cloud Object Storage and the status for Cloud Object Storage connectivity.	/maximo/api/members/<memberid>/pingcos
pingdb	Ping DB Checks the database connection and calculates the average response time that is required to run 10 recent queries. These queries are obtained from the system tables. The queries are run on Oracle and Db2® databases.	/maximo/api/members/<memberid>/pingdb
pingkafka	Kafka ping handler Provides the response time for connecting to Kafka and the status for Kafka connectivity.	/maximo/api/members/<memberid>/pingkafka
queues	Integration queues information Provides information about state of an integration queue. The resource allows consumers of the API to test the connectivity/read/write to the queue and to browse messages in the queue spi:browseMessage property.  By default the API shows only the first five messages in the queue. You can control that number by using the query string oslc.where=spi:count=10. This query shows the first 10 messages in the queue.  Note: Browsing messages is a costly call and browsing too many messages simultaneously can cause memory or performance issues in the server.	/maximo/api/members/<memberid>/queues
report	Collects report metrics Provides the following report metrics: <ul style="list-style-type: none"> <li>Total number of reports that ran in the preceding hour</li> <li>Total accumulated time in seconds that reports are run in a particular day</li> <li>Information about the concurrent report usage and daily runtime of reports</li> </ul>	/maximo/api/members/<memberid>/report
resources	Resources in OSLC stable cache	/maximo/api/members/<memberid>/resources
servletstats	Collects servlet statistics Provides request and response information about the OSLCServlet, RESTServlet, and UIServlet for each application that is deployed. The response time is measured in milliseconds.	/maximo/api/members/<memberid>/servletstats
sessionstatsinfo	Session stats information for IBM WebSphere® Application Server Liberty Provides information on total sessions, active sessions, and live sessions.	/maximo/api/members/<memberid>/sessionstatsinfo
sysprops	Java virtual machine (JVM) system properties information	/maximo/api/members/<memberid>/sysprops
tablesize	Collect the five database tables with the largest size Provides information about the five database tables that have the largest table size per day. The table size is measured in MB per day.	/maximo/api/members/<memberid>/tablesize
testProviderConnection	Test connection to JMS provider	/maximo/api/members/<memberid>/testProviderConnection
testReadMessage	Test read JMS message	/maximo/api/members/<memberid>/testReadMessage
testWriteMessage	Test write JMS message	/maximo/api/members/<memberid>/testWriteMessage
threaddump	Thread dump	/maximo/api/members/<memberid>/threaddump
threadpoolinfo	Thread pool information for the IBM WebSphere Application Server Liberty profile Counts total thread pool size and total active thread pool count.	/maximo/api/members/<memberid>/threadpoolinfo

API	Description	URL path Note: You can also use the OSLC URL if you have an authenticated session.
threads	JVM thread information Provides information about the threads in the JVM, such as the current thread count, peak thread count, and whether there are any deadlocks. Also provides a link to enumerate the threads in the system at that instant. The API consumer can check for thread states and lock information about each thread.  Provides runtime thread count information that includes concurrent thread count and deadlocked thread counts.	/maximo/api/members/<memberid>/threads

## Scenario: Running MMI APIs to gather diagnostic information

XYZ Corporation experiences an issue in the Maximo® Manage environment and the system administrator opens a Problem Management Report (PMR) with IBM® Technical Support. IBM Technical Support and Development determine that there is a need to gather diagnostic information for particular resources from the customer's environment.

IBM Technical Support and Development review the available resources in the Monitor Environment Information dialog of the Logging application and determine that the system administrator should run a particular MMI API. In some cases, if an API that is needed to collect the information is not readily available, IBM development might provide a script that can collect the needed information.

IBM instructs the system administrator to run the API in a web browser by entering a URL similar to `http://<host>:<port>/maximo/api/members/<memberid>/<api>`. The system administrator submits the resulting diagnostic output with the PMR for analysis by IBM.

## API output

When the system administrator runs the MMI API by entering the required URL in the browser, the output is displayed directly in the browser.

The output is not formatted or easily readable unless the browser has a JSON viewer add-on or extension installed. JSON viewers are available for the Mozilla Firefox and Google Chrome browsers.

The system administrator saves the output in the browser to a text file and submits the file with the PMR for analysis by IBM.

## Writing scripts

If a system administrator who meets several prerequisite skills chooses to write a script without the help of IBM Technical Support and Development, the following sample script can be used as a template.

Attention: Do not write scripts unless you meet the prerequisite skills or are instructed to do so by IBM.

## Prerequisite skills

To write scripts for resources that are outside the scope of the provided scripts, the following skills are required.

- System administrator level
- Experience with calling the REST API
- Programming and script language skills

## Sample script

A system administrator wants to determine how many listeners are associated with each object event type. The system administrator wants to analyze the listener data to investigate a possible performance issue that might be related to listeners on particular assets. This goal requires a way to access the event topic tree in the Maximo Manage server and search for the specified topic, Object event type, and then find out the number of associated listeners. The following Jython script addresses this requirement.

```
from psdi.server import MXServer
if request.getWhere() is not None and request.getWhere().get("topic") is not None:
 eventTopicToFind = request.getWhere().get("spi:topic") [0]

 eventTopic = MXServer.getMXServer().getEventTopicTree().findEventTopic(eventTopicToFind)

 listenerCount = eventTopic.getListenerCount()
 br.setProperty("listenerCount", listenerCount)
```

The MMI framework includes several variables in the script.

- request - The MMI API request object. The script uses the request object to determine the object event type that the user is interested in.
- br - The response that the API returns to the user.

The script uses the request object to determine the object event type by using the Where parameter in `eventTopicToFind = request.getWhere().get("topic") [0]`.

The br parameter has a simple `setProperty(string,any)` interface that is used by the script to gather the information it will send back to the user. The script uses the `br.setProperty` API to set the listenerCount integer to the br object. This object is used to format the response to the API consumer.

The script can be added to the MMI by opening the Monitor Environment Information dialog in the Logging application, selecting New Row, and specifying the script name in the Class or Script Name field. The script must be specified in the qualified notation, `script:<script name>`, for example, `script:LISTENERS`.

The script is run by using the URL syntax `http://<host>:<port>/maximo/api/members/<memberid>/<event topic context>?oslc.where=spi:topic="maximo.asset.add"`.

Example URL: `http://127.0.0.1/maximo/api/members/OS4zM4yMS4xMzcVTVhTZXJ2ZXI-/eventtopic?oslc.where=topic="maximo.asset.add"`

---

## JDOM upgrade

JDOM upgrade in Maximo® Manage 8.5 is recommended.

### Problem

In Maximo Manage 8.5, JDOM was susceptible to a service denial. This JDOM vulnerability does not apply to Maximo Application Suite but affects Maximo Manage. In Maximo Manage 8.5, by sending a specially-crafted HTTP request, a remote attacker could use the JDOM vulnerability to block the service. The service denial is caused by an XXE issue in SAXBuilder. Affected platforms are JDOM JDOM 2.0.5 and JDOM JDOM 2.0.6.

### Solution

The issue has been addressed in Maximo Manage 8.5.

Note: The JDOM upgrade may cause compatibility issues with your existing code. It is recommended to recompile your code with the new JDOM provided with Maximo Manage 8.5 to resolve any compilation issues.  
For more information, see [National Vulnerability Database](#).

---

## Debugging Maximo Manage with Eclipse

Debug Maximo® Manage by using the Eclipse debugger.

### Prerequisites

The local machine where you install Eclipse must have the following tools:

- Red Hat® OpenShift® Container Platform command-line interface. For more information, see [Getting started with the CLI](#).
- Kubernetes command line tool. For more information, see [Install Tools](#).

---

## Creating a stand-alone server deployment

1. In the Red Hat OpenShift Container Platform console, go to Workloads>Deployments and locate the existing all or ui deployment.
2. View the YAML, then copy the spec.template.spec section.  
Note: You might find it easier to download the YAML first.
3. Select Create Deployment and assign a unique name. For example, manageddebug. Update the following:
  - a. Replace the spec.template.spec section with the copied spec.
  - b. Set the replicas to 1.
  - c. Add metadata:name as manageddebug. Make sure make sure spec.selector:matchLabels:app is set to manageddebug.

```
kind: Deployment
apiVersion: apps/v1
metadata:
 name: manageddebug
 namespace: mas-debug-manage
spec:
 replicas: 1
 selector:
 matchLabels:
 app: manageddebug
```

4. Locate the ports section and add port 7777.

```
ports:
- containerPort: 9080
 protocol: TCP
- containerPort: 9443
 protocol: TCP
- containerPort: 7777
 protocol: TCP
```

5. Update cmd args for the Maximo Manage server. Replace `/tmp/startwlp.sh;` with `/tmp/genJDBCTruststore.sh;`  
`/opt/ibm/wlp/bin/server debug defaultServer;`

```
image: >-
 image-registry.openshift-image-registry.svc:5000/mas-sb1-manage/sb1-masdev-
 all@sha256:6e6891b03d9237e64b6a3c4c41fd8dc331da74cf4cb2393a3ba70588599c600f
args:
- >-
 echo generateKeyStore...; openssl pkcs12 -export -in
 /etc/ssl/certs/internal-manage-tls/tls.crt -inkey
```

```
/etc/ssl/certs/internal-manage-tls/tls.key -out ${java_keystore}
-password pass:${java_keystore_password};
/tmp/genJDBCTruststore.sh; /opt/ibm/wlp/bin/server debug
```

Save the deployment and wait a moment for the pod to be created. Note down the pod name.

Note: The WebSphere® Application Server Liberty waits for the debugger to attach before it starts. Currently, the Logs tab displays the following:

```
generateKeyStore...
```

```
Listening for transport dt_socket at address: 7777
```

## Configuring port forwarding

1. From the Red Hat OpenShift Container Platform console, copy the login command.
2. On the local Eclipse machine, open a PowerShell for Windows command and paste the copied login command.
3. If it is necessary, use the **oc project** command to switch to the appropriate project.
4. Locate the name of the manageddebug pod.
5. Enter **kubect port-forward <podname> 7777:7777**.
6. Wait for the forwarding messages:

```
kubect port-forward manageddebug-57d79d4dfc-q82vn 7777:7777
```

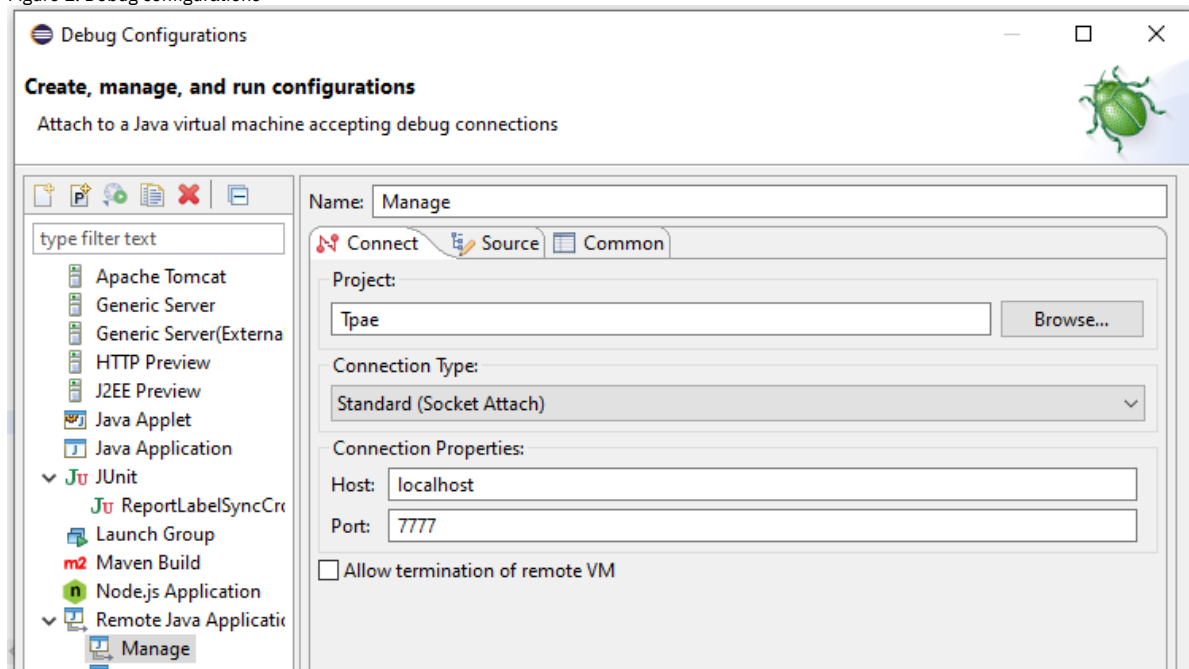

```
Forwarding from `127.0.0.1:7777 -> 7777`
```

```
Forwarding from `[::1]:7777 -> 7777`
```

## Creating the remote debug configuration

1. From the Eclipse debug view, create a Java Remote Application.
2. Attach an appropriate source code project, and attach the Java Remote Application to port 7777.
3. Set the Host field in the debug configuration to localhost.

Figure 1. Debug configurations

## Connecting the remote debugger to the listener

Launch the debug configuration. Once the debugger connects, the console displays, "Handling connection..."

```
Forwarding from `127.0.0.1:7777 -> 7777`
```

```
Forwarding from `[::1]:7777 -> 7777`
```

```
Handling connection for 7777
```

You can watch the server start progress in the pod's Logs tab.

## Defining remote access to the debug server

1. In Networking > Services, create a new service for the deployment.
2. Follow the port mapping from the existing server bundles.
3. Set spec.selector to 'app: manageddebug'.

```
selector:
 app: manageddebug
```

4. After the service is created, select the Pods tab to confirm that the labels are correctly defined and the service is applied to the debug pod.
5. In Networking > Routes, create a route for the new service, by following the existing all or ui route.
6. Use the new route location to go to the Maximo Manage application.
7. Add /maximo to the route to access the debug server.

---

## Enabling debugging for Maximo Manage

It is possible to remotely debug Maximo® Manage by connecting to the Liberty server.

### Configuring debug mode

---

1. When you deploy Maximo Manage, in the Maximo Application Suite user interface, set the debugMode to "up" and save the configuration.

Figure 1. Set debug Mode in Maximo Application Suite user interface

Or, you can set up the serverbundle property in your instance from the ManageWorkspace CustomResourceDefinitions (CRD).

Figure 2. Set debugMode in CRD

2. Go to Workloads > Deployments and make sure to scale down the ibm-mas-manage-operator deployment and entitymgr-ws deployment to '0'.
3. Go to Deployments > serverbundle and edit the YAML file to add port 7777 in the serverbundle container.

Figure 3. Set port

4. Go to Networking > NetworkPolicies and adjust the serverbundle network policy to allow port 7777.

Figure 4. Adjust network policy

- Update the cmd args for the Maximo Manage server by replacing `/tmp/startwlp.sh;` with `/tmp/genJDBCTruststore.sh;`  
`/opt/ibm/wlp/bin/server debug defaultServer;`

```
image: >-
 image-registry.openshift-image-registry.svc:5000/mas-devlatest-manage/devlatest-masdev-
all@sha256:362ce629e6abaa52750e5d5499e07c3626d75810d033b14d7bcea42fcae16998
 args:
 - >-
 echo copy additional jvm options is exists; cp
 /opt/ibm/wlp/usr/servers/defaultServer/manage/jvmoptions/jvm.options
 /opt/ibm/wlp/usr/servers/defaultServer/configDropins/overrides/.;
 echo generateKeyStore...; openssl pkcs12 -export -in
 /etc/ssl/certs/internal-manage-tls/tls.crt -inkey
 /etc/ssl/certs/internal-manage-tls/tls.key -out ${java_keystore}
 -password pass:${java_keystore_password};
 /tmp/genJDBCTruststore.sh; /opt/ibm/wlp/bin/server debug
 defaultServer;
```

- Save the deployment and wait for the pod to be created. Note down the pod name.
- Wait for the debugger to attach before it starts.
- Check that the Logs tab displays the following lines:

Figure 5. Logs tab

## Configuring port forwarding

- From the Red Hat® OpenShift® Container Platform console, copy the login command.
- On the local Eclipse system, open a PowerShell for Windows command and paste the copied login command.
- If it is necessary, use the **oc project** command to switch to the appropriate project.
- Locate the name of the newly created all or ui serverbundle pod. For example, **devlatest-masdev-all-7bd96d9cb-hb6cm**.
- Run the command **kubect port-forward <podname> 7777:7777**.
- Wait for the forwarding messages:

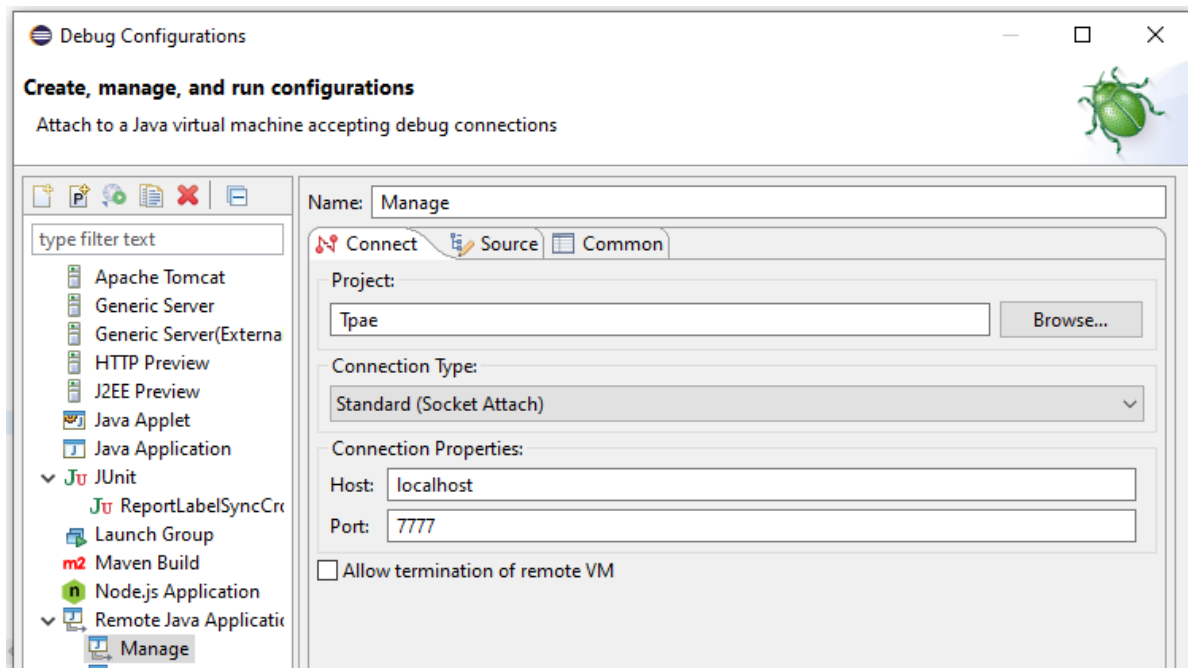

```
kubect port-forward devlatest-masdev-all-7bd96d9cb-hb6cm 7777:7777

Forwarding from `127.0.0.1:7777 -> 7777`
Forwarding from `[::1]:7777 -> 7777`
```

## Creating the remote debug configuration

- From the Eclipse debug view, create a Java™ Remote Application.
- Attach an appropriate source code project, and attach the Java Remote Application to port 7777.
- Set the Host field in the debug configuration to localhost.

Figure 6. Debug configurations

## Connecting the remote debugger to the listener

Launch the debug configuration. Once the debugger connects, the console displays, "Handling connection...".

```
Forwarding from 127.0.0.1:7777 -> 7777
Forwarding from [::1]:7777 -> 7777
Handling connection for 7777
```

You can watch the server start progress in the pod's Logs tab.

## Checking pods and accessing debug server

1. In Networking > Services, check the existing service for all or ui serverbundle pod. Select the Pods tab to confirm that the labels are correctly defined, the service is applied to the debug pod, and the pod is visible in the Pods tab.
2. In Networking > Routes, click the existing all or ui route to go to the Maximo Manage application and add /maximo to the route to access the debug server.

## Domains

Administrators can use the Domains application to add or modify domains to fit with your business practices. Domains are used throughout the product. They validate entered field values, provide lookup lists from which users can select field values, and can copy data sets or values to fields.

In the Domains application, you can add or modify domains. Modify domains by adding more values.

Adding a domain in the Domains application is only part of the process of adding a working domain to the system. After you add domains, more tasks might be required, depending on the domain and how you want the system to display it. You can use the Classifications application, the Database Configuration application, and the Application Designer application to complete these tasks.

ALN domains can be specified on classification attributes in the Classifications application. Further configuration in the Database Configuration application is not required.

## Database Configuration

You use the Database Configuration application to create or change objects and attributes, and to customize the database. An object is a self-contained software entity that consists of both data and functions to manipulate data. Most applications are associated with one main object and other related objects.

When you use the Database Configuration application, you interact at the business object level. Internally, the application determines the actions to take on the database tables to support the needs of business objects.

A database table can store several objects, each object having different business rules. For example, the TICKET table defines Incident, Problem, and Ticket business objects, which are defined as database views. In addition, a business object (view) can span more than one database table. Views represent objects that can span multiple tables.

With the business object layer, the system tables that must not be modified are not editable on the user interface but you, an administrator, can view them.

When changing the database, for example, when creating or deleting objects, attributes, or indexes, changes are stored in secondary tables. The changes do not take effect until you configure the database. It is important to back up your data before configuring the database.

- [Database configuration formulas](#)  
Database configuration formulas are used to automatically calculate the value of Maximo® Business Objects or Maximo Business Object attributes. Formulas use input variables and mathematical expressions to calculate values.
- [Operators and functions in database configuration formulas](#)  
Database configuration formulas can use most mathematical operators and commonly used functions to automatically calculate attribute values.

## Database configuration formulas

Database configuration formulas are used to automatically calculate the value of Maximo® Business Objects or Maximo Business Object attributes. Formulas use input variables and mathematical expressions to calculate values.

### Attribute formulas

Attribute formulas can be applied to both persistent and nonpersistent attributes. For example, you can create a nonpersistent asset attribute called *overbudgetcost* to track the amount that the year-to-date cost of an asset surpasses the budgeted cost. You can then add the following attribute formula to automatically calculate the value of the *overbudgetcost* attribute: `ytdcost-budgetcost`. In this example, whenever the year-to-date cost or the budget cost changes, the value for the *overbudgetcost* attribute is updated. If *overbudgetcost* is a persistent attribute, the formula calculates the value at the save point of the asset.

### Object formulas

Object formulas are associated directly to a Maximo Business Object and their values can be used as an input for other formulas. With object formulas, you do not have to create an attribute just to store a calculation. For example, you can define *overbudgetcost* as an object formula and then use that value in other formulas with the following expression: `exp$overbudgetcost`.

For more information on commonly-used formulas, see the [formula documentation on IBM® Community](#).

## Operators and functions in database configuration formulas

Database configuration formulas can use most mathematical operators and commonly used functions to automatically calculate attribute values.

The following operators can be used in database configuration formulas:

Table 1. Operators that can be used in database configuration formulas

Operator	Description	Example
+	Addition	<code>purchaseprice+tax</code>
-	Subtraction	<code>enddate-startdate</code>
*	Multiplication	<code>unitcost*quantity</code>
/	Division	<code>totalcost/quantity</code>
%	Remainder	<code>a%b</code>
^	Power <sup>®</sup>	<code>a^2</code>
&&	Logical and	<code>IF (a&gt;10 &amp;&amp; b&lt;20, x,y)</code>
	Logical or	<code>IF (a&gt;10    b&lt;20, x,y)</code>
>, >=	Greater than, greater than or equal to	<code>IF (a&gt;=10 &amp;&amp; b&lt;20, x,y)</code>
<, <=	Less than, less than or equal to	<code>IF (a&gt;=10    b&lt;20, x,y)</code>
=, ==	Equals comparison	<code>IF (a=10    b==c,x,y)</code>
!=, <>	Not equals	<code>IF (a&lt;&gt; 10 &amp;&amp; b!=c,x,y)</code>

The following functions can be used in database configuration formulas:

Table 2. Functions that can be used in database configuration formulas

Function	Number of parameters	Description	Example
IF	3	Used for if/then conditions.	<code>IF (a&gt;10    b&lt;20, x,y)</code>
MAX, MIN	2	Calculates the minimum and maximum values between two numbers.	<code>MAX(a,b)</code> or <code>MAX(a, MAX(b,c))</code>
ABS	1	Calculates the absolute value of a number.	<code>ABS (a)</code>
DATE	3	Indicates a date in the following format: yyyy, mm, dd.	<code>DATE (2015, 10, 21)</code>
DATETIME	6	Indicates a date and time in the following format: yyyy, mm, dd, hr, min, sec. DATETIME uses a 24-hour clock.	<code>DATETIME (2015, 10, 21, 14, 0, 0)</code>
DURATION	6	Indicates the duration of a time in the following format: yyyy, mm, dd, hr, min, sec.	<code>DURATION (0, 0, 3, 2, 0, 0)</code>
ROUND	2	Rounds a value to a specified decimal value.	<code>ROUND (linecost, 2)</code>

Function	Number of parameters	Description	Example
NVL	2	Returns the alternate value if one value is null.	NVL (a,b)
PCT	2	Calculates the percentage of the first parameter based on the second parameter.	PCT (Val, total)
FLOOR, CEILING	1	Calculates the largest or smallest whole number value.	FLOOR (3.2)
SQRT, SIN, LOG, LOG10. TAN, COS, ASIN, ACOS, ATAN, SINH, COSH, TANH, RAD, DEG	1	Calculate basic math functions.	SQRT (4)

## Communication Templates

You use the Communication Templates application to create and manage communication templates. These templates can be used to standardize frequently used email communications (which are also known as notifications).

You can use communication templates in the following ways:

- You can add file attachments or document folders to communication templates. When an email communication is sent, the attachments are included in the email communication, either in a folder or in an attachment.
- You can use communication templates with the workflow process. For example, you might have a workflow process for purchase requisitions that uses a communication template. When a user submits a request for a notebook, the purchase request enters the workflow and must be approved by an immediate supervisor. When the purchase request is approved, the status is set to approved. An email communication is then sent out using the communication template to the user who submitted the request.
- You can use communication templates with the escalation process. For example, when a service desk agent does not complete assignments within six hours, you can create an escalation configuration that uses communication templates. The assignment is escalated to the supervisor, and the supervisor receives an email communication.
- Service desk agents can create and send email communications from the ticket applications (the Service Requests application, the Incidents application, and the Problems application). These email communications are sent by using standardized information from communication templates. The recipients of the email communications can respond. The service desk agents can view the two-way dialog in the communication log in the ticket applications.

## Actions

In the Actions application, you manage actions and action groups that are used with escalation, service level agreement, and workflow processes.

You can create actions to perform the following tasks:

- Initiate an application action
- Execute a custom class or specified executable program
- Set the value of a field on a record
- [Actions overview](#)  
An action is a task that is performed whenever it is invoked by a user interface event, workflow process, or an escalation point.
- [Working with actions](#)  
You can create different types of actions that can be used in escalations, service level agreements, or workflow processes.

## Actions overview

An action is a task that is performed whenever it is invoked by a user interface event, workflow process, or an escalation point.

- [Types of actions](#)  
In the Actions application, you can create different types of actions. The action type determines the type of action that is activated when the action is encountered in a process, such as an escalation point, service level agreement, or workflow process.
- [Deletion rules for actions](#)  
You can delete an action record if it is no longer needed and if it is not being used by specific records or elements.

## Types of actions

In the Actions application, you can create different types of actions. The action type determines the type of action that is activated when the action is encountered in a process, such as an escalation point, service level agreement, or workflow process.

When you click New Action, you can create the following types of actions:

Type of Action	Description
----------------	-------------

Type of Action	Description
Application action	<p>You use an application action to specify that an application action is activated.</p> <p>When you create an application action, you can specify one of the following actions, if it is available for the specified object:</p> <ul style="list-style-type: none"> <li>• Use APPLYSLA to apply the specified service level agreement.</li> <li>• Use CREATECHANGE to create a change work order.</li> <li>• Use CREATEINCIDENT to create an incident ticket.</li> <li>• Use CREATEPROBLEM to create a problem ticket.</li> <li>• Use CREATERELEASE to create a release work order.</li> <li>• Use CREATESR to create a service request ticket.</li> <li>• Use CREATEWO to create a work order.</li> <li>• Use REVERSEINVOICE to create a reverse invoice from a workflow process or from an escalation. You can specify a status for the reverse invoice of either APPR (Approved) or PENDREV (Pending Reversal).</li> <li>• Use WFACCEPT to create a workflow auto-accept that accepts the record, and routes it to the positive path in the workflow process.</li> <li>• Use WFREJECT to create a workflow auto-reject that rejects the record, and routes it to the negative path in the workflow process.</li> <li>• Use WFEscalate to escalate the record in the workflow process, and change the assignment to its escalation role.</li> <li>• Use WFINITIALTE to initiate a workflow process.</li> </ul>
Change status action	You use a change status action to specify that the status of the record is changed. You define the outcome of the status change in the Value field.
Custom class action	You use a custom class action to specify that a custom class file is executed. You define the name and path of the class file in the Value field.
Command line executable action	You use a command line executable action to run the program that you define in the Value field.
Action group	You use an action group to specify that a sequence of actions is executed.
Set value	You use a set value action to specify that the value of a specified field is set.

You can change an action, delete an action, or copy an action. Actions are not copied when a workflow process instance is created. Changing an action affects all process instances that use the action, including existing process instances.

## Deletion rules for actions

You can delete an action record if it is no longer needed and if it is not being used by specific records or elements.

You cannot delete an action record if it is being used with any of the following records or workflow elements:

- Escalations
- Negative connection lines
- Positive connection lines
- Service level agreements

## Working with actions

You can create different types of actions that can be used in escalations, service level agreements, or workflow processes.

- [Creating action records](#)  
You can create action records that can be used as part of an escalation, a service level agreement, or a workflow process. You can create different types of actions.
- [Creating action groups](#)  
You can create a GROUP type of action that contains two or more action records. When the actions in the group are activated, you can specify a sequence to use for those actions.
- [Creating actions specific to workflow](#)  
You can create actions that are associated with a workflow process. Workflow processes use actions to move records through a process and to trigger events, such as status changes.
- [Creating actions specific to escalations](#)  
You can create actions that are associated with an escalation record. An escalation is a mechanism to monitor time-sensitive records, which can take actions or send notifications when a record reaches a defined escalation point.

## Creating action records

You can create action records that can be used as part of an escalation, a service level agreement, or a workflow process. You can create different types of actions.

### Procedure

1. In the Actions application, click New Action.
2. In the Action field, a number is assigned to the action. You can also specify a name for the action.
3. Type a description of the action, or click Long Description to specify additional information.

4. In the Value field, select a value that specifies the type of action to initiate.
  - If you are creating an APPACTION type of action, click Detail Menu to select from the list of available actions. For this type of action, a value is required in the Object field.
  - If you are creating a CHANGESTATUS type of action, type a status for the specified object. For this type of action, a value is required in the Object field.
  - If you are creating a CUSTOM type of action, type the name and path of a class file in the Maximo® directory.
  - If you are creating an EXECUTABLE type of action, type the name and path of an executable file that exists on the server.
  - If you are creating a GROUP type of action, the Value field is read-only.
  - If you are creating a SETVALUE type of action, type the value to which you want the field set. You can click Detail Menu to use the SQL Expression Builder. For this type of action, values are required in the Object and Parameter/Attribute fields.
5. If you are creating an APPACTION, a CHANGESTATUS, a CUSTOM, or a SETVALUE type of action, specify a value in the Object field. Specifying an Object is optional for GROUP and for EXECUTABLE type actions.
6. If you are creating a REVERSEINVOICE type of action, specify a value in the Parameter/Attribute field. You can specify a status for the reverse invoice of either APPR (Approved) or PENDREV (Pending Reversal). A number is automatically assigned to the reverse invoice when it is created.
7. If you are creating a SETVALUE type of action, specify a value in the Parameter/Attribute field. The Parameter/Attribute field contains a relationship tree containing relationships associated with the main object.
8. In the Type field, select a value from the menu of action types. The value in the Type field determines which fields on the action record you can edit, which fields are required, and the values that can be entered in those fields.
9. Optional: If you are creating a CHANGESTATUS type of action, you can use the Memo field to add remarks regarding the status change.
10. Optional: If you are creating an action specifically for use with escalations or workflow, specify a value in the Accessible From field.
11. Click Save Action.

---

## Creating action groups

You can create a GROUP type of action that contains two or more action records. When the actions in the group are activated, you can specify a sequence to use for those actions.

---

### About this task

The following rules apply to action groups:

- If you specify an object for the group, all members of the action group must be for the same object.
- Group type actions cannot be members of an action group.

When you create a GROUP type of action, the Value field, the Parameter/Attribute field, and the Memo field are all read-only.

---

### Procedure

1. On the toolbar of the Actions application, click New Action. If the Action field is empty, type a name for the role.
2. In the Action Description field, type a description, or click Long Description to type additional information.
3. Optional: In the Object field, type a value.
4. In the Type field, select GROUP from the menu of action types.
5. For actions created specifically for use with escalations or workflow, specify a value for the Accessible From field.
6. Click Select Members. You see a list of actions that exist for the specified object. If you do not specify an object, you see a list of action records that do not have a specified object.
  - a. To select an action, select the Select Row check box. You can select more than one action.
  - b. Click OK.
7. Optional: Modify the Sequence field to change the order in which the actions are initiated.
8. Click Save Action.

---

## Creating actions specific to workflow

You can create actions that are associated with a workflow process. Workflow processes use actions to move records through a process and to trigger events, such as status changes.

---

### About this task

You define actions once, and then reuse the actions when you create multiple workflow processes. You use actions when you create and configure the following workflow processes: escalations, negative connection lines, and positive connection lines.

---

### Procedure

1. In the Actions application, click New Action.
2. Optional: Provide a description of the action.
3. Optional: Specify a value for object.
4. Specify the type of action that you are creating.
5. In the Accessible From field, select Workflow.
6. Save your changes.

---

## Creating actions specific to escalations

You can create actions that are associated with an escalation record. An escalation is a mechanism to monitor time-sensitive records, which can take actions or send notifications when a record reaches a defined escalation point.

### Procedure

---

1. In the Actions application, click New Action.
2. Optional: Provide a description of the action.
3. Optional: Specify a value for object.
4. Specify the type of action that you are creating.
5. In the Accessible From field, select Escalation.
6. Save your changes.

---

## Roles

You use the Roles application to manage role records that can be used as part of a communication template, escalation, service level agreement (SLA), or workflow process. When you use a role a process, the process is routed to the correct individual based on information associated with the role record.

A role is a function or position in a business, and can represent a specific job title, such as a department manager. You also can use a role to represent a specific person or a group of people.

- [Roles overview](#)  
You use the Roles application to manage role records that can be used as part of communication templates and escalations. You can also manage role records that can be used as a part of a service level agreement (SLA) or workflow processes.
- [Working with roles](#)  
You can create different types of role records. Role records can be used as part of a communication template, an escalation, a service level agreement (SLA), or a workflow process

---

## Roles overview

You use the Roles application to manage role records that can be used as part of communication templates and escalations. You can also manage role records that can be used as a part of a service level agreement (SLA) or workflow processes.

- [Types of roles](#)  
In the Roles application, you can use a role to represent different functions or positions. When you create role records, you specify a type of role to help determine how the role is resolved when it is encountered in a process.
- [Deletion rules for role records](#)  
To help simplify management of role records, you can delete role records as your business needs change.

---

## Types of roles

In the Roles application, you can use a role to represent different functions or positions. When you create role records, you specify a type of role to help determine how the role is resolved when it is encountered in a process.

The following table describes the types of roles that you can specify when you create a role record.

Type of role	Description
Person	<ul style="list-style-type: none"><li>• You use person type route a record to a specific individual.</li><li>• To create a role record that is a person type, specify Person as the value for the type.</li></ul>
Person group	<ul style="list-style-type: none"><li>• You use the person group type to route a record to one or all members of a person group.</li><li>• To create a role record that is a person group type, specify Person Group as the value for the type.</li><li>• If the broadcast option is selected, then assignments and notifications are sent to all members of the group. If this option is not selected, then the assignment or notification is sent to either the first available group member based on calendar and shift, or to the individual who is the default group assignee.</li></ul>
User data	<ul style="list-style-type: none"><li>• You use the user data type to route a record based on a specific field in the person record. You can also route a record based on a field in a related or child record.</li><li>• To create a role record that is a user data type, specify A set of data related to the login user as the value for the type.</li></ul>
Data set	<ul style="list-style-type: none"><li>• You use the data set type to route a record based on a specific field in a record, or on a field in a related record or child record.</li><li>• To create a role record that is a data set type, specify A set of data related to the record as the value for the type.</li><li>• The record is routed to one or more persons based on the value that you specified in the Value field.</li></ul>

Type of role	Description
Custom class	<ul style="list-style-type: none"> <li>You use the custom class type to resolve one or more people. Custom classes are Java™ programs that are written to perform a specific data management process.</li> <li>To create a role record that is a custom class type, provide the name and the path of a class file that you sourced into the system class path as the value for the type. The class must implement the interface <code>psdi.common.role.CustomRoleInterface</code>.</li> <li>The record is routed to one or more persons based on the data that the custom class returns.</li> </ul>
E-mail address	<ul style="list-style-type: none"> <li>You use the e-mail address type to notify e-mail addresses.</li> <li>To create a role record that is an e-mail address type, specify Email address as the value for the type.</li> <li>Because e-mail addresses can represent individuals who have person records, these addresses can be used for notifications, but not for assignments.</li> </ul>

## Deletion rules for role records

To help simplify management of role records, you can delete role records as your business needs change.

Make sure that the role you want to delete is not being used with any of the following records or workflow elements:

- Communication templates
- Escalations
- Service level agreements
- Workflow negative connection lines
- Workflow positive connection lines
- Workflow Manual input nodes
- Workflow Task nodes
- Workflow Wait nodes

## Working with roles

You can create different types of role records. Role records can be used as part of a communication template, an escalation, a service level agreement (SLA), or a workflow process.

- **Creating role records**  
You use the Roles application to create role records that can be used as part of a communication template, an escalation, a service level agreement (SLA), or a workflow process. You can create different types of roles.

## Creating role records

You use the Roles application to create role records that can be used as part of a communication template, an escalation, a service level agreement (SLA), or a workflow process. You can create different types of roles.

### Procedure

1. On the toolbar, click New Role. If the Role field is empty, type a name for the role.
2. Specify a description or click Long Description to type additional information.
3. Perform one of the following steps:
  - If you are creating a DATASET type of role, specify a value in the Object field.
  - Leave the Object field blank if you are creating any other role type.
4. In the Type field, select a value from the menu. The value in the Type field determines which fields on the role record can be edited, and the values that can be entered in those fields.
5. In the Value field, type a value that specifies how to resolve the role at run time.
  - If Type = CUSTOM, type the name and path of a class file that is in the Maximo directory.
  - If Type = DATASET, click Select Value to select a field from the object specified in the **Object** field.
  - If Type = EMAILADDRESS, type one or more e-mail addresses.
  - If Type = PERSONGROUP, specify a value.
  - If Type = PERSON, specify a value.
  - If Type = USERDATA, specify a value.
6. Perform one or more of the following steps depending on the type of role you are creating:
  - CUSTOM type role: In the Parameter field, specify a parameter to be used with or passed to the custom class.
  - DATASET or USERDATA type role: Select the E-mail check box to indicate that the data set consists of e-mail addresses for individuals who might not have person records.
  - PERSONGROUPID, CUSTOMCLASS, DATASET, or USERDATA type role: Select the Broadcast check box to indicate that assignments and notifications should be sent to all members in a group.
7. Click Save Role.

## Escalations

You use the Escalations application to automatically monitor critical processes in your enterprise. You can either create an escalation or customize a predefined escalation to suit your business needs.

You can create escalations at the site, organization, or system level. If you specify an organization or a site, the escalation is restricted to that site or organization. If you leave do not specify an organization or a site, the escalation is available to all sites and organizations. You can restrict escalations to occur for a specified calendar organization, calendar, and shift. You can also build and validate inactive escalations incrementally, and activate the escalations after validation.

The product includes several predefined escalations, but you can modify them or create your own escalations. For example, you can create an escalation to approve or cancel a record, or reassign a task assignment. An escalation might generate a reminder notification to the assignee regarding the task assignment. An escalation could also send a notification to a supervisor that the assignee did not complete the assignment yet.

The following list describes the most frequent uses for escalations:

- Service desk management - Service level agreements (SLA) are contracts between a service provider and the recipient of the services. You can use escalations to determine how incidents, problems, and service requests are handled. You can also use escalations to ensure that you remain compliant with any SLA by solving problems in a timely manner.
- Information technology (IT) Asset Management - You can use escalations to monitor IT contracts, procurement, and inventory. Defining an escalation to alert supervisors thirty days before a lease contract expires enables the supervisors to effectively manage leases. Defining an escalation also helps to avoid penalties or costly lease extensions.
- Workflow processes - You can use escalations to escalate assignments before they timeout in the inbox of the recipient. In a workflow process, when you assign specific steps to an employee, these assignments display in the inbox of that employee. If the assignments are not completed promptly they timeout in the inbox. An escalation can assign the tasks to other people.

---

## Workflow Designer

You use the Workflow Designer application to create, to view, to modify, and to delete workflow process records that reflect your business processes.

An active workflow process defines the different paths that a record can take as it moves through a business process. The workflow process also specifies the actions and notifications that can take place at different points in a process.

Creating a workflow process involves the following phases:

- Designing the process
- Creating the workflow process
- Validating the process
- Enabling the process
- Activating the process

You create each workflow process record for a business object. An object is a self-contained software entity that consists of both data and functions for manipulating data. Every application is associated with an object. You can create a workflow process either for a main object or for an object with its own applications.

When you specify an object on a process record, the appropriate actions, the communication templates, the escalations, the conditional expressions, and the roles are filtered and displayed as you create the process. The object association also determines which records can be routed through a completed process.

The Workflow Designer application requires a Java™ Virtual Machine (JVM) on the client workstation. If you do not have a JVM installed, the product cannot display the Workflow canvas.

---

## Workflow Administration

You use the Workflow Administration application to view and to manage active instances of workflow processes.

The Workflow Administration application contains a window that displays a row for each active instance of a workflow process. A record can show up multiple times if it is controlled by multiple workflow instances. You can see which version of a revised process was used to create each instance, the person identifier of the individual who routed each record into Workflow, and the date and time that the process was initiated.

The recordkey (for example, the work order number or the purchase order number) displays with the site identifier in the Owner Description field.

---

## Cron Task Setup

You use the Cron Task Setup application to create cron tasks and cron task instances, and to remove cron tasks or cron task instances. You can also change cron task parameters and statuses, and adjust the schedule of a cron task.

Cron tasks have definitions that consist of a name, a class name, an access level, and a description.

You can reschedule cron tasks and change parameter values without stopping and restarting the server.

---

## E-mail Listeners

In the E-mail Listeners application, you can receive and process service request and other types of tickets using e-mail messages. You can create or update tickets. You can also indicate whether the status is changed or queried based on specified criteria.

The E-mail Listeners application can poll multiple e-mail accounts to retrieve messages. Each account is checked at periodic intervals that you establish. Based on the subject line of an e-mail message or the contents of the e-mail message body, an e-mail listener can determine if the e-mail is new or is an updated service request, incident, or problem. An e-mail listener can also determine if an e-mail is a query for information about any business object.

The E-mail Listeners application supports the following features:

- Saving secured embedded elements as attachments
- Embedded and normal message attachments
- Saving and maintaining placement of unsecured embedded images, such as JPEG, PNG, or GIF images
- Processing normal message attachments as attachments
- Supporting POP3 and IMAP e-mail protocols

The E-mail Listeners application cannot process encrypted or digitally signed e-mail messages.

---

## E-mail processing

E-mail processing uses a predefined workflow process. Various steps in the workflow process create, update, or change the status of service requests, incidents or problems. Other steps in the workflow process execute queries and return query results to the originator of the e-mail. You can customize the workflow process or create workflow processes to suit your needs.

All communications from the originators of the e-mail messages are captured in the service request, incident, or problem communication log. Similarly, generated communications sent to the originator of an e-mail message are captured in communication logs.

You can configure the appropriate log levels to get detailed processing and error information from the system log file regarding the E-mail Listeners application processing of e-mails.

- [E-mail Listeners overview](#)  
The E-mail Listeners application can poll multiple e-mail accounts to retrieve messages. Each account is checked at periodic intervals that you establish. Based on the subject line of an e-mail message or the contents of the e-mail message body, an e-mail listener can determine if the e-mail is new or is an updated service request, incident, or problem. An e-mail listener can also determine if an e-mail is a query for information on any business object.
- [Working with E-mail Listeners](#)  
You use e-mail listeners to receive and process incoming e-mail messages. The E-mail Listeners application can monitor multiple e-mail accounts to retrieve messages. It also supports embedded and normal message attachments.

---

## E-mail Listeners overview

The E-mail Listeners application can poll multiple e-mail accounts to retrieve messages. Each account is checked at periodic intervals that you establish. Based on the subject line of an e-mail message or the contents of the e-mail message body, an e-mail listener can determine if the e-mail is new or is an updated service request, incident, or problem. An e-mail listener can also determine if an e-mail is a query for information on any business object.

The application supports the following features:

- Saving secured embedded elements as attachments
- Embedded and normal message attachments
- Saving and maintaining placement of unsecured embedded images, such as JPEG, PNG, or GIF images
- Processing normal message attachments as attachments
- Supporting POP3 and IMAP e-mail protocols

The E-mail Listeners application cannot process encrypted or digitally signed e-mail messages.

---

## E-mail processing

E-mail processing uses a predefined workflow process. Various steps in the workflow process create, update, or change the status of service requests, incidents, or problems. Other steps in the workflow process execute queries and return query results to the originator of the e-mail. You can customize the workflow process or create workflow processes to suit your needs.

All communications from the originators of the e-mail messages are captured in the service request, incident, or problem communication log. Similarly, generated communications sent to the originator of an e-mail message are captured in communication logs.

You can configure the appropriate log levels to generate detailed processing and error information from the system log file regarding how the E-mail Listeners application processes e-mails.

- [Email listeners components](#)  
The Email Listeners application works together with a CRON task and a workflow process to provide full functionality.
- [E-mail listeners process](#)  
Using e-mail listener definitions, the E-mail Listeners application polls the mail server for incoming messages and sends e-mail messages in response. The response e-mail messages confirm that a desired operation was performed on behalf of the user. The e-mail messages also notifies you if there was an error performing the operation.
- [Security settings for e-mail listeners](#)  
As you can create, update, query, and change the status of tickets, you can configure security settings for e-mail listeners. Using these settings, you can ensure that only authorized users can execute these functions using e-mail messages.
- [Communication templates for e-mail listeners](#)  
To generate standardized e-mail notifications, the E-mail Listeners application uses communication templates to generate notifications that are sent to

users and administrators. The types of notifications include confirmations, validation or processing errors, and system errors.

- [Preprocessors for e-mail listeners](#)  
A preprocessor determines whether incoming e-mails messages are new requests for help or updates to existing service requests.
- [E-mail messages](#)  
In the E-Mail Listeners application, you can manage your e-mail messages.

---

## Email listeners components

The Email Listeners application works together with a CRON task and a workflow process to provide full functionality.

The following table lists and describes the Email Listeners components.

Table 1. Email Listeners components

Component	Purpose
Email Listeners application	The application used to create, modify, and delete email listener configurations.
Email listener cron task	A component that runs continuously on the application server and uses the CRON task infrastructure.  This role is performed by the LSNRCRON cron task.  This component encapsulates a staging process that processes inbound email through a staging table.
Workflow process	A workflow process that parses email information from the staging table and processes it according to the subject and contents of each message.

For these components to work correctly, you must first configure your mail servers and email accounts.

---

## E-mail listeners process

Using e-mail listener definitions, the E-mail Listeners application polls the mail server for incoming messages and sends e-mail messages in response. The response e-mail messages confirm that a desired operation was performed on behalf of the user. The e-mail messages also notifies you if there was an error performing the operation.

When the mail server receives an incoming e-mail message, the following events occur:

- The mail server polls for incoming e-mail messages from the designated e-mail account.
- The E-mail Listeners application verifies that the senders of the incoming e-mail messages have person records. If the sender has a person record, the e-mail message is processed. If the sender does not have a person record, the e-mail message is ignored.
- A preprocessor determines whether the e-mail messages are new or updates to existing communications.
- The e-mail messages are staged, which includes the following events:
  - Processing the e-mail message body to locate the content IDs of embedded images.
  - Extracting content from the e-mail messages, including attachments.
  - Storing content in staging tables and attached document tables.
  - Launching the e-mail processing workflow process.
  - If the e-mail listener was configured to use Java™ Messaging Service (JMS) queues, placing e-mail messages in the JMS queue indicating that a new e-mail message needs to be processed. A messaging component picks up this e-mail message from the queue and launches the workflow.
- Using the predefined workflow process, the following events occur:
  - Flagging an e-mail message as new or as an update to an existing service request, incident, or problem
  - For new e-mail messages, creating a service request, incident, or problem, and creating an associated communication log
  - For existing e-mail messages, updating the service request, incident, or problem, and creating an entry in the communication log
- [Predefined workflow process for e-mail listeners](#)  
You use workflow processes to create steps to guide records for your business process. The E-mail Listener application has a predefined workflow, Listener Business Process (LSNRBP), that is used with the E-mail Listeners application.
- [E-mail listeners definitions](#)  
As your business needs change, you can change, copy, or deactivate your e-mail listener definitions.

---

## Predefined workflow process for e-mail listeners

You use workflow processes to create steps to guide records for your business process. The E-mail Listener application has a predefined workflow, Listener Business Process (LSNRBP), that is used with the E-mail Listeners application.

By default, the LSNRBP process is enabled and active. To meet your business needs, you can revise the process or create a process in the Workflow Designer application.

When you associate the LSNRBP workflow process to a configuration, the e-mail listener submits each record in the staging table to the LSNRBP process. The LSNRBP process performs the following functions based on the contents of the e-mail message:

- Changes the status of an existing ticket or other business object
- Updates an existing ticket
- Creates a ticket
- Queries any business object and return results

The LSNRBP process generates response e-mail messages at various points during e-mail processing. For example, a response containing the service request number is sent to the originator of an e-mail message whenever the application creates a service request. Response e-mail messages are also generated whenever an update is made to an existing ticket or when queries are performed.

## E-mail listeners definitions

As your business needs change, you can change, copy, or deactivate your e-mail listener definitions.

### Deactivation of definitions

In the E-mail Listeners application, you can deactivate an e-mail listener definition to help simplify e-mail management. For example, you can deactivate an e-mail listener definition to migrate to a new mail server or to perform routine system maintenance. To deactivate an e-mail listener definition, use the Activate/Deactivate Listener action. When you deactivate an e-mail listener definition, messages on the mail server are not monitored and service requests are not created.

### Changes to definitions

You can change the attributes of an e-mail listener definition. You can change all values, except for the e-mail address, cron task name, cron task instance, and last time run. You must deactivate an e-mail listener definition before you can change it.

If you need to change the format of the e-mail address on an account, you must create an e-mail definition. For example, if you want to change help@company.com to customer\_service@company.com. To create a definition, use the Duplicate Listener action in the E-mail Listeners application.

### Duplication of definitions

You can duplicate an e-mail listener definition to simplify the management of e-mail records. When you duplicate an e-mail listener definition, you can specify new account information.

When you duplicate an e-mail listener definition, the following points apply:

- Some mail servers are case-sensitive.
- The case of the e-mail address that you specify is preserved.
- You cannot save an e-mail listener definition if it has an e-mail address with the same name and case as an existing e-mail address on the mail server.

## Security settings for e-mail listeners

As you can create, update, query, and change the status of tickets, you can configure security settings for e-mail listeners. Using these settings, you can ensure that only authorized users can execute these functions using e-mail messages.

For the sender of an e-mail message, security authorizations are checked against the security configuration for the system. This check establishes the ability of the sender to run each specific function.

The person record is a basic requirement to be able to process e-mail messages. Additional processing of e-mail messages only occurs after the person record associated with the e-mail address of the sender has been located.

The following points apply to security settings for e-mail listeners:

- If a person record is active, the corresponding user record is found.
- If a person record does not exist or is inactive, the e-mail message is not processed. An error e-mail message is sent to the sender and the administrator.
- If a user record is found, the associated authorizations are applied when the E-mail Listeners application performs security checks on incoming e-mail messages.
- If a user record is not found, the **Run As user** of the cron task instance for the e-mail listener is used.

To specify security settings for e-mail listeners, you can use the Select Security Settings action in the E-mail Listeners application. The settings identify business objects supported by each e-mail listeners workflow process. The settings also identify the corresponding applications that must be used to determine security restrictions on incoming e-mail messages. To assign the appropriate authorizations to the users who send formatted e-mail messages, configure security settings you can use the Security Groups application.

## Scenarios of security authorization

The following table describes the two security authorization scenarios that are supported when a user ID exists.

Table 1. Security authorization scenarios that are supported when a user ID exists

Scenario	Support
The user exists and has authorization to perform the operation specified in the e-mail message.	<ul style="list-style-type: none"><li>• The e-mail listener performs the security check based on the sender of an incoming e-mail message.</li><li>• When the user record for the sender is located, the e-mail listener builds a security profile of the user to determine authorizations.</li><li>• If the user has authorization to perform add, update and change status operations, the e-mail message is processed accordingly.</li></ul>

Scenario	Support
The user exists but does not have authorization to perform the operation specified in the e-mail message.	<ul style="list-style-type: none"> <li>The user can update or query only records that the user created.</li> </ul>

## Communication templates for e-mail listeners

To generate standardized e-mail notifications, the E-mail Listeners application uses communication templates to generate notifications that are sent to users and administrators. The types of notifications include confirmations, validation or processing errors, and system errors.

When the E-mail Listeners application successfully processes an incoming e-mail message, a confirmation notification is generated.

The following table lists the templates that are used for confirmation notifications.

Table 1. Templates for confirmation notifications

Templates	Confirmation situation	Recipients
LSNRBPCBSR	Confirms the creation of a service request based on an incoming free-form e-mail message.	Sender of original e-mail message.
LSNRBPCHST	Confirms the status change of records based on an incoming e-mail message.	Sender of original e-mail message.
LSNRBPQRY	Response e-mail message containing details of query results from an incoming e-mail message.	Sender of original query e-mail message.
LSNRBPUBSR	Confirms the update of a service request based on an incoming free-form e-mail message.	Sender of original e-mail message.
LSNRBPUBJ	Confirms the update of a specified object based on an incoming e-mail message.	Sender of original e-mail message.
LSNRBPCOBJ	Confirms the creation of a specified object based on an incoming e-mail message.	Sender of original e-mail message.

A validation or processing error notification is generated when the E-mail Listeners application cannot process an incoming e-mail message. This error could be because of incorrect formatting or incomplete or invalid information in the incoming e-mail message. You must review the error in the log file or in the e-mail to resolve the error.

The following table lists the templates that are used for the validation or processing of error notifications.

Table 2. Templates for validation or processing error notifications

Template used for validation or processing error notification	Error situation	Corrective action	Recipients
LSNRAUTH	Validation error notification The sender does not have authorization to perform the operation specified in the incoming e-mail message.	Authorize the user for the specified application.	Sender of original e-mail message and system administrator.
LSNRBPAUTO	Processing error notification The e-mail listener cannot create an auto key for an attribute that was declared as auto key in the incoming e-mail message.	Verify that the attribute is declared as an auto key. If the attribute is declared as an auto key, check the logs.	Sender of original e-mail message.
LSNRBPDATE	Validation error notification The sender did not specify a properly formatted date or date time value for an attribute that was specified in the incoming e-mail message.	Provide a valid formatted date.	Sender of original e-mail message and system administrator.
LSNRBPINV	Processing error notification The sender specified an update operation for an existing record in the incoming e-mail message, but the record does not exist.	Provide a valid record.	Sender of original e-mail message.
LSNRBPACN	Processing error notification The sender specified an invalid action in the incoming e-mail message.	Provide a valid action.	Sender of original e-mail message.
LSNRBPUNOB	Processing error notification The sender specified an object in the incoming e-mail message that the E-mail Listeners application does not support.	Provide a valid object name. There are only 3 valid objects for create and update action: service requests, problems, and incidents.	Sender of original e-mail message.
LSNRFNKEY	Processing error notification The sender did not provide all of the primary keys for a record that was specified in the incoming e-mail message.	Provide input for the mandatory key fields.	Sender of original e-mail message.
LSNRFNREQ	Processing error notification The sender did not provide all of the required attributes for a record that the sender specified in the incoming e-mail message.	Provide input for all mandatory fields.	Sender of original e-mail message.
LSNRINVM	Validation error notification The incoming e-mail message contains a blank subject line or a subject line that exceeds the allowed length (this error occurs only in free-form e-mail messages).	Enter a subject or reduce the length of the subject.	Sender of original e-mail message.
LSNRNOPER	Validation error notification The sender of the incoming e-mail message does not have a corresponding person record.	Sender of the e-mail must be defined as a person.	Sender of original e-mail message and system administrator.
LSNRSECAPP	Validation error notification The sender of the incoming e-mail message does not have the requisite authorizations to perform the operation on the object specified in the e-mail message.	Provide the authorizations needed for the object in the Security Settings window of the E-mail Listener application.	Sender of original e-mail message and system administrator.

Template used for validation or processing error notification	Error situation	Corrective action	Recipients
LSNRWFMT	Processing error notification The incoming e-mail message has invalid formatted content.	Format the content of the e-mail correctly.	Sender of original e-mail message and system administrator.

If a system error occurs when the E-mail Listeners application polls or processes an incoming e-mail message, a system error notification is generated.

The following table lists the templates that are used for system error notifications.

Table 3. Templates for system error notifications

Templates used for system error notifications	Error situation	Recipients
LSNRBPEX	Processing the incoming e-mail message.	System administrator. To ensure that the sender of the original email also receives the error notification, set the <code>mx.lsnr.notifyusererror</code> property to 1.
LSNRBPQERR	Placing information about an incoming e-mail message into JMS queue.	System administrator
LSNRCFGERR	Using the listener configuration to connect to an e-mail account.	System administrator
LSNRCONNF	Connecting to the mail server to access the configured e-mail account.	System administrator
LSNRERROR	Processing the incoming e-mail message.	Depending on the error, sender of the original e-mail message or system administrator.
LSNRINBF	Staging the contents of the incoming e-mail message in the internal staging table.	System administrator
LSNRJMSCF	Connecting to the configured JMS queue because the queue connection factory information for the queue is incorrect.	System administrator
LSNRJMSF	Connecting to the configured JMS queue.	System administrator
LSNRJMS	Connecting to the configured JMS queue because the queue information is incorrect.	System administrator
LSNRJMMSSYN	Connecting to the configured JMS queue, and further processing of e-mail message is performed without the JMS queue.	System administrator
LSNRMAILER	Retrieving e-mail message from the configured e-mail account.	System administrator

## Preprocessors for e-mail listeners

A preprocessor determines whether incoming e-mails messages are new requests for help or updates to existing service requests.

The preprocessor is a Java™ component of the e-mail listener that runs on the server when the e-mail listener recognizes a new e-mail message. The preprocessor parses the subject line of any incoming e-mail message to determine whether the message is a new request for help or an update to an existing service request. By default, a built-in preprocessor parses incoming e-mail messages. The default preprocessor value is: `psdi.common.emailstner.Preprocessor`. In the E-mail Listeners application, this value displays in the Preprocessor field on the Listener tab.

The preprocessor class extracts the string that is bounded by the object key delimiter characters, which identifies an existing service request. If a string is recognized, the preprocessor stores the string in the object key column in the e-mail listener staging table. If no string is recognized, the preprocessor leaves the object key column blank.

## Customized preprocessors

The base preprocessor Java class implements a standard Java interface called the `LSNRPreprocessor`. Custom preprocessor implementations must include an implementation of the `LSNRPreprocessor` interface.

The preprocessor interface provided with the system includes the following public methods:

- Boolean `isNewEmail` (String del, String subject)
- String `getObjectKey` (String del, String subject)

In the custom Java class, you can implement both methods. Each method accepts two parameters: the delimiter string and the subject line string.

Table 1. Methods

Method	Description	Base preprocessor implementation	Custom implementation
<code>isNewEmail()</code>	Returns a Boolean value indicating whether the e-mail is for a new or for an existing ticket	Checks whether the Object Key Delimiter string occurs exactly twice in the subject line string	Might provide different logic to determine the new or existing ticket
<code>getObjectKey()</code>	<ul style="list-style-type: none"> <li>• Returns a string that represents the Ticket ID</li> <li>• Returns null, if no ID is found</li> </ul>	Extracts the substring between the first and last occurrences of the delimiter string in the subject line	Might provide different logic to determine the Ticket ID

- [Object key delimiters](#)  
The E-mail Listeners application uses an object key delimiter to identify the incoming e-mail message as an existing ticket.
- [Logging](#)  
You can use logging to create and to manage log files that contain informational, warning, or error messages regarding the processing of e-mail messages.

---

## Object key delimiters

The E-mail Listeners application uses an object key delimiter to identify the incoming e-mail message as an existing ticket.

Object key delimiters specify characters on either side of the service request key in the subject line of incoming e-mail messages. The default value in the Object Key Delimiter field is `##`. For example, service request number 1009 is represented as `##1009##`, with no spaces before or after the service request key.

You can change the default value, and replace the value before and after the ticket ID with other characters. There are no restrictions regarding the characters that you can use. However, the delimiter must be unique. Choose characters or symbols that are not frequently used. For example, you use `+` as the object key delimiter, and a user sends an e-mail message with the subject line: `+1003+`

**Having problems with printer + network.** The preprocessor cannot identify the substring because the object key delimiter symbol occurs multiple times in the subject line.

When you send e-mail messages that reference existing service requests, place the characters that you choose as the object key delimiter before and after the service request key. The preprocessor class extracts the string that is bounded by the object key delimiter characters, which identifies an existing service request. If a string is recognized, the preprocessor stores it in the object key column in the e-mail listener staging table. If no string is recognized, the preprocessor leaves the object key column blank.

---

## Object key identifier

An object key identifier is the ID of a record. The object key identifier can be a sequence that is generated. For example, object key identifiers can be 1001, 1002, and so on.

---

## Logging

You can use logging to create and to manage log files that contain informational, warning, or error messages regarding the processing of e-mail messages.

You use the Logging application to create and to manage log files.

---

## E-mail messages

In the E-Mail Listeners application, you can manage your e-mail messages.

- [Polling of mail servers for email messages](#)  
Using email listener definitions, the email Listeners application uses a dedicated cron task to poll the mail server for incoming messages. Cron tasks are Java™ components that you can set to run automatically and on a fixed schedule. For each email listener definition that you create, a specific instance of the cron task is created and associated with the email listener.
- [Status of e-mail records](#)  
Every e-mail record in the staging table has an associated status. These statuses reflect the sequence of actions that the e-mail listener performs on an e-mail record in the staging table.
- [E-mail attachments](#)  
The E-mail Listeners application stores attachments from incoming e-mail on the application server. You can view attachments in the E-mail Processing tab of the E-mail Listeners application.
- [Message thresholds](#)  
If the number of messages waiting to be processed exceeds the high message threshold that you set, the application server limits the addition of new messages in the processing queues.
- [E-mail formats for e-mail listeners](#)  
The E-mail Listeners application can process free form e-mail messages or formatted e-mails. You can configure a system property to determine how some alternative e-mail formats are processed.

---

## Polling of mail servers for email messages

Using email listener definitions, the email Listeners application uses a dedicated cron task to poll the mail server for incoming messages. Cron tasks are Java™ components that you can set to run automatically and on a fixed schedule. For each email listener definition that you create, a specific instance of the cron task is created and associated with the email listener.

The scheduling value determines the polling frequency. The polling frequency is stored as an attribute of each cron task instance. Specify different schedules for different email accounts. By default, the schedule for the polling frequency is set to every 5 minutes.

The cron task polls the mail server at the set frequency and performs the following actions:

Table 1. Cron task actions

Condition	Mail server action
For new email messages on the mail server	<p>The mail server:</p> <ul style="list-style-type: none"> <li>• Extracts the header and message body</li> <li>• Extracts any attachments</li> <li>• Moves the email to e-mail staging</li> <li>• Marks the email message as read</li> </ul>
For email messages marked as read on the mail server	<p>The mail server determines whether read email messages are deleted:</p> <ul style="list-style-type: none"> <li>• If an email message is to be deleted, it marks the email message as deleted</li> <li>• If an email message is not to be deleted, it keeps the email message on the server</li> </ul>

For email messages processed from a POP-based mail account, the Email Listener determines whether an email is already processed or is new.

- **Queues**  
A queue is an application server component that can facilitate parallel processing. Associating a queue with an e-mail listener can speed up the sequential processing of incoming e-mails, especially when they are arriving in high volume.
- **Staging e-mail messages**  
Using an e-mail listener cron task, the E-mail Listeners application stages e-mail messages to a staging table. When staging an e-mail message, the application saves all information that is required to process the e-mail message and initiate the workflow process. Cron tasks are behind-the-scene jobs that run automatically and on a fixed schedule.

## Queues

A queue is an application server component that can facilitate parallel processing. Associating a queue with an e-mail listener can speed up the sequential processing of incoming e-mails, especially when they are arriving in high volume.

The E-mail Listeners application processes incoming e-mail messages in a sequential manner. The sequence of processing includes polling the mail server, staging the mail into the database, and launching workflow processing on the staged mail record. In situations where high volumes of e-mail messages must be processed efficiently, this sequential processing can be time-consuming. This means that e-mail messages are not always processed as quickly as possible. Therefore, it can be beneficial to switch the e-mail listener to a parallel processing mode. To perform this switch, you can configure a queue and associate the queue with the listener. The system uses Java™ Messaging Service (JMS) queues, provided by the underlying Java application server.

Once a message is placed in a queue, the message processing component can pick the message up in an asynchronous manner. In the Java application server, the processing components are called message-driven beans (MDBs). You can configure the application server to provide multiple MDBs that process multiple messages in parallel. This increases the speed at which the E-mail Listeners application processes e-mails.

Once you set up the queues, you can modify or create an e-mail listener definition to specify queue-based processing, the queue name, and the queue connection factory name.

## Staging e-mail messages

Using an e-mail listener cron task, the E-mail Listeners application stages e-mail messages to a staging table. When staging an e-mail message, the application saves all information that is required to process the e-mail message and initiate the workflow process. Cron tasks are behind-the-scene jobs that run automatically and on a fixed schedule.

A staging table stores the attributes of an incoming e-mail message, including the recipients, the sender, the subject, and the message. The staging process creates a record, and the workflow process determines how to process the record.

If an incoming e-mail message generates a ticket, details of the e-mail message are stored as the initial entry in the communication log of the ticket. Any further correspondence is stored, based on the key of the ticket. Graphics, whether they are embedded in or attached to the e-mail message, are also visible in the communication log. You can view communication logs from the Log tab of the Service Request application.

## Errors found during staging

If the E-mail Listeners application finds any errors while staging e-mail records, the e-mail listener can write error information in the log file on the server. You use the Logging application to enable logging for the E-mail Listeners application.

In addition, you can receive error notifications if the E-mail Listeners application encounters errors during staging. To receive the error notifications, you must provide a valid e-mail address in the Administrator E-mail field. The notification that is sent to the e-mail address for the administrator contains a detailed description of the errors.

## Status of e-mail records

Every e-mail record in the staging table has an associated status. These statuses reflect the sequence of actions that the e-mail listener performs on an e-mail record in the staging table.

The possible statuses for e-mail records are described in the following table.

Table 1. Statuses of e-mail records

Status	Description
New	<ul style="list-style-type: none"> <li>If an e-mail message is received with a subject, an e-mail record for the e-mail message is created in the staging table. The status of the e-mail record is set to new.</li> <li>The e-mail record is separated into discrete components (such as to, from, cc, subject, and message). Any attachments are extracted and stored on the file system where the system server resides.</li> <li>Attachments are linked to new attached documents records. The records are linked to the e-mail record in the staging table.</li> </ul>
In process	<ul style="list-style-type: none"> <li>During the processing of a new e-mail record, the status of the e-mail record is set to in process.</li> </ul>
Workflow	<ul style="list-style-type: none"> <li>When the workflow process is initiated, the status of the e-mail record is set to workflow.</li> <li>The workflow process either creates a new service request and communication log, or updates an existing service request.</li> </ul>
Invalid	<ul style="list-style-type: none"> <li>If an e-mail message is received without a subject, an e-mail record for the e-mail message is created in the staging table. The status of the e-mail record is set to invalid.</li> <li>The e-mail record remains in the staging table. The e-mail record is not processed further. That is, the e-mail record does not enter the workflow process.</li> <li>An administrator can use the resubmit function to correct an e-mail record with an invalid status. When an e-mail is resubmitted, the status is changed to new. The e-mail record is processed as a new e-mail message.</li> </ul>
Error	<ul style="list-style-type: none"> <li>If an error is encountered during the staging of e-mail records, the status of the e-mail record is set to error. An error notification is sent to the administrator specified during the configuration of the e-mail listener.</li> <li>If an e-mail address for the administrator was not specified and if logging is enabled, an error is written to the <code>Maximo.log</code> file.</li> <li>If an e-mail record has an error status, that e-mail record is not processed until the error is resolved.</li> <li>An administrator can use the resubmit function to correct an e-mail record with an error status. When an e-mail is resubmitted, the status is changed to new. The e-mail record is processed as a new e-mail message.</li> </ul>
Complete	<ul style="list-style-type: none"> <li>Once the workflow process completes successfully, the status of the e-mail record in the staging table is set to complete.</li> </ul>

## E-mail attachments

The E-mail Listeners application stores attachments from incoming e-mail on the application server. You can view attachments in the E-mail Processing tab of the E-mail Listeners application.

The mail server can control the size of the attachment. You can contact your mail server administrator to discuss these controls, and to determine the file types allowed on the E-mail Listeners mail server.

You can configure the `mx.listener.process.cidimages` property to determine how images that are embedded in free-form e-mails are processed in the E-mail Listeners application. By default, the property is set to 1, and images are embedded as a hyperlink in the long description of the service request and also added as individual attachments to the service request. If the property is set to 0, images are added as an attachment to the service request but are not embedded in the long description. Supported image formats include JPEG, PNG, and GIF.

The E-mail Listeners application does not modify the display size of the image when it is embedded into the long description of the service request.

## Example

In the following example, the `mx.listener.process.cidimages` property is set to 1.

Sally tries to print a file and receives an indecipherable error message. She sends a free-form e-mail that describes the problem to `help@support.com`, the company site for service desk e-mail requests. In the middle of her e-mail, Sally embeds a JPEG image of the error message. The E-mail Listener application retrieves the message from Sally and creates a service request with identifier 123.

Frank, a service desk agent, reviews service request #123. He can click the link that is embedded in the long description of the service request to view the error message. Frank searches the knowledge base and finds a solution. He opens the Communications Log containing the initial e-mail from Sally, creates a communication with the solution, and sends it to her.

All details of the interaction between Frank and Sally are stored in the Communications Log for service request #123.

## Message thresholds

If the number of messages waiting to be processed exceeds the high message threshold that you set, the application server limits the addition of new messages in the processing queues.

Depending on your message requirements, you might want to type a higher message threshold value. To determine an optimal message threshold setting, you can monitor the messaging in/out queues and the impact of the message threshold setting on system performance. For example, you can lower the threshold value if a higher value is degrading system performance.

If you decide to change the high message threshold setting after the initial configuration, you must open the Additional Properties menu in the administrative console. You can then change the threshold value for each child configuration.

- Bounced e-mail messages**

Bounced e-mail messages are outbound e-mail messages that cannot be delivered. Large volumes of bounced e-mail messages create excess network traffic and affect the processing of legitimate tickets.

- [Deletion of e-mails from the mail server](#)

You can manage your e-mail message by specifying a set of rules to mark e-mail messages on the mail server for deletion. You can delete e-mail records with statuses of complete, error, or invalid. When you delete e-mail records in the E-mail Listeners application, the e-mail records are completely removed and cannot be retrieved.

---

## Bounced e-mail messages

Bounced e-mail messages are outbound e-mail messages that cannot be delivered. Large volumes of bounced e-mail messages create excess network traffic and affect the processing of legitimate tickets.

The mail server generates and returns bounced e-mail messages to the e-mail listener account that was specified in the Send From field. The e-mail listener treats these messages as service requests.

You can use the following approach to address bounced e-mail messages:

- To preserve the integrity of the primary e-mail listener account, you can create a dedicated e-mail account for bounced e-mail notifications.
- You can base any outbound e-mail notifications on communication templates in which the Send From field in the template specifies the dedicated bounced e-mail account. An e-mail message is then generated and sent to the address in the Send From field.

---

## Deletion of e-mails from the mail server

You can manage your e-mail message by specifying a set of rules to mark e-mail messages on the mail server for deletion. You can delete e-mail records with statuses of complete, error, or invalid. When you delete e-mail records in the E-mail Listeners application, the e-mail records are completely removed and cannot be retrieved.

You can use the E-mail Deleted option to manage the deletion of e-mails, or delete e-mails manually:

- If you use the E-mail Deleted option, the age threshold value and age unit of measure value are used to mark e-mail messages for deletion at set intervals on the mail server. The default value of the age threshold is seven. The default value of the age unit of measure is days.
- If you do not use the E-mail Deleted option, read e-mail messages remain on the mail server, regardless of how long messages have been there. In this case, your mail administrator must manage the deletion of e-mail messages from the mail server.

---

## Example

If the age threshold is set to seven and the age unit of measure is days, any read e-mail message that have been on the mail server for seven days are deleted. If you set the age threshold value to zero, any read e-mail marked is deleted from the mail server immediately.

---

## E-mail formats for e-mail listeners

The E-mail Listeners application can process free form e-mail messages or formatted e-mails. You can configure a system property to determine how some alternative e-mail formats are processed.

Typically, an e-mail contains only plain text, only HTML text, or both HTML and plain text. An e-mail that contains both HTML and plain text is a multipart alternative e-mail. You can configure the `mx.listener.multipart.alternative.html` property to determine how multipart alternative e-mails are processed. When the property is set to 1, the HTML version of the e-mail message body is used. When the property is set to 0, the plain text version of the e-mail message body is used.

---

## Free form e-mails

Free form e-mails do not follow any specific structure. The E-mail Listeners application first extracts the subject line and body of free form e-mails. Then, it uses the subject line or body to either create a service request or to update an existing ticket.

Free form e-mails are always processed as service requests. If you plan to support other types of tickets, use formatted messages only.

---

## Formatted e-mails

Formatted e-mails use specific structure in the message body to instruct the E-mail Listeners application to manipulate various types of tickets and business objects. Formatted e-mails can be composed using XML tags or text typed in the form of attribute-value pairs. They can perform specific actions, such as changing the status of a business object or querying the business object based on criteria. QUERY, CREATE or UPDATE, and CHANGE STATUS e-mails are all types of formatted e-mails.

However, if the `mx.listener.multipart.alternative.html` property is set to 1, only the non-XML `Key=Value` format type can be used in the message body. If the `mx.listener.multipart.alternative.html` property is set to 0, both XML and non-XML format types can be used.

To support other business objects, you can create your own workflow process and associated processing logic. A built-in workflow process that supports various types of ticket objects is shipped.

- [Formatted e-mail keywords](#)

Formatted e-mails must be carefully composed to ensure that the e-mail listener successfully processes e-mails and that the system performs the necessary actions. You can use specific keywords in the body of the e-mail message to compose a correctly formatted e-mail.

- [Rules for formatted e-mail messages with attribute-value pairs](#)  
You can use attribute-value pairs to compose formatted e-mail messages.
- [Examples of formatted e-mail messages using change status function](#)  
You can compose formatted e-mail messages that use the change status function. You compose these messages using attribute-value pairs or XML tags.
- [Examples of formatted e-mail messages using create and update functions](#)  
You can compose formatted e-mail messages that use the create and update functions. You compose these messages using XML tags or attribute-value pairs.
- [Examples of formatted e-mail messages using query function](#)  
You can compose formatted e-mail messages that use the query function. You compose these messages using attribute-value pairs or XML tags.

## Formatted e-mail keywords

Formatted e-mails must be carefully composed to ensure that the e-mail listener successfully processes e-mails and that the system performs the necessary actions. You can use specific keywords in the body of the e-mail message to compose a correctly formatted e-mail.

There are two sets of keywords that you can use, depending on whether you want to implement attribute-value pair formatting or XML formatting. The following table specifies the keywords that apply when using attribute-value pairs or XML.

Table 1. Keywords for formatted e-mails

Keyword	Format type	Required	Purpose
#MAXIMO_EMAIL_BEGIN	Attribute-value pairs	Yes	The keyword marks the beginning of formatted e-mail content in an e-mail message.
#MAXIMO_EMAIL_END	Attribute-value pairs	Yes	The keyword marks the end of formatted e-mail content in an e-mail.
LSNRAPPLIESTO	Both	Yes	A value must be provided. The value represents a business object upon which an operation is performed.
LSNRACTION	Both	Yes	A value must be provided. The value can be CREATE, UPDATE, CHANGESTATUS or QUERY. The value specifies the operation to be performed on the business object.
LSNRWHERECONDITION	Both	No	The keyword is used only in e-mails that query a business object. The value represents a valid SQL where condition that is to be applied on the business object.
LSNRRESULTCOLUMNS	Both	No	The keyword is used only in e-mails that query a business object. The value represents one or more columns from the business object. The values are returned in the response e-mail to the query.
&AUTOKEY&	Both	No	The keyword is used as a value for an attribute or an XML tag for e-mail messages that are intended to create business objects. If this keyword is used, the particular attribute is autokeyed using standard system.
&SYSDATE&	Both	No	The keyword is used as a value for an attribute or an XML tag for e-mail messages that are intended to create business objects. If this keyword is used, the value for the particular attribute is a standardized date format as derived from the underlying system database.
<MAXIMOEMAILCONTENT> </MAXIMOEMAILCONTENT>	XML	Yes	This tag is used only in XML formatted e-mails to specify the contents of the e-mail message. This tag serves as the root of the XML document being composed in the e-mail message.

## Rules for formatted e-mail messages with attribute-value pairs

You can use attribute-value pairs to compose formatted e-mail messages.

The following rules apply when you use attribute-value pairs to compose a formatted e-mail message:

- Formatted e-mail messages must contain the **#MAXIMO\_EMAIL\_BEGIN** keyword and **#MAXIMO\_EMAIL\_END** keyword. If these keywords are not included in the e-mail message, the e-mail message is not processed and an error response e-mail message is sent to the originator of the e-mail message.
- All of the attribute-value pairs specified in the e-mail message must occur together. The e-mail listener ignores any other text typed in the e-mail message. Demarcate the attribute-value pairs in the e-mail message with the **#MAXIMO\_EMAIL\_BEGIN** keyword and the **#MAXIMO\_EMAIL\_END** keyword. You must place these keywords on a separate line and end with a new line.
- An e-mail message must contain both the **#MAXIMO\_EMAIL\_BEGIN** and **#MAXIMO\_EMAIL\_END** keywords for the e-mail to be treated as a formatted e-mail. If one or both of the **#MAXIMO\_EMAIL\_BEGIN** and **#MAXIMO\_EMAIL\_END** keywords are excluded, the e-mail message is treated as free-form text.
- The syntax for the attribute-value pairs is: **Field Title#Attribute Name=Value**.
- You must place the semi colon character on a new line by itself. This character serves as the separator between one field-value pair and the next field-value pair.
- The field title represents the title for the field as displayed in applications. The attribute name represents the attribute name as specified in the MAXATTRIBUTE table. Typically, this name is the same as the database column name.
- An incoming e-mail message can contain both the field title and the attribute name separated by #, only the field title, or only the attribute name. If only the field title is provided, the e-mail listener attempts to map the field title to the appropriate attribute name before processing the e-mail message. If the e-mail listener cannot map the title or resolve the attribute name, the e-mail message is not processed and an error response e-mail message is sent to the originator of the e-mail message.
- You can place inline attachments before or after the **#MAXIMO\_EMAIL\_BEGIN** keyword and **#MAXIMO\_EMAIL\_END** keyword.

## Examples of formatted e-mail messages using change status function

You can compose formatted e-mail messages that use the change status function. You compose these messages using attribute-value pairs or XML tags.

## Examples

The following table contains examples of formatted e-mail messages that use the change status function. These examples were composed with attribute-value pair and XML tags. You can use these examples as reference or as a template to create formatted e-mail messages in the E-mail Listeners application.

Table 1. Examples of formatted e-mail messages that use the change status function

Description	Example
Attribute-value pair change status function	
Change the status of an existing service request	<pre>#MAXIMO_EMAIL_BEGIN LSNRACTION=CHANGESTATUS ; LSNRAPPLIESTO=SR ; CLASS=SR ; TICKETID=SRNUM ; STATUS=INPROG ; #MAXIMO_EMAIL_END</pre>
XML change status function	
Change the status of an existing service request	<pre>&lt;MAXIMOEMAILCONTENT&gt; &lt;LSNRACTION&gt;CHANGESTATUS&lt;/LSNRACTION&gt; &lt;LSNRAPPLIESTO&gt;SR&lt;/LSNRAPPLIESTO&gt; &lt;STATUS&gt;QUEUED&lt;/STATUS&gt; &lt;TICKETID&gt;&lt;SRNUM&gt;&lt;/TICKETID&gt; &lt;CLASS&gt;SR&lt;/CLASS&gt; &lt;SITEID&gt;BEDFORD&lt;/SITEID&gt; &lt;/MAXIMOEMAILCONTENT&gt;</pre>

## Examples of formatted e-mail messages using create and update functions

You can compose formatted e-mail messages that use the create and update functions. You compose these messages using XML tags or attribute-value pairs.

## Examples

The following table contains examples of formatted e-mail messages that use the create and update functions. These examples were composed with attribute-value pair and XML tags. You can use these examples as reference or as a template to create formatted e-mail messages in the E-mail Listeners application.

Table 1. Examples of formatted e-mail messages that use attribute-value pair create or update functions

Attribute-value pair create or update function	Example
Create a service request	<pre>#MAXIMO_EMAIL_BEGIN LSNRACTION=CREATE ; LSNRAPPLIESTO=SR ; TICKETID=&amp;AUTOKEY&amp; ; CLASS=SR ; DESCRIPTION= My SR Attribute - value pairs creation TEST ; #MAXIMO_EMAIL_END</pre>
Update specific attributes of an existing service request	<pre>#MAXIMO_EMAIL_BEGIN LSNRACTION=UPDATE ; LSNRAPPLIESTO=SR ; TICKETID=SRNUM ; CLASS=SR ; DESCRIPTION=Update reported by, priority and classification test. ; REPORTEDPRIORITY=2 ; CLASSTRUCTUREID=1087 ; #MAXIMO_EMAIL_END</pre>

Table 2. Examples of formatted e-mail messages that use XML create or update functions

XML create or update function	Example
Create a service request	<pre>&lt;MAXIMOEMAILCONTENT&gt; &lt;LSNRACTION&gt;CREATE&lt;/LSNRACTION&gt; &lt;LSNRAPPLIESTO&gt;SR&lt;/LSNRAPPLIESTO&gt; &lt;TICKETID&gt;&lt;![CDATA[&amp;AUTOKEY&amp;]]&gt;&lt;/TICKETID&gt; &lt;CLASS&gt;SR&lt;/CLASS&gt; &lt;DESCRIPTION&gt;My XML SR creation e-mail test&lt;/DESCRIPTION&gt; &lt;/MAXIMOEMAILCONTENT&gt;</pre>

XML create or update function	Example
Update an existing service request	<pre> &lt;MAXIMOEMAILCONTENT&gt; &lt;LSNRACTION&gt;UPDATE&lt;/LSNRACTION&gt; &lt;LSNRAPPLIESTO&gt;SR&lt;/LSNRAPPLIESTO&gt; &lt;TICKETID&gt;SRNUM&lt;/TICKETID&gt; &lt;CLASS&gt;SR&lt;/CLASS&gt; &lt;COMMODITYGROUP&gt;IT&lt;/COMMODITYGROUP&gt; &lt;COMMODITY&gt;PC&lt;/COMMODITY&gt; &lt;DESCRIPTION&gt;My XML update of service group, service, and site field&lt;/DESCRIPTION&gt; &lt;SITEID&gt;BEDFORD&lt;/SITEID&gt; &lt;/MAXIMOEMAILCONTENT&gt; </pre>

## Examples of formatted e-mail messages using query function

You can compose formatted e-mail messages that use the query function. You compose these messages using attribute-value pairs or XML tags.

### Examples

The following table contains examples of formatted e-mail messages that use the query function. These examples were composed with attribute-value pair and XML. You can use these examples as reference or as a template to create formatted e-mail messages in the E-mail Listeners application.

Table 1. Examples of formatted e-mail messages that use the query function

Description	Example
Attribute-value pair query function	
Query a single record with criteria (LSNRWHERECONDITION keyword)	<pre> #MAXIMO_EMAIL_BEGIN LSNRACTION=QUERY ; LSNRAPPLIESTO=SR ; LSNRRESULTCOLUMNS=TICKETID,DESCRIPTION, REPORTEDBY,COMMODITYGROUP ; LSNRWHERECONDITION=TICKETID='1001' AND SITIED ='BEDFORD' ; #MAXIMO_EMAIL_END </pre>
Query a single record without criteria (LSNRWHERECONDITION keyword)	<pre> #MAXIMO_EMAIL_BEGIN LSNRACTION=QUERY ; LSNRAPPLIESTO=SR ; TICKETID=1002 ; LSNRRESULTCOLUMNS=TICKETID,DESCRIPTION, REPORTEDBY,COMMODITYGROUP ; #MAXIMO_EMAIL_END </pre>
Query multiple records and return selected columns	<pre> #MAXIMO_EMAIL_BEGIN LSNRACTION=QUERY ; LSNRAPPLIESTO=SR ; LSNRRESULTCOLUMNS=TICKETID,DESCRIPTION, REPORTEDBY,INTERNALPRIORITY ,REPORTDATE ; LSNRWHERECONDITION=STATUS ='CLOSED' ; #MAXIMO_EMAIL_END </pre>
Query multiple records and return all columns	<pre> #MAXIMO_EMAIL_BEGIN LSNRACTION=QUERY ; LSNRAPPLIESTO=INCIDENT ; LSNRRESULTCOLUMNS=* ; LSNRWHERECONDITION=REPORTEDBY='LIBERI' ; #MAXIMO_EMAIL_END </pre>
XML query function	
Query a single record with criteria (LSNRWHERECONDITION tag)	<pre> &lt;MAXIMOEMAILCONTENT&gt; &lt;LSNRACTION&gt;QUERY&lt;/LSNRACTION&gt; &lt;LSNRAPPLIESTO&gt;PROBLEM&lt;/LSNRAPPLIESTO&gt; &lt;LSNRRESULTCOLUMNS&gt;ticketid,description, reportedby,affectedperson,commoditygroup &lt;/LSNRRESULTCOLUMNS&gt; &lt;LSNRWHERECONDITION&gt;ticketid in ('1001') &lt;LSNRWHERECONDITION&gt; &lt;/MAXIMOEMAILCONTENT&gt; </pre>

Description	Example
Query without criteria	<pre> &lt;MAXIMOEMAILCONTENT&gt; &lt;LSNRACTION&gt;QUERY&lt;/LSNRACTION&gt; &lt;LSNRAPPLIESTO&gt;PROBLEM&lt;/LSNRAPPLIESTO&gt; &lt;TICKETID&gt;1003&lt;/TICKETID&gt; &lt;LSNRRESULTCOLUMNS&gt;ticketid,description, reportedby,affectedperson,commoditygroup &lt;/LSNRRESULTCOLUMNS&gt; &lt;/MAXIMOEMAILCONTENT&gt; </pre>
Query multiple records and return selected columns	<pre> &lt;MAXIMOEMAILCONTENT&gt; &lt;LSNRACTION&gt;QUERY&lt;/LSNRACTION&gt; &lt;LSNRAPPLIESTO&gt;PROBLEM&lt;/LSNRAPPLIESTO&gt; &lt;LSNRRESULTCOLUMNS&gt;ticketid,description, reportedby,affectedperson,commoditygroup &lt;/LSNRRESULTCOLUMNS&gt; &lt;LSNRWHERECONDITION&gt;AFFECTEDPERSON = 'RAMSDALE' AND STATUS = 'QUEUED' &lt;/LSNRWHERECONDITION&gt; &lt;/MAXIMOEMAILCONTENT&gt; </pre>
Query multiple records and return all columns	<pre> &lt;MAXIMOEMAILCONTENT&gt; &lt;LSNRACTION&gt;QUERY&lt;/LSNRACTION&gt; &lt;LSNRAPPLIESTO&gt;INCIDENT&lt;/LSNRAPPLIESTO&gt; &lt;LSNRRESULTCOLUMNS&gt;*&lt;/LSNRRESULTCOLUMNS&gt; &lt;LSNRWHERECONDITION&gt;AFFECTEDPERSON = 'SMITH' AND STATUS = 'QUEUED' &lt;/LSNRWHERECONDITION&gt; &lt;/MAXIMOEMAILCONTENT&gt; </pre>

## Working with E-mail Listeners

You use e-mail listeners to receive and process incoming e-mail messages. The E-mail Listeners application can monitor multiple e-mail accounts to retrieve messages. It also supports embedded and normal message attachments.

- [Purging e-mail records from the staging table](#)  
As your business needs change, you can purge staging records. If errors are found during the staging process, you can deactivate the listener, purge the staging records, and reactivate the listener to remove the error.
- [Customizing the e-mail listener preprocessor](#)  
You can customize the e-mail listener preprocessor to suit your business needs. The preprocessor determines whether incoming e-mail messages are new requests for help or are updates to existing service requests.
- [Changing the object key delimiter](#)  
The object key delimiter value identifies an incoming e-mail as an existing ticket. You can select other characters to represent the object key delimiter other than the default (##).
- [Working with e-mail listeners definitions](#)  
The E-mail Listeners application uses definitions to poll the mail server for incoming messages and to send e-mail messages in response. The response e-mail messages confirm that a desired operation was performed on behalf of the user.
- [Activating workflow processes for e-mail listeners](#)  
You configure Java™ Messaging Service (JMS) queues to manage high volumes of e-mail messages that must be processed quickly. Activating the e-mail listener workflow process to use an e-mail listener as a JMS queue is part of configuring JMS queues for e-mail listeners.
- [Creating communications for e-mail messages](#)  
You can create communications that pertain to e-mail records. The communication that you create is sent as an e-mail notification to the recipients that you choose.

## Purging e-mail records from the staging table

As your business needs change, you can purge staging records. If errors are found during the staging process, you can deactivate the listener, purge the staging records, and reactivate the listener to remove the error.

### Before you begin

Before you can purge e-mail records from the staging table, you must deactivate the associated e-mail listener definition.

### Procedure

1. In the E-mail Listeners definition, select the e-mail listener for which you want to purge e-mail records.
2. Click the E-mail Processing tab to view the e-mail records, and select the Activate/Deactivate Listener action.
3. Save your changes to deactivate the e-mail listener.
4. Select the Purge Staging Records action.
5. Click Yes to confirm the deletion of the e-mail records.
6. Select the Activate/Deactivate Listener action to reactivate the e-mail listener.
7. Save your changes.

### Example

If you change your mail server implementation or the e-mail address of an e-mail account, you can purge the staging records associated with each account. Alternatively, after initial testing of the application and configurations, you can purge the staging table of any e-mail records before you enable e-mail listener functionality in a production environment.

---

## Customizing the e-mail listener preprocessor

You can customize the e-mail listener preprocessor to suit your business needs. The preprocessor determines whether incoming e-mail messages are new requests for help or are updates to existing service requests.

### About this task

Java™ requires that you declare the custom implementation at the beginning of the file. For example: `public class MyPreprocessor implements LSNRPreprocessor`.

### Procedure

1. Place the Java class source file in the appropriate Java package where you manage custom Java code.
2. Build your custom Java code into corresponding class files.
3. Build the Enterprise Archive (EAR).
4. Deploy the EAR into the application server to have your code changes take effect.

---

## Changing the object key delimiter

The object key delimiter value identifies an incoming e-mail as an existing ticket. You can select other characters to represent the object key delimiter other than the default (##).

### About this task

The ID of the record is called the object key identifier. The object key identifier can be a sequence that the system generates. For example, 1001, 1002, and so on.

### Procedure

1. Replace the value with other characters.  
There are no restrictions. However the delimiter must be unique. Choose infrequently used characters or symbols for delimiters.
2. Place the delimiter before and after the ticket ID (example: SR 1009 is represented as ##1009##).

### Example

If + is the delimiter, a user could send an e-mail with the subject line: **+1003+ Having problems with printer + network**.

The base preprocessor cannot identify the substring because the delimiter symbol occurs multiple times within the subject line. In these circumstances, you must develop your own preprocessor that contains logic to recognize the new delimiter used with e-mails in your business environment.

---

## Working with e-mail listeners definitions

The E-mail Listeners application uses definitions to poll the mail server for incoming messages and to send e-mail messages in response. The response e-mail messages confirm that a desired operation was performed on behalf of the user.

- [Creating e-mail listener definitions](#)  
When you create an e-mail listener definition, the mail server polls the account that you specify in the e-mail listener definition for incoming e-mail messages. These e-mail messages are processed according to their content.
- [Deleting e-mail listener definitions](#)  
You can delete e-mail listener definitions to help simplify e-mail management.

---

## Creating e-mail listener definitions

When you create an e-mail listener definition, the mail server polls the account that you specify in the e-mail listener definition for incoming e-mail messages. These e-mail messages are processed according to their content.

### Procedure

1. In the E-mail Listener application, click New Listener Definition.

2. Specify a value for the e-mail address.
3. Optional: Provide a description of the e-mail address.
4. Specify values for the e-mail password, the mail server, the e-mail folder on the mail server that will contain the e-mail messages, and the mail protocol used with the mail server.  
The port value is provided based on the protocol value. You can change the port value, if necessary.
5. Specify a value for the workflow process to use for the definition.
6. Specify a value for the schedule to set how often you want the server to be polled for incoming e-mail messages. The default frequency is every five minutes. The default values for preprocessor, object key delimiter, cron task name, and cron task instance are provided.
7. Optional: Complete the following steps:
  - To have e-mail messages deleted from the server after they are processed, select the E-mail Deleted option.
  - Specify a value for the Age Threshold field for the length of time that an e-mail message remains on the mail server before being deleted.
  - Specify a value for the age unit of measure.
  - If you configured a Java™ Messaging Service (JMS) queue to facilitate processing of e-mail messages, select the Queue Based Processing check box.
  - If necessary for your configuration, specify a value for the queue connection factory. Specify a value that represents the Java Name and Directory Interface (JNDI) name of the Java component that provides a connection to a queue.
  - If necessary for your configuration, specify a value for the processing queue. Specify a value that represents the name of the queue that is to be used to process e-mail messages for this account.
8. Save the e-mail listener definition.

---

## What to do next

You must activate the e-mail listener definition for incoming e-mail messages to be polled on the mail server. To activate the e-mail listener definition, use the Activate/Deactivate Listener action.

---

## Deleting e-mail listener definitions

You can delete e-mail listener definitions to help simplify e-mail management.

---

## Before you begin

Before you delete an e-mail listener definition, purge the e-mail records from the staging table for that account.

---

## About this task

You can delete e-mail listener definitions with a status of incomplete, invalid, or error. When you delete an e-mail listener definition, the cron task instance associated with that definition is also deleted.

---

## Procedure

1. In the E-mail Listeners application, select the e-mail listener definition that you want to delete.
2. Select the Activate/Deactivate Listener action.
3. Save the configuration.  
The e-mail listener definition is deactivated.
4. Select the Delete Listener action.
5. Save the configuration.  
The e-mail listener definition and the associated cron task instance are deleted.

---

## Activating workflow processes for e-mail listeners

You configure Java™ Messaging Service (JMS) queues to manage high volumes of e-mail messages that must be processed quickly. Activating the e-mail listener workflow process to use an e-mail listener as a JMS queue is part of configuring JMS queues for e-mail listeners.

---

## Procedure

1. In the Workflow Designer application, select the LSNRBP workflow process.
2. Select the Enable Process action to validate and enable the workflow process.
3. Select the Activate Process action.
4. Select the IBEP workflow process.
5. Select the Enable Process action to validate and enable the workflow process.
6. Select the Activate Process action.

---

## What to do next

After you activate the workflow process for the e-mail listener, you can configure the e-mail listener to use as a JMS queue.

- [Configuring e-mail listeners to use Java Messaging Service queues](#)  
To use an email listener as a Java Messaging Service (JMS) queue, you must configure the email listener. You configure JMS queues to manage high volumes

of email messages that must be processed quickly.

## Configuring e-mail listeners to use Java Messaging Service queues

To use an email listener as a Java™ Messaging Service (JMS) queue, you must configure the email listener. You configure JMS queues to manage high volumes of email messages that must be processed quickly.

### Procedure

1. In the E-mail Listeners application, create an email listener definition.
2. On the Listener tab, provide the necessary information, including email address, email password, mail server, protocol, email folder, preprocessor, object key delimiter, workflow process, and schedule.
3. In the E-mail Processing Frequency section, select the queue-based processing option.
4. Specify `jms/maximo/lsnr/lsnrqcf` as the value for the queue connection factory.
5. Specify `jms/maximo/lsnr/qin` as the value for the processing queue.
6. Select the Security Settings action.
7. In the Select Security Settings window, click New Row and specify the following information:
  - a. Specify SR as the value for the Maximo® business object.
  - b. Specify CREATESR as the value for the Maximo application.

Note: Secured images that are embedded in the email body gets added as an attachment in the service request created by email listener.
8. Click OK.
9. Select the Activate/Deactivate Listener action.

## Creating communications for e-mail messages

You can create communications that pertain to e-mail records. The communication that you create is sent as an e-mail notification to the recipients that you choose.

### Procedure

1. On the E-mail Processing tab in the E-mail Listeners application, select the e-mail record for which you want to create a communication.
2. Click Create Communication to open the Create Communication window.

Based on the e-mail record that you selected, the default values for the recipient, the subject, and the message are provided. You can change these values.
3. Add an attached file.
4. Send the communication to the recipient that you specified.

## Database Information

The Database Information application provides information and access for database objects and attributes. You can make limited changes to data structures, such as associating a domain with an attribute, making an attribute required, or changing the search type.

You configure changes in the application in the nonproduction environment. Apply the changes or configure changes in Admin mode. The following table contains information about the differences between applying changes and configuring with Admin mode:

Table 1. Configuration options

Option	Description	Actions
Apply Changes	Full live configuration. Use only when few users are logged in and no transactions are expected.	Applies changes without logging users out of the system. Cache is deleted and re-created, so if transactions occur while the cache is being changed, the transactions can be lost.
Manage Admin Mode	Allows you to turn on Admin mode and specify a number of minutes after which users are logged out. In Admin mode, partial live configuration is turned on. No transactions can occur during Admin mode. To receive email reports, set the mail.smtp.host property. When configuration is complete, turn off Admin mode.	Logs users out of the system with exception of the administrator with permission to log in during Admin mode. Suspends cron tasks and disables event listeners. If an affected table cannot be changed with data in it, table data is backed up first.

After you configure your changes, you export the updated configuration to a .json file with the Application Export action. Then import that file to your production environment with the Application Import action in that environment.

When you import changed files from the nonproduction to the production environment, be aware of data dependencies. Import data in order of fewest dependencies first. For example, if you were to add a domain, associate the domain with an extra field, and then add the extra field to a presentation, you import the exported files in this order:

1. .json file for the domain change
2. .json file for the database information change
3. .xml file for the application presentation

---

## Web Services Library

You can use the Web Services Library application to create and deploy web services for all service types, object structure, enterprise, and standard services. By deploying web services, external applications can make SOAP-based calls to retrieve or update business object data. The application generates the XML schema and Web Services Description Language (WSDL) files for all of your web services.

---

## Launch in Context

You use the Launch in Context application to create and modify launch entry records which open an external application in the same or a different browser session. You can open applications independently or as part of an application integration scenario.

The launch entry record can utilize the following options in the Application Designer to open an external application:

- Select action menu items
- Hyperlinks
- Buttons

You use the Launch in Context application to create and update launch entries. A launch entry defines a URL that opens a console for an external application. The launch entry can pass data, referred to as context, from the application to the external console. You can configure a console URL for any application with a web-based console. Additionally, you can configure console URLs for consoles that use Java™ Web Start. You cannot use a launch entry to open applications that are not enabled for the web. You can configure a launch point from any application.

---

## Automation Scripts

With the Automation Scripts application, you can create scripts to automate tasks that are based on the events or attributes of a business object, or based on actions or custom conditions. You can create a script in any of several supported scripting languages, and run the script without having to recompile Java™ files or restart the server.

---

## Migration

You use the applications in the Migration module (within the System Configuration module) to migrate configuration content from one environment to another.

- [Object structures](#)  
An object structure is the common data layer that the integration framework components use for outbound and inbound application message processing. An object structure consists of one or more related business objects that define the content of an XML or JSON message (schema).

---

## Object structures

An object structure is the common data layer that the integration framework components use for outbound and inbound application message processing. An object structure consists of one or more related business objects that define the content of an XML or JSON message (schema).

An object structure provides the message content for channels and services and enables application-based import and export. In addition, an object structure, on its own, can be called as a service, supporting the Create, Update, Delete, Sync, and Query operations.

Note: Use the object structures that are provided with your Manage system whenever possible, instead of creating a new or duplicate object structure. If the outbound integration messages are in the JSON format, you can modify which data is shared from that object structure by creating a message template for the object structure.

- [Identification of object structure data](#)  
If you are adding or modifying object structures, identification of the data to include requires some understanding of the applications and their associated objects. Review the data model of an application to determine which objects, database tables, and views contain the data to transfer to and from an external system.
- [Alternate keys](#)  
Inbound message processing relies on the key field(s) of an object to find an existing record in the system to support updates and deletes. The default processing relies on the primary key to retrieve existing records. Sometimes a primary key is unknown to an external application and an alternate key (known by the external system) is defined to support the updating and deleting of records by the external system.
- [Object fields](#)  
The integration framework and the external system exchange a subset of the data columns in the objects within the object structure. Subject to certain restrictions, you can control the content of the object fields within the message by including persistent and nonpersistent columns of individual objects.
- [Interface table and flat file considerations](#)  
If you use an object structure for exchanging data with interface tables or flat files, you must ensure that the object structure does not contain duplicate column names.
- [Modification of a predefined object structure](#)  
There are certain restrictions if you modify a predefined object structure.

- [Configuring an object structure](#)

You can create new object structures and during that process you can generate schema files, include or exclude fields, and resolve alias conflicts. You can also specify inbound setting restrictions, set advanced configuration properties, configure application authorization, and configure message templates for outbound integration messages.

- [Message templates that specify outbound data](#)

Message templates are an additional option for editing the structure of an outbound message. You use message templates to limit which data from the associated object structure is included in the message.

---

## Task Management module

The Task Management module contains the Activities and Tasks application, which you use to plan, review, and manage activities and tasks. When you create an activity, you initiate the work process and create a historical record of work being performed.

See the help topics for the application for more information.

- [Activities and Tasks](#)

You use the Activities and Tasks application to plan, to review, and to manage activities and tasks. An activity initiates the work process and creates a historical record of the work being performed. Activities are created in the Incidents and Problems applications. A task is a specific unit of work on a work order.

---

## Activities and Tasks

You use the Activities and Tasks application to plan, to review, and to manage activities and tasks. An activity initiates the work process and creates a historical record of the work being performed. Activities are created in the Incidents and Problems applications. A task is a specific unit of work on a work order.

An activity is a type of work order. A task can be created as part of an activity or part of another work order.

You can use the Activities and Tasks application to perform the following functions:

- Change the status of activities and tasks
- Take ownership of activities or tasks
- Assign ownership of activities and tasks to individuals or to workgroups
- Modify activities and tasks to reflect changes
- View related preventive maintenance and scheduling information
- Categorize the activities and tasks using classifications and attributes to simplify their management and retrieval
- Specify, view, and modify job tasks and the labor, material, services, and tool requirements for work plans
- View, add, and delete work orders and tickets that are related to an activity or to a task
- View follow-up records for an activity or a task
- View and create a work log and communication entries about a record

- [Activities and tasks overview](#)

An activity specifies the tasks, and the labor, materials, services, and tools needed to complete the task. Activities are created to document the required work, which can then be delegated to the individuals responsible for completing the work.

- [Working with activities](#)

Activities are created in the Incidents and Problems applications. Tasks are created as part of activities and other work orders. You can manage and modify activities and tasks in the Activities and Tasks application. For example, you can change the ownership or status of an activity or task.

---

## Activities and tasks overview

An activity specifies the tasks, and the labor, materials, services, and tools needed to complete the task. Activities are created to document the required work, which can then be delegated to the individuals responsible for completing the work.

- [Record ownership](#)

The owner of a record is the person or person group that is in charge of the record from an administrative perspective.

- [Activity statuses](#)

The status of an activity indicates its position in the processing cycle. The status determines which actions can be performed on the activity. For example, if the activity is approved (APPR), then the tasks can start.

- [Measurement points](#)

When you inspect an asset or a location, you can record and view the meter readings that correspond to measurement points in the job plan of the associated work order. You can also insert measurement points on an activity until the activity or task is closed.

- [Service level agreements](#)

A service level agreement (SLA) typically is a written agreement that outlines the commitment between a service provider and its customers. A commitment is a service level that all parties have agreed to, such as asset reliability or availability.

- [Record relationships](#)

Relationships between records, such as tickets and work orders, help simplify record management. You can create record relationships manually, or relationships might be created automatically when you take certain actions.

- [Costs on tickets and work orders](#)

You can view the estimated and actual costs for a single work order or ticket, including costs for labor, material, tools, and services. You can also view total costs for the current record and all the records below it in its hierarchy.

- [Work plan removal](#)  
Under certain circumstances, you can remove a work plan from an activity by using the Remove Work Plan action.
- [Deletion rules for activities](#)  
For auditing purposes, you cannot always delete activities. If you cannot delete a specific activity, you can stop all action on an activity by changing the status to canceled.
- [Rules for modifying archived activities](#)  
Closed and canceled activities are archived, and become historical records. You might be able to add additional information to a historical record by using the Edit History Activity action.

---

## Record ownership

The owner of a record is the person or person group that is in charge of the record from an administrative perspective.

The owner of a record keeps the customer updated and acts as the point person for any issues involving the work. You can use the Select Owner action to assign record ownership to a person or person group, or you can use the Take Ownership action if you want to take administrative ownership of the record yourself. You can take ownership for more than one application.

Keep in mind the following points regarding record ownership:

- A record can have many different owners during its life cycle.
- You can select an owner or owner group until the record's status is CLOSED.
- To view the ownership history of a record, select View History.
- A workflow or an escalation process may assign ownership, if appropriate.

If the Persons tab on your Select Owner dialog box displays a Person Group field and a Date field, then you can filter the list of persons by the values in these fields. For example, suppose the Person Group field and the Date fields are empty when you open the dialog box. You specify a person group and a date and time, and click Refresh. The system displays only the persons in the specified group who are available on the specified day and time.

---

## Activity statuses

The status of an activity indicates its position in the processing cycle. The status determines which actions can be performed on the activity. For example, if the activity is approved (APPR), then the tasks can start.

When you change the status of an activity, the status of any applicable child activity that uses the inherit status option also changes. If you change the status of global activities, the same status change is automatically applied to all globally related records. In addition, the status of an activity can be automatically changed. For example, after you assign an owner to an activity, the status of that activity automatically changes to queued.

A follow-up record can change the status of the originating activity, which results in automatic routing or notification of the status change.

### WAPPR

The activity is waiting for approval. WAPPR is the default status for records created in the Work Order Tracking, Changes, Releases, and Activities and Tasks applications.

### APPR

The activity is approved and the work can begin. Work plan items on an approved activity are reserved in inventory, and cost and rate data are recorded. Rates can be changed in the Inventory application, Labor application, or Tools application. If the rates are changed in any application, the work plan reflects the rates in effect when the activity was approved.

### WSCH

The activity is waiting to be scheduled. WSCH is the default status for records created in the Preventive Maintenance application.

### WMATL

Materials must arrive before the work can be performed.

### WPCOND

The work can be performed only when the condition of the plant is suitable. For example, certain work might require the shutdown of the plant.

### INPRG

The work is in progress. INPRG is the default status for records created in the Quick Reporting application.

### COMP

The physical work is completed. If you want to move or change an asset on an activity, the move or change occurs when the status is changed to complete.

### CLOSE

The activity is finalized. Inventory reservations for items not used in the activity are removed and the activity is made into a history record.

### CAN

The work is canceled. You cannot cancel an activity if the work has already been initiated or if actuals have already been reported. You can use this status when you want to delete an activity and deleting is not allowed.

---

## Measurement points

When you inspect an asset or a location, you can record and view the meter readings that correspond to measurement points in the job plan of the associated work order. You can also insert measurement points on an activity until the activity or task is closed.

The product copies the measurement point number to the job plan when there is a three-way match between the following items:

- The measurement point name on the job plan listed on the activity.
- The measurement point name on the asset or the location listed on the activity.
- A measurement point number for the measurement point name.

If you specify a measurement for a measurement point, the measurement and measurement date are added to the Measurements table. If you specify a measurement without a measurement point, the measurement data is saved with the activity.

You use the Observation field to record visual inspection data. You use the Inspector field to record the name of the person performing the inspection. You can edit these fields until the activity is closed. Once the activity is closed, you can add or modify operations by selecting the Edit History Activity action.

---

## Service level agreements

A service level agreement (SLA) typically is a written agreement that outlines the commitment between a service provider and its customers. A commitment is a service level that all parties have agreed to, such as asset reliability or availability.

The SLA describes one or more commitments and the escalation actions or notifications associated with each commitment. Escalation actions or notifications might be associated with an SLA to ensure that commitments are met. An escalation process can monitor all activities and send notifications or perform other activities to ensure that commitments are met.

The types of records to which service level agreements can be applied include tickets, such as service requests, and work-based records, such as work orders. Before you can apply an SLA to a record, the record must have a site defined.

A service level agreement can be associated with a record in several ways:

- An SLA might automatically be applied to a record from within a workflow or escalation process, or from another SLA.
- You can select an action to apply an SLA, which applies the best match automatically.
- You can view SLAs and select an action to select or clear the SLAs that you want to manually apply to the record.

When you apply a service level agreement to a record, the following events occur:

- The SLA Applied check box on the main tab of the record is selected to document the action.
- Any escalations that are associated with the SLA are activated.
- The Target Start, Target Finish, and Contact values for the record might be calculated automatically as follows:

Automatically calculated values
When an SLA is applied that includes a response commitment, the response commitment date populates the Target Start date field of the record.
When an SLA is applied that includes a resolution commitment, the resolution commitment date populates the Target Finish date field of the record.
When an SLA is applied that includes a contact commitment, the contact commitment date populates the Target Contact date field of the record.

---

## Record relationships

Relationships between records, such as tickets and work orders, help simplify record management. You can create record relationships manually, or relationships might be created automatically when you take certain actions.

The types of relationships that can exist between records include:

- Related relationship, which is an informal association of tickets that is used for informational purposes.
- Originator and Follow-up, which keep costs hierarchies separate while still creating a relationship between the tickets.
- Related to Global, which creates a relationship in which the tickets are related to a global issue, which affects many users.

---

## Related records

Using any ticket or work-based application, you can view similar records and relate tickets and work orders to the current record. A related relationship between records is an informal relationship that is for informational purposes only.

A related relationship does not affect status inheritance, affect workflow, or follow a set of business rules. Related relationships can be many-to-many, and do not represent record hierarchies. By relating records informally, you can navigate to related records, view related information for similar records, and view open tickets that are associated with a field. You can create an informal record relationship in the following ways:

- Use the Related Records tab of the application. This tab provides an easy way to create relationships and to view and navigate among informally related records.
- Use the Show Similar Tickets action in any ticket application. The similar ticket search results only include the service requests, incidents, and problems that have the same classification as the current ticket. Global records and history records are not included in the results. Your system administrator might add more restrictions to the search results.

---

## Originator and follow-up tickets and work orders

You can relate tickets and work orders to a record more directly when you create a follow-up record from the ticket using one of the Create actions on the ticket. The ticket you create the follow-up record from is the originator. A follow-up record can be a ticket or a work order. In some cases, a follow-up ticket or work order might be able to change the status of its originating ticket. An originating ticket cannot change the status of a follow-up work order, nor can a follow-up ticket change the status of the originator if there is more than one follow-up. These options are configured by the system administrator.

## Globally related tickets

A global ticket is an incident or problem relating to an issue that affects many users. You can relate tickets, including service requests, to a global ticket, which creates a RELATEDTOGLOBAL relationship. This relationship lets you manage the tickets by using the global ticket. When you change the status of the global ticket, the system changes the status of all globally related tickets.

If your administrator has set up automated notifications of status changes, the system changes the status of the tickets related to the global issue. For example, all the initial requestors reporting the same issue are notified of its resolution. On the global ticket, you can also view a list of related records and view the work and communication logs for all related records.

- **Deletion of record relationships**

On the Related Records tab, you can delete the relationship between a change and any related work orders or tickets.

- **Global records**

A global record is a ticket that is a root cause of other issues or that affects many users, such as computer network failures or flooding in a building. After you mark a record as global, you can relate multiple tickets and then manage all tickets using the global record.

## Costs on tickets and work orders

You can view the estimated and actual costs for a single work order or ticket, including costs for labor, material, tools, and services. You can also view total costs for the current record and all the records below it in its hierarchy.

When you view the costs of a ticket or work order, the data is displayed in two tables:

- The Totals table displays the costs for a single ticket or work order.
- The View Hierarchy Grand Totals table displays the costs for the current ticket or work order and all records under its hierarchy.

Each table presents the same information, which is shown in the following table.

Column	Explanation
Current Estimate	Displays read-only calculated values for the current totals from the Labor, Materials, Standard Services, and Tools tabs of the Plans tab for the ticket or work order.
Estimate at Approval	Is set to zero until the work order is approved, then the values are copied from the Current Estimate column and are read-only. If the work order status changes from approved to unapproved, then these fields are cleared. The estimated costs at approval are not affected by the change in status from in progress to completed or closed.
Actual	Displays the read-only values from the Labor (for approved labor only), Materials, and Tools tabs of the Actuals tab. If the status of the record changes from approved, then these fields are not cleared.

## Rolling up maintenance costs

After you close a work order that is associated with an asset, you can calculate your maintenance costs by rolling up costs that you incur for labor, materials, tools, and services to the top-level asset in the hierarchy that the asset belongs to.

Costs can be rolled up manually or automatically. By default, cost rollups are manual. If you want costs to be calculated and rolled up automatically when a work order is closed, you must set the `mxe.workorder.rollupMaintenanceCosts` system property to 1. After you configure the system property for automatic rollups, all subsequent costs that are associated with work orders are rolled up automatically. However, any unprocessed maintenance costs that existed before the configuration are not automatically rolled up. You must roll up any preexisting, unprocessed maintenance costs manually.

To calculate the maintenance cost of your assets, use the Roll Up Maintenance Costs action in the Assets application.

If you upgrade to Maximo® Manage 8.5, run the Asset Cost Rollup Report to roll up pending maintenance costs before the upgrade.

## Work plan removal

Under certain circumstances, you can remove a work plan from an activity by using the Remove Work Plan action.

When you remove a work plan, all information in the Resources tab, except for non-task children, is removed. Also, if the work plan has a job plan, the job plan identifier is removed.

If any task in the work plan cannot be removed based on the deletion rules for changes, you cannot use the Remove Work Plan action. You can still delete labor, material, services, and tools information, as well as any tasks that do meet the deletion rules.

## Deletion rules for activities

For auditing purposes, you cannot always delete activities. If you cannot delete a specific activity, you can stop all action on an activity by changing the status to canceled.

The activity and its children must meet the following criteria to be deleted:

- Have a status of waiting for approval
- Not have any transactions registered against it, except for status changes

- Not have any actuals reported against it
- Not have any labor assignments associated with it
- Not have been generated for a purchase order or receipt
- It must not have any failures reported against it.
- Not be in a workflow or have ever been in a workflow
- Not have any measurements or meter readings taken against it
- Cannot be or have follow-up work

To delete an activity, use the Delete,  Activity action.

---

## Rules for modifying archived activities

Closed and canceled activities are archived, and become historical records. You might be able to add additional information to a historical record by using the Edit History Activity action.

When you modify an archived activity, the following rules apply:

- New costs that were incurred during the edit history must be added to the inventory cost, if it is defined as charge to store.
- You can add actual labor, but you cannot change approved transactions.
- You can add actual materials and actual tools, but you cannot change them.
- You can add or delete child records, whether or not the child records are tasks.
- You can attach documents.
- You cannot change planned labor, materials, and tools.
- You cannot change information in the following fields:
  - Asset.
  - Location.
  - GL Account.
  - Charge to Store.
  - Status.
  - Status Date

---

## Working with activities

Activities are created in the Incidents and Problems applications. Tasks are created as part of activities and other work orders. You can manage and modify activities and tasks in the Activities and Tasks application. For example, you can change the ownership or status of an activity or task.

- **[Planning activities and tasks](#)**  
After you associate a task with an activity, you can specify estimates for labor, craft, materials, services, and tools for each task on the activity or for the activity as a whole.
- **[Reporting actuals for activities and tasks](#)**  
As work progresses on an approved activity or task, you can report the actual labor hours, materials, services, and tools used.
- **[Applying service level agreements to records](#)**  
You can apply a service level agreement (SLA) to a record to define the agreement and formal commitments between a service provider and a customer. The agreement documents the service to be provided or received, the agreed upon service levels for the service, and the means of measuring or quantifying the level of service.
- **[Swapping assets](#)**  
You can swap assets associated with a work order. The swap action applies to the work order and all of the assets, locations, and configuration items on its child work orders. The term "work order" can refer to a work order, change, release, or activity record.
- **[Relating work orders or tickets to activities or to tasks](#)**  
You can link work orders and tickets to an activity or task. When you link a record to a work order, its relationship type is RELATED.
- **[Classifying activity records](#)**  
To simplify the process of finding and managing activity records, you can classify the records. Categorizing an activity involves classifying it and adding and modifying attributes to further group the classification.
- **[Setting up work process flows](#)**  
Work process flows use relationships between work orders and tasks to automate the flow of status changes. You set relationships between work orders and tasks so that when a task is completed, the next task in the flow can be initiated.
- **[Changing the status of activities or tasks](#)**  
You can change the status of an activity to indicate the position of the activity as it moves toward completion.

---

## Planning activities and tasks

After you associate a task with an activity, you can specify estimates for labor, craft, materials, services, and tools for each task on the activity or for the activity as a whole.

- **[Creating work plans](#)**  
A work plan describes the labor, materials, tools, services, and tasks you need to complete an activity or task. You can create a work plan manually.
- **[Planning work for activities and tasks](#)**  
You use the Activities and Tasks application to insert, view, or edit planned labor information or planned craft information.
- **[Creating tasks for activities](#)**  
You use the Activities and Task application to create additional tasks or to edit the existing tasks for an activity. After you create a task, you can plan its labor,

materials, services, and tools.

---

## Creating work plans

A work plan describes the labor, materials, tools, services, and tasks you need to complete an activity or task. You can create a work plan manually.

### Procedure

---

1. In the Activities and Tasks application, display the record for which you want to create a plan.
2. Make one of the following selections:

Option	Description
<b>If the record is an activity</b>	Click the Plans tab.
<b>If the record is a task</b>	Click the Resources tab, then click the Plans sub tab.

3. Specify work plan data, such as tasks, labor, materials, tools, and services using the sub tabs.
4. Save the record.

- [Creating work plans using job plans](#)

A work plan describes the labor, materials, tools, services, and tasks you need to complete an activity. You can select a job plan, and modify it to your needs.

---

## Creating work plans using job plans

A work plan describes the labor, materials, tools, services, and tasks you need to complete an activity. You can select a job plan, and modify it to your needs.

### Procedure

---

1. In the Activities and Tasks application, display the record for which you want to create a work plan from a job plan.
2. Make one of the following selections:

Option	Description
<b>If the record is an activity</b>	Click the Plans tab.
<b>If the record is a task</b>	Click the Resources tab, then click the Plans sub tab.

3. In the Job Plan field, click Detail Menu and select an option to retrieve a value. When you associate a job plan with a work order, the product copies the labor, the materials, the services, and the tools to the work order plan. If the job plan has a default safety plan for the selected work asset, the product also copies the safety plan to the work order.
4. Optional: Edit the fields to modify any of the information. Changes you make to the work plan do not affect the original job plan.
5. Save the record.

---

## Planning work for activities and tasks

You use the Activities and Tasks application to insert, view, or edit planned labor information or planned craft information.

### Procedure

---

1. Display the activity or task for which you want to plan labor.
2. Make one of the following selections:

Option	Description
<b>If the record is an activity</b>	Click the Plans tab.
<b>If the record is a task</b>	Click the Resources tab, then click the Plans sub tab.

3. Enter the details of the planned work on the following subtabs:

Option	Description
<b>Labor</b>	Add hours for labor or select crafts.
<b>Materials</b>	Add materials, search catalogs, or add spare parts.
<b>Services</b>	Add services.
<b>Tools</b>	Add tools.

4. Save the record.

---

## Creating tasks for activities

You use the Activities and Task application to create additional tasks or to edit the existing tasks for an activity. After you create a task, you can plan its labor, materials, services, and tools.

## Procedure

1. Display the activity for which you want to create planned tasks.
2. In the Tasks table window on the Plans tab, click New Row.
3. Specify a unique value in the Task field.
4. To have the tasks performed in a specific order, enter the appropriate value in the Sequence field.
5. Type the amount of time needed to complete the task in the Estimated Duration field.
6. Use the Labor, Materials, Services, and Tools subtabs to plan for the task.
7. Save the activity.

## Reporting actuals for activities and tasks

As work progresses on an approved activity or task, you can report the actual labor hours, materials, services, and tools used.

## Procedure

1. Display the activity or task for which you want to report actuals.
2. Make one of the following selections:

Option	Description
<b>If the record is an activity</b>	Click the Plans tab.
<b>If the record is a task</b>	Click the Resources tab, then click the Plans sub tab.

3. Enter the details for the actuals on the following subtabs:

Option	Description
<b>Labor</b>	Report hours for labor, copy labor from the work plan, or select planned labor.
<b>Materials</b>	Select materials, select reserved items, and select spare parts.
<b>Services</b>	Select services or standard services.
<b>Tools</b>	Select tools, copy tool data from the work plan, or select tools that were issued.

4. Save the record.

## Applying service level agreements to records

You can apply a service level agreement (SLA) to a record to define the agreement and formal commitments between a service provider and a customer. The agreement documents the service to be provided or received, the agreed upon service levels for the service, and the means of measuring or quantifying the level of service.

## About this task

When you apply an service level agreement to work orders, the SLA is applied only to the work order, not to its tasks. If you want to apply a service level agreement to a task, you must display the task as the current record and then apply the SLA.

You can apply service level agreements to tickets and work orders.

## Procedure

1. Open an application and display the record that you want to update.
2. Select the Apply SLA action.
3. Click OK.

## Results

The SLA Applied check box on the main tab of the selected application is selected. The target start, target finish, and contact values are calculated for the selected record.

## Removing service level agreements from records

To maintain accurate records, it might be necessary to remove an invalid or erroneous service level agreement to disassociate it from the record.

## Procedure

1. Display the record for which you want to remove a service level agreement.
2. Select the Select/Deselect SLA action.
3. Click Mark Row for Delete for each service level agreement that you want to remove from the record.
4. Click OK.

5. Save the record.

---

## Swapping assets

You can swap assets associated with a work order. The swap action applies to the work order and all of the assets, locations, and configuration items on its child work orders. The term "work order" can refer to a work order, change, release, or activity record.

---

### Before you begin

You can execute the swap immediately, or you can save the swap as a plan. If you save the swap as a plan, the changes will apply when the status for the work order is COMP (Complete). When the status of a work order is COMP, you swap assets only using the Execute Now option. When you select Execute Now on any tab, the system executes the changes on all tabs.

When you duplicate a work order that has a planned swap to its assets or locations, the planned action does not get copied to the duplicate work order. Also, when you create a release, or change, or work order from a record using the Select Action menu option, the planned action is not copied to the follow-up record.

---

### Procedure

1. Select the Move/Swap/Modify action.
2. Click the Move/Swap tab.
3. Select the Is this an Asset Swap checkbox.
4. In the Swap Assets section, select the row for the asset you want to swap.
5. To move the asset to a parent or location, type a value in the appropriate field, or click Select Value to retrieve a value.
6. In the Replacement Asset field, specify an asset, or click Select Value to retrieve a value.
7. Perform one of the following actions:
  - To swap the assets immediately, click Execute Now.
  - To swap the assets when the status for the work order is COMP (Complete), click Save as Plan.

---

## Relating work orders or tickets to activities or to tasks

You can link work orders and tickets to an activity or task. When you link a record to a work order, its relationship type is RELATED.

---

### Procedure

1. In the Activities and Tasks application, display the record to which you want to add related records.
  2. On the Related Records tab, perform either of the following actions:
    - To relate a work order to the current record, in the Related Work Orders table window, click Add Row.
    - To relate a ticket to the current record, in the Related Tickets table window, click Add Row.
  3. Type or select a work order in the Work Order field, or specify a ticket in the Related Record Key field.
  4. Optional: You can enter a class.
  5. Save the activity.
- **[Assigning a parent to a work order](#)**  
You can assign a parent to a work order and assign tasks to that parent. When you assign work order records to a parent, they become child work orders records of the parent record.
  - **[Removing relationships between records](#)**  
You can remove the relationship between an activity or a task and its related work orders or tickets.

---

## Assigning a parent to a work order

You can assign a parent to a work order and assign tasks to that parent. When you assign work order records to a parent, they become child work orders records of the parent record.

---

### About this task

You cannot assign parent records to closed work order records. If the parent has a value in the Priority field, and the child or children work order records do not, the child or children work order records inherit the parent priority value.

---

### Procedure

1. Open an application and display the work order record that you want to update.
2. On the List tab, select the task that you want to update.
3. Select the Assign To New Parent action.
4. Select the work order record that you want as the new parent.  
The asset management system displays the parent work order number in the Parent WO field.
5. Click Save record.

## Removing relationships between records

You can remove the relationship between an activity or a task and its related work orders or tickets.

### Before you begin

You can remove the relationship between records only if the ticket or the work order has a type of RELATED.

### About this task

To delete relationships with work orders of other relationship types, such as FOLLOWUP or ORIGINATOR, delete the work order in any of the following applications:

- Work Order Tracking
- Activities and Tasks
- Changes
- Releases

To delete relationships with tickets of other relationship types, you must go to the tickets applications.

### Procedure

1. In the Activities and Tasks application, display the record with the related relationship that you want to delete.
2. On the Related Records tab, select the record in the Related Work Orders table window.
3. Click the Mark Row for Delete icon. You can mark more than one row.
4. Click Save Activity.

## Classifying activity records

To simplify the process of finding and managing activity records, you can classify the records. Categorizing an activity involves classifying it and adding and modifying attributes to further group the classification.

### About this task

For example, you might classify an activity as a notebook. The notebook classification might have the attributes of memory, speed, and disk space associated with it, which are copied to the record upon classification. As needed, you can add attributes such as operating system and power, change the attribute values, and remove attributes associated with the record.

### Procedure

1. In the Activities and Tasks application, display the activity record that you want to categorize.
2. Select a classification for the activity in one of the following ways:

Choice	Description
Use the Classification field	In the Classification field of the main application tab or on the Activities and Tasks tab, click Detail Menu and then select Classify to produce a classification hierarchy tree that you can drill down through and select a classification.
Use the Class Description field	In the Class Description field of the main application tab or on the Activities and Tasks tab, you can hasten the classification search as follows: a. Click the Select Value icon next to the Class Description field and enter a keyword or a word string, such as Operating System into the Description field of the window. All classification values that contain the keyword or word string are retrieved. b. Click a value from the resulting list to select the classification.

3. Optional: You can view the attributes that are associated with the selected classification in the Attributes table window. You can also add, delete, and change the values of the attributes in the row details.
4. Save the activity.  
The full classification path appears in the Classification field, where you can view all nodes of the classification.

## Setting up work process flows

Work process flows use relationships between work orders and tasks to automate the flow of status changes. You set relationships between work orders and tasks so that when a task is completed, the next task in the flow can be initiated.

### Before you begin

To set the process flow for individual tasks, you must select Under Flow Control at the header level for the work order.

## About this task

The best practice for consistently using the flow feature is to set up the process flow as a work template at the job plan level.

## Procedure

1. Open the work order.
2. Select Under Flow Control.
3. On the Plans tab, display the details for the task.
4. In the Scheduling Information section, next to the Predecessors field, click the Detail Menu icon.
5. Select the tasks that must be completed before this task is initiated.
6. Save the work order.

- **Defining flow actions**

A flow action is used in a work process flow to define certain actions that should occur while work is being done. Actions or action groups can be applied to any work order, task, or job plan task.

- **Removing work process flow from work orders or job plans**

You can remove work process flow for a work order, a job plan, or task records that have it defined. You can do this at the header level, which will remove it for all the associated tasks as well, or you can remove it at the task level.

- **Suspending work process flows**

You can suspend the work process flow for work order or task records that have it defined. For example, if you want to start a work order or task manually, you could suspend the flow control on that record. The flow remains suspended until you remove the suspension.

- **Stopping workflow processes**

You can stop a workflow process for a record. You use the Workflow Administration application to view and stop workflow processes.

## Defining flow actions

A flow action is used in a work process flow to define certain actions that should occur while work is being done. Actions or action groups can be applied to any work order, task, or job plan task.

## About this task

You can determine whether the action takes place automatically, or if the action only takes place when it is initiated manually. When automatic, the action takes place as soon as the work order or task status is changed to an in progress (INPRG) status value by work process flow. When manual, you must initiate the flow action by running the automation or processing scripts or placing an action button on the target application. Actions and action groups are defined in the Actions application.

## Procedure

1. In an application that supports flow action, display the record for which you want to define a flow action.
2. Perform one of the following actions:
  - For a work order, change, release, or job plan record, enter a value in the Flow Action field on the application tab.
  - For a work order or job plan task, enter a value in the Flow Action field in the Task table window. The Tasks table window is found on the main tab of the Job Plans application, or the Plans tab of the Work Order Tracking, Changes, and Releases applications.

The defined action runs when the work order or task status value is changed to INPRG.

3. Specify whether you want the flow action to be automatically run:

Option	Flow Action Assist
Automatically run the flow action	Cleared
Manually run the flow action	Selected

4. Click Save record.

## Removing work process flow from work orders or job plans

You can remove work process flow for a work order, a job plan, or task records that have it defined. You can do this at the header level, which will remove it for all the associated tasks as well, or you can remove it at the task level.

## About this task

If work process flow is removed at the header level, it will automatically be removed on individual tasks on the record. You cannot retain work process flow for a task that does not have it set at the header level.

## Procedure

1. In an application that supports flow action, display the record that you want to remove from work process flow.
2. On the main application tab, clear the Flow Controlled check box. The system removes the work order or the job plan, and all of its tasks from work process flow.
3. Click Save Record.

---

## Suspending work process flows

You can suspend the work process flow for work order or task records that have it defined. For example, if you want to start a work order or task manually, you could suspend the flow control on that record. The flow remains suspended until you remove the suspension.

### Before you begin

---

Removing the suspension restarts the flow. Any successor work orders or tasks with completed predecessors continue the process. Work orders and tasks without predecessors continue the process at the same time as the parent record. The last completed child under a parent rolls its completion up to the parent.

### Procedure

---

1. In an application that supports flow action, display the record on which you want to suspend flow control.
2. On the main application tab, at the header level, select the Suspend Flow Control check box. The system suspends the work process flow on the work order and on all of its tasks.
3. To retain flow control for individual tasks, display the tasks in the Tasks table window, and clear the Suspend Flow Control check box at the task level. Flow control remains in place at the task level. This action does not affect the suspension at the work order header level. You can find the Tasks table window on the Plans tab.
4. Click Save Record.

### Example

---

You generally suspend a set of tasks, often under the same parent. For example, you can delay the automatic starting of one whole phase of work until a certain condition has been met. You can also delay starting a phase of work to make changes to the tasks, such as inserting tasks, deleting tasks, and changing the precedence logic.

---

## Changing the status of activities or tasks

You can change the status of an activity to indicate the position of the activity as it moves toward completion.

### Procedure

---

1. In the Service Requests, in the Problems, or in Incidents application that corresponds to the type of record you are managing, display the record whose status you want to change.
2. Select the Change Status action.
3. In the New Status field, choose a status from the pull-down menu.
4. Click OK to change the status.

### What to do next

---

If you change a ticket to a RESOLVED status, and you are the designated owner of that ticket, you might want to stop the timer or otherwise report the time that you spent resolving the issue.

---

## Work Orders module

You use the Work Orders module to track the work that has been performed in the past, and future work that is being planned.

A work order is a request for work to be performed. The information that is contained on a work order includes the following:

- The tasks that were performed
- The labor hours involved in performing the work
- The services used, if any
- The materials used, if any
- The tools required to do the work
- The assets worked on
- The locations where the work was performed
- [Work Order Tracking](#)  
In the Work Order Tracking application, you create and manage work orders for assets and locations. A work order specifies a particular task, and the labor, materials, services, and tools needed to complete the task.
- [Labor Reporting](#)  
You use the Labor Reporting application to report the type and the total number of hours of work that external contractors or internal employees performed.
- [Quick Reporting](#)  
You use the Quick Reporting application to plan, to review, and to approve work orders for assets and locations. When you create a work order, you initiate the maintenance process and create a historical record of the work being performed.

- [Assignment Manager](#)  
You use the Assignment Manager application to dispatch labor and schedule work for your organization.
- [Service Requests](#)  
You use the Service Requests application to manage requests for services that involve an asset or location in your enterprise. For example, you might receive a request to upgrade the computer software on the notebook for a user, or for all users at certain locations.
- [Work Orders application](#)  
The Work Orders application is a modernized, simplified version of the Work Order Tracking application that contains the most important actions and information for work orders. It also contains workflow assignment integration, a new status bar, the ability to organize work orders into custom views, and productivity features, such as type-ahead search.
- [Workflow Assignments application](#)  
You can use the Workflow Assignments application to monitor your workflow assignments and take advantage of time-saving features.

---

## Work Order Tracking

In the Work Order Tracking application, you create and manage work orders for assets and locations. A work order specifies a particular task, and the labor, materials, services, and tools needed to complete the task.

When you create a work order, you initiate the maintenance management process and create a historical record of the work requested and performed.

You can create work orders in applications other than Work Order Tracking. These applications include the Changes application, Condition Monitoring application, Incidents application, Preventive Maintenance application, Problems application, Quick Reporting application, Releases application, and Service Requests application.

- [Work orders overview](#)  
A work order specifies a particular task and the labor, materials, services, and tools required to complete the task.
- [Working with work orders](#)  
Work orders initiate the maintenance process and create a historical record of the work that is performed.

---

## Work orders overview

A work order specifies a particular task and the labor, materials, services, and tools required to complete the task.

- [Work order management plans](#)  
After you create a work order, you can use the Plans tab to specify estimates for labor, craft, materials, services, and tools. You also can add child work orders and create tasks for the work order.
- [Work orders](#)  
A work order specifies the asset, location, and the work required. You can apply service level agreements and assign ownership. The status of the work order changes as it moves through processing cycle. Duplicating a work order can save time when you need to create a work order with similar information.
- [Work packages](#)  
When you create a work package, you group existing work orders under a new parent work order. A work package can be useful, for example, when you have a work order with 100 separate tasks and 90 of the tasks have been completed. You can group the remaining 10 tasks into a work package with a new parent work order. The 10 tasks become tasks under the new work order, and any work orders that are not tasks become children of the new work order.
- [Actuals on work orders](#)  
As work progresses on the work order, you can report the actual labor hours, materials, services, and tools used.
- [Record relationships and work orders](#)  
Relationships between records, such as work orders and tickets, help to simplify record management. You can create record relationships manually or relationships can be created automatically when you take certain actions.
- [Failure analysis](#)  
Failure data enables you to record and view asset and location problems, causes, and remedies associated with work orders. This data enables you to identify trends and isolate probable causes of breakdowns.
- [Measurement points for work assets on work orders](#)  
Work assets on a work order can have measurement points, which allow you to track the usage and condition of your assets. You can add measurement points to a work order until the work order is closed.
- [Preventive maintenance alerts](#)  
Preventive maintenance alerts notify you of preventive maintenance work that is due for an asset. You can also be alerted about preventive maintenance that is due for a location. You can use preventive maintenance alerts to help reduce asset downtime and perform maintenance more regularly and efficiently.
- [Work record approval](#)  
When work records, such as work orders, changes, and releases, have a status of Waiting on Approval, you can change the status to Approved.
- [Rules for changes to archived work orders](#)  
Closed and canceled work orders are archived and become historical records. You can add information to a closed record by using the Edit History Work Order action.
- [Deletion rules for work orders](#)  
For auditing purposes, you cannot always delete work orders. If you cannot delete a specific work order, you can stop all action on a work order by changing the status to canceled.

---

## Work order management plans

After you create a work order, you can use the Plans tab to specify estimates for labor, craft, materials, services, and tools. You also can add child work orders and create tasks for the work order.

## Job plans

---

An easy way to add a work plan to a work order is to associate a job plan with the work order. When you insert an identifier in the Job Plan field, the system copies the job plan, called a work plan, to the work order. You can also add a job plan by using another application to generate a work order that already has a job plan.

The system can also add a safety plan to the work order, if the job plan and its assets or locations have a safety plan. Changes you make to the work plan or safety plan in an individual work order do not affect the original job plan or safety plan.

## Task plans

---

You can insert or edit work plan tasks on the Plans tab. You can also add inspection data for the work asset.

If a current work plan is based on a job plan, the system copies all task and plan data from the job plan. The job plan serves as a template for the work plan. Changes you make to the work plan on the work order do not affect the original job plan.

You can add or edit plan tasks until the work order is closed. You cannot delete tasks if the work order is approved or has actuals reported for the task.

After you close the work order, you can use the Edit History Work Order action to add or modify tasks.

- [Safety plans](#)  
In the Work Order Tracking application, you can associate a safety plan with a work order. Safety plans help ensure that the work is performed safely. Until the work order is approved, you can remove or change the associated safety plan.
- [Safety hazards associated with work orders](#)  
You associate hazards with safety-related assets for the asset or location listed on a work order by adding hazards to the safety plan.
- [Work plan removal](#)  
Under certain circumstances, you can remove a work plan from a work order by using the Remove Work Plan action.

---

## Safety plans

In the Work Order Tracking application, you can associate a safety plan with a work order. Safety plans help ensure that the work is performed safely. Until the work order is approved, you can remove or change the associated safety plan.

A work order can have only one associated safety plan. If a work order already has an associated safety plan, you must first remove the existing safety plan before associating a new one. When you change the safety plan information in a work order, the original safety plan in the Safety Plans application remains unchanged.

A safety plan can be automatically associated with a work order in the following cases:

- A job plan is added to a work order.
- A work order is generated by a condition monitoring or preventive maintenance record that has an associated job plan.

When the work order is in the status specified in the Organizations application, you cannot change the associated safety plan.

---

## Safety hazards associated with work orders

You associate hazards with safety-related assets for the asset or location listed on a work order by adding hazards to the safety plan.

The association between the asset or location on the work order and their related assets and hazards must exist on the asset record or location record. Safety-related assets might have safety hazards that affect the work environment for the current work order.

You use the Select Safety Hazards action to add safety hazards. Safety hazards include the following information:

- Whether the asset or location can have tag outs.
- Whether the asset or location can have hazardous materials.
- Whether the asset or location can have precautions.

If you enter any item also identified as hazardous material, information for the hazard is automatically added in the Safety Plan tab.

---

## Work plan removal

Under certain circumstances, you can remove a work plan from a work order by using the Remove Work Plan action.

When you remove a work plan, all information in the Plans tab, except for non-task children, is removed. Also, if the work plan has a job plan, the job plan identifier is removed.

If any task in the work plan cannot be removed based on the deletion rules for work orders, you cannot use the Remove Work Plan action. You can still delete labor, material, services, and tools information, as well as any tasks that do meet the deletion rules.

---

## Work orders

A work order specifies the asset, location, and the work required. You can apply service level agreements and assign ownership. The status of the work order changes as it moves through processing cycle. Duplicating a work order can save time when you need to create a work order with similar information.

- **[Service level agreements](#)**  
A service level agreement (SLA) typically is a written agreement that outlines the commitment between a service provider and its customers. A commitment is a service level that all parties have agreed to, such as asset reliability or availability.
- **[Ownership of work orders](#)**  
You can designate an individual or a group as the owner of a work order or ticket. Ownership means that the person or group has administration responsibility for that record. Assigning ownership does not change that person or group's availability to work or to have ownership of additional records.
- **[Work order statuses](#)**  
The status of a work order indicates its position in the processing cycle. The status determines which actions can be performed on the work order. For example, if the work order is approved, it has a status of APPR and the tasks can begin.
- **[Duplication of work orders](#)**  
To save time, you can create a copy of a work order that includes information from the original work order. You can duplicate a work order with its tasks, without its tasks, or with its hierarchy. When you duplicate the work order hierarchy, the child tasks are also duplicated.

---

## Service level agreements

A service level agreement (SLA) typically is a written agreement that outlines the commitment between a service provider and its customers. A commitment is a service level that all parties have agreed to, such as asset reliability or availability.

The SLA describes one or more commitments and the escalation actions or notifications associated with each commitment. Escalation actions or notifications might be associated with an SLA to ensure that commitments are met. An escalation process can monitor all activities and send notifications or perform other activities to ensure that commitments are met.

The types of records to which service level agreements can be applied include tickets, such as service requests, and work-based records, such as work orders. Before you can apply an SLA to a record, the record must have a site defined.

A service level agreement can be associated with a record in several ways:

- An SLA might automatically be applied to a record from within a workflow or escalation process, or from another SLA.
- You can select an action to apply an SLA, which applies the best match automatically.
- You can view SLAs and select an action to select or clear the SLAs that you want to manually apply to the record.

When you apply a service level agreement to a record, the following events occur:

- The SLA Applied check box on the main tab of the record is selected to document the action.
- Any escalations that are associated with the SLA are activated.
- The Target Start, Target Finish, and Contact values for the record might be calculated automatically as follows:

Automatically calculated values
When an SLA is applied that includes a response commitment, the response commitment date populates the Target Start date field of the record.
When an SLA is applied that includes a resolution commitment, the resolution commitment date populates the Target Finish date field of the record.
When an SLA is applied that includes a contact commitment, the contact commitment date populates the Target Contact date field of the record.

---

## Ownership of work orders

You can designate an individual or a group as the owner of a work order or ticket. Ownership means that the person or group has administration responsibility for that record. Assigning ownership does not change that person or group's availability to work or to have ownership of additional records.

Ownership can change hands throughout the course of the record life cycle. You can change ownership until the record has a status of CLOSE.

You use the View History action to see the ownership and status history of a record. Record ownership is not required for a work order or ticket.

You can assign ownership in the following ways:

- Use the Select Owner action to choose a person or owner.
- Use the Take Ownership action if you want to be responsible for that record.

---

## Work order statuses

The status of a work order indicates its position in the processing cycle. The status determines which actions can be performed on the work order. For example, if the work order is approved, it has a status of APPR and the tasks can begin.

WAPPR

The work order is waiting for approval. WAPPR is the default status for work orders that are created in the Work Order Tracking, Changes, Releases, and Activities applications.

APPR

The work order is approved and the work can begin.

WSCH

The work order is waiting to be scheduled. WSCH is the default status for work orders that are created in the Preventive Maintenance application.

WMATL

Materials must arrive before the work can be performed.

WPCOND  
The work can be performed only when the condition of the plant is suitable. For example, certain work might require that the plant is shut down.

INPRG  
The work is in progress. INPRG is the default status for work orders that are created in the Quick Reporting application.

COMP  
The physical work is completed.

CLOSE  
The work order is closed. Inventory reservations for items that were not used for the work listed on the work order are removed, and the work order becomes a history record.

CAN  
The work order is canceled. You cannot cancel a work order if the work is already in progress or if actuals are already reported.

HISTEDIT  
The work order was edited in history.

## Effects of changing work order statuses

Work orders can be controlled by a workflow process, which can lead to automatic status changes.

Child work orders can inherit status changes from their parent. Inheritance of status changes is controlled by the Inherit Status Changes check box.

If you are using process flow control, you can ensure that the status is inherited from the parent work order to the child work order. To allow status inheritance, you must activate the `mxe.app.wo.flowControlStatusInheritance` setting in the System Properties application. Two statuses can never be inherited with process flow control; the Flow Start and Flow Complete statuses. Flow Start and Flow Complete are INPRG and COMP, by default. You can change the default status settings in the Organizations application, by selecting Work Order Options, > Work Type and specifying values for the start status and the complete status.

The following table shows the effects of changing the status of a work order.

Change to status	Effects
APPR (Approved)	<ul style="list-style-type: none"> <li>The work plan items are reserved in the Inventory application and in the cost and rate data.</li> <li>Rates can be changed in the Inventory application, the Labor application, or the Tools application. If the rates change, the work plan reflects the rates in effect when the work order was approved.</li> <li>You can no longer delete the work order.</li> </ul>
CAN (Canceled)	<ul style="list-style-type: none"> <li>Work orders that are not started are canceled.</li> <li>Work orders that have no actuals reports are also canceled.</li> <li>Canceled work order become history records.</li> </ul>
CLOSE (Closed)	<ul style="list-style-type: none"> <li>The work order is finalized.</li> <li>Inventory reservations for unused items on the work order are removed.</li> <li>The work order becomes a history record.</li> </ul>
COMP (Completed)	<ul style="list-style-type: none"> <li>All physical work that is associated with a work order is finished.</li> <li>If you planned to move or modify an asset on the work order, the move or modification occurs when the status is changed to COMP.</li> </ul>
INPRG (In Progress)	<ul style="list-style-type: none"> <li>Physical work on the work order is currently in progress.</li> </ul>

## Allowed changes to work order statuses

The following table shows the possible changes to the status of a standard work order. However, process flow control can restrict which status changes are possible.

Status	New status options
WAPPR	<ul style="list-style-type: none"> <li>INPRG</li> <li>CAN</li> <li>WMATL</li> <li>COMP</li> <li>WPCOND</li> <li>APP</li> <li>CLOSE</li> </ul>
APPR	<ul style="list-style-type: none"> <li>INPRG</li> <li>WMATL</li> <li>COMP</li> <li>WPCOND</li> <li>WAPPR</li> <li>CAN</li> <li>CLOSE</li> </ul>

Status	New status options
WSCH	<ul style="list-style-type: none"> <li>• INPRG</li> <li>• WMATL</li> <li>• COMP</li> <li>• WPCOND</li> <li>• WAPPR</li> <li>• CAN</li> <li>• CLOSE</li> </ul>
WPCOND	<ul style="list-style-type: none"> <li>• INPRG</li> <li>• WMATL</li> <li>• COMP</li> <li>• WPCOND</li> <li>• WAPPR</li> <li>• CAN</li> <li>• CLOSE</li> </ul>
WMATL	<ul style="list-style-type: none"> <li>• INPRG</li> <li>• COMP</li> <li>• WPCOND</li> <li>• WAPPR</li> <li>• CAN</li> <li>• CLOSE</li> </ul>
INPRG	<ul style="list-style-type: none"> <li>• WMATL</li> <li>• COMP</li> <li>• WAPPR</li> <li>• CLOSE</li> </ul>
COMP	CLOSE
CAN	None.
CLOSE	HISTEDIT

---

- [Workflow properties](#)

## Duplication of work orders

To save time, you can create a copy of a work order that includes information from the original work order. You can duplicate a work order with its tasks, without its tasks, or with its hierarchy. When you duplicate the work order hierarchy, the child tasks are also duplicated.

To duplicate a work order, use the Duplicate Work Order action. If a work order that you are duplicating has a job plan or a safety plan, these plans are copied to the duplicate work order. Work actuals, failure reports, and planned moves or modifications are not copied to the duplicate work order.

## Work packages

When you create a work package, you group existing work orders under a new parent work order. A work package can be useful, for example, when you have a work order with 100 separate tasks and 90 of the tasks have been completed. You can group the remaining 10 tasks into a work package with a new parent work order. The 10 tasks become tasks under the new work order, and any work orders that are not tasks become children of the new work order.

To create work packages, select the work orders, then use the Create Work Package action.

## Actuals on work orders

As work progresses on the work order, you can report the actual labor hours, materials, services, and tools used.

- [Actual labor hours for work orders](#)  
To track the actual labor hours that were required to complete the work, you use the Labor subtab on the Actuals tab in the Work Order Tracking application.
- [Actual material use for work orders](#)  
To track the actual quantities, locations, and costs for items used on an approved work order you use the Materials subtab on the Actuals tab in the Work Order Tracking application. You can copy data from an existing plan, modify this data to reflect actual events, or insert new data.
- [Actual tool use for work orders](#)  
To track the actual quantities, hours, and rates for tools used on an approved work order, you use the Tools subtab on the Actuals tab in the Work Order Tracking application.
- [Costs on tickets and work orders](#)  
You can view the estimated and actual costs for a single work order or ticket, including costs for labor, material, tools, and services. You can also view total costs for the current record and all the records below it in its hierarchy.

---

## Actual labor hours for work orders

To track the actual labor hours that were required to complete the work, you use the Labor subtab on the Actuals tab in the Work Order Tracking application.

You can specify and change actual hours for labor only on an approved work order. You can copy data from an existing plan and you can modify the data to reflect actual events. You can specify labor and crafts until you close the work order.

You can report actual labor hours in the following ways:

- Report hours for multiple types of labor at the same time.
- Copy labor from the work plan.
- Report labor individually.
- Select planned labor.

---

## Actual material use for work orders

To track the actual quantities, locations, and costs for items used on an approved work order you use the Materials subtab on the Actuals tab in the Work Order Tracking application. You can copy data from an existing plan, modify this data to reflect actual events, or insert new data.

When you issue an item to a work order and it is not currently a spare part of the asset on the work order, the system might automatically add it to the spare parts list of the asset. The Add as Spare Part check box must be selected for the record in the Item Master application for the spare part list. You can insert new rows until you close the record, but can edit information only until you save the record.

You can report actual material use in the following ways:

- Select multiple items at once.
- Select items reserved in the inventory, based on the work plan.
- Select spare parts for the asset.
- Report materials individually.

---

## Actual tool use for work orders

To track the actual quantities, hours, and rates for tools used on an approved work order, you use the Tools subtab on the Actuals tab in the Work Order Tracking application.

You can copy data from an existing plan, and delete from, add to, or change this data to reflect actual events. Work orders must be approved before you can report actuals. You can insert new rows until you close the record, but can edit information only before you save the record.

You can report actual tool use in the following ways:

- Select tools from the database.
- Copy tool data from the work plan.
- Select tools that were issued to the work order.
- Report individual tool use.

---

## Costs on tickets and work orders

You can view the estimated and actual costs for a single work order or ticket, including costs for labor, material, tools, and services. You can also view total costs for the current record and all the records below it in its hierarchy.

When you view the costs of a ticket or work order, the data is displayed in two tables:

- The Totals table displays the costs for a single ticket or work order.
- The View Hierarchy Grand Totals table displays the costs for the current ticket or work order and all records under its hierarchy.

Each table presents the same information, which is shown in the following table.

Column	Explanation
Current Estimate	Displays read-only calculated values for the current totals from the Labor, Materials, Standard Services, and Tools tabs of the Plans tab for the ticket or work order.
Estimate at Approval	Is set to zero until the work order is approved, then the values are copied from the Current Estimate column and are read-only. If the work order status changes from approved to unapproved, then these fields are cleared. The estimated costs at approval are not affected by the change in status from in progress to completed or closed.
Actual	Displays the read-only values from the Labor (for approved labor only), Materials, and Tools tabs of the Actuals tab. If the status of the record changes from approved, then these fields are not cleared.

---

## Rolling up maintenance costs

After you close a work order that is associated with an asset, you can calculate your maintenance costs by rolling up costs that you incur for labor, materials, tools, and services to the top-level asset in the hierarchy that the asset belongs to.

Costs can be rolled up manually or automatically. By default, cost rollups are manual. If you want costs to be calculated and rolled up automatically when a work order is closed, you must set the `mxe.workorder.rollupMaintenanceCosts` system property to 1. After you configure the system property for automatic rollups, all subsequent costs that are associated with work orders are rolled up automatically. However, any unprocessed maintenance costs that existed before the configuration are not automatically rolled up. You must roll up any preexisting, unprocessed maintenance costs manually.

To calculate the maintenance cost of your assets, use the Roll Up Maintenance Costs action in the Assets application.

If you upgrade to Maximo® Manage 8.5, run the Asset Cost Rollup Report to roll up pending maintenance costs before the upgrade.

---

## Record relationships and work orders

Relationships between records, such as work orders and tickets, help to simplify record management. You can create record relationships manually or relationships can be created automatically when you take certain actions.

The following types of relationships can exist between records:

- Related
- Originator and follow-up
- Related to global

---

### Related records

Using the Work Order Tracking application, you can view records and relate work orders to the current record. You relate work orders informally for information purposes and to create a relationship between records. A related relationship does not determine status inheritance, affect workflow, or follow a set of business rules. Related relationships can be many-to-many, and do not represent record hierarchies.

You use the Related Records tab of the Work Order Tracking application to create relationships to other work orders and tickets. Relationships that you create on the Related Records tab have a relationship type of Related.

When you create relationships between records, you can take the following actions:

- Modify related records.
- View related information for similar records.
- View open tickets that are associated with a specific field in the Work Order Tracking application.

---

### Originator and follow-up work orders

From the current work order, you can create another related record by selecting the Create action. When you create a work order or a ticket from an existing work order, the new record has a status of Follow-up. The original work order has a status of Originator.

You create follow-up work orders to associate work orders and tickets with each other and keep them in separate hierarchies. The costs of the follow-up work orders in separate hierarchies do not roll up to the same parent. For example, you can create a follow-up work order when you complete a job and observe that additional work is needed on the same asset or location.

A follow-up work order can determine the status of its originating ticket. An originating ticket cannot change the status of a follow-up work order. A follow-up ticket cannot change the status of the originator ticket if there is more than one follow-up. Your system administrator can configure these options.

When you create follow-up work orders, the asset, location, and general ledger account are copied from the originating work order to the follow-up work order.

You can view follow-up work orders on the Related Records tab of the originating record.

---

### Globally related tickets

A global record is a ticket (a service request, a problem, or an incident record) that outlines an issue that affects many users. To make a ticket a global record, you must select the Global Issue check box on the ticket. You can then select the Show Similar Tickets action in the toolbar to select tickets to relate to the global ticket, creating a RELATEDTOGLOBAL relationship.

You can use this relationship type to manage all tickets that are included in the global ticket. For example, when you change the status of the global ticket, the system changes the status of all globally related tickets.

If your administrator has set up automated notifications of status changes, then the system changes the status of the tickets related to the global issue. All of the initial requesters reporting the same issue are notified of its resolution.

On the global ticket, you can view a list of related records and view the work and communication logs for all related records.

You cannot designate a record as global if it is already related to a global record or if it is a history record.

---

## Failure analysis

Failure data enables you to record and view asset and location problems, causes, and remedies associated with work orders. This data enables you to identify trends and isolate probable causes of breakdowns.

You can use failure data to conduct failure analysis to review the history of asset and location failures over time. For example, you review issues such as breakdown trends or mean time between failures. You can correlate this failure information with other data such as preventive maintenance schedules to develop ways to reduce or limit asset and location failures.

In the Work Order Tracking application, you view the failure data information in the Failure Reporting tab. Failure data must belong to one or more failure hierarchies, which you create in the Failure Codes application. When you report failures, you use failure hierarchies.

A failure hierarchy is an organized set of data on problems, causes, and remedies related to assets and locations. The failure hierarchy is identified by a top-level failure code, called a failure class. If the asset or location on a work order is associated with a failure class, the default failure class value is the associated failure class.

---

## Measurement points for work assets on work orders

Work assets on a work order can have measurement points, which allow you to track the usage and condition of your assets. You can add measurement points to a work order until the work order is closed.

Measurement points are copied to work plans when the following items are matched:

- The measurement point name on the job plan that is listed on the work order.
- The measurement point name on the asset that is listed on the work order.
- A measurement point number for the measurement point name.

If you add a value for a measurement point, the new measurement and measurement date are copied to the MEASUREMENT database table. If you add a measurement without adding a value for the measurement point, the measurement data is saved with the work order. When you save a work order with measurement point data, the Measurement Point field becomes read-only.

---

## Preventive maintenance alerts

Preventive maintenance alerts notify you of preventive maintenance work that is due for an asset. You can also be alerted about preventive maintenance that is due for a location. You can use preventive maintenance alerts to help reduce asset downtime and perform maintenance more regularly and efficiently.

Preventive maintenance alerts are triggered when either of the following criteria are met:

- The system date is on or after the estimated next due date minus the number of days that is specified in the Alert Lead (Days) field.
- The current meter reading for the asset or location is greater than the next meter reading projection minus the number of units that is specified in the Alert Lead field.

---

## Work record approval

When work records, such as work orders, changes, and releases, have a status of Waiting on Approval, you can change the status to Approved.

Keep in mind the following system behavior that pertains to work record approval:

- When you approve a work record, the system reserves the work plan items in Inventory and records cost and rate data. If rates change in Inventory, Labor, or Tools, the work plan reflects the rates in effect when the change was approved.
- An approved record cannot be deleted.
- When you approve a work record, the tasks on the record are also approved.
- If you approve a work record that has child work orders with their Inherit Status Changes check box selected, the applicable child work orders are also approved.
- You can change the status of multiple work orders at the same time using the Select Records checkbox on the List tab to select the records, or you can change the status of a displayed record.

---

## Rules for changes to archived work orders

Closed and canceled work orders are archived and become historical records. You can add information to a closed record by using the Edit History Work Order action.

When you change an archived work order, the following rules apply:

- New costs that were incurred during the edit history must be added to the inventory cost, if it is charged to store.
- You can add actual labor, but you cannot change approved transactions.
- You can add actual materials and actual tools, but you cannot change them.
- You can add or delete child work orders, whether the child work orders are tasks.
- You can add failure reports.
- You can attach documents.
- You cannot change safety information.

- You cannot change planned labor, materials, and tools.
- You cannot change information in the following fields:
  - Asset
  - Location
  - GL Account
  - Charge to Store
  - Status
  - Status Date

---

## Deletion rules for work orders

For auditing purposes, you cannot always delete work orders. If you cannot delete a specific work order, you can stop all action on a work order by changing the status to canceled.

If you want to delete a work order and its child work orders, the work order and its children must meet the following criteria:

- Have a status of waiting for approval.
- Not have any transactions registered against it, except for status changes.
- Not have any actuals reported against it.
- Not have any labor assignments associated with it.
- Not have any measurements or meter readings taken against it.
- Not have been generated for a purchase order or receipt.
- Not have any failures reported against it.
- Not be in a workflow or have ever been in a workflow.
- Cannot have been created by a preventive maintenance generation.
- Cannot be follow-up work or have follow-up work.

To delete a work order, use the Delete\_> Work Order action.

---

## Working with work orders

Work orders initiate the maintenance process and create a historical record of the work that is performed.

- [Creating work orders](#)  
A work order specifies the information about the work that must be performed for an asset, location, or configuration item. You can add work plans, job plans, or safety plans. You can also record actuals as the work progresses.
- [Reporting actuals for work orders](#)  
As work progresses on an approved work order, you can report the actual labor hours, materials, services, and tools used.
- [Rescheduling and unassigning work](#)  
You can reschedule work that has been assigned to labor resources to accommodate changes in priority or scheduling. You can reschedule multiple work records at the same time using the Reschedule Assignments window.
- [Specifying meter readings on work orders](#)  
You can enter meter readings for the asset and the location on a work order. An asset can be set up to inherit the meter readings of its parent asset or its location.
- [Enabling preventive maintenance alerts for work orders](#)  
You can use preventive maintenance alerts to notify you of pending preventive maintenance work that is scheduled for assets or locations in work order records.
- [Reporting downtime for assets](#)  
You can report the start time and the end time of the downtime for an asset after it has occurred.
- [Swapping assets](#)  
You can swap assets associated with a work order. The swap action applies to the work order and all of the assets, locations, and configuration items on its child work orders. The term "work order" can refer to a work order, change, release, or activity record.
- [Categorizing work orders with classifications and attributes](#)  
To simplify the process of finding and managing records, you can categorize work orders. Classifications identify work orders as involving a type of item, such as a notebook. Attributes further identify the item by providing more details. For example, a notebook can have the attributes memory, speed, and disk space.
- [Setting up work process flows](#)  
Work process flows use relationships between work orders and tasks to automate the flow of status changes. You set relationships between work orders and tasks so that when a task is completed, the next task in the flow can be initiated.
- [Changing the status of a list of records](#)  
You can change the status of multiple records in applications.

---

## Creating work orders

A work order specifies the information about the work that must be performed for an asset, location, or configuration item. You can add work plans, job plans, or safety plans. You can also record actuals as the work progresses.

---

## Procedure

1. In the Work Order Tracking application, click the New Work Order icon in the toolbar.
  2. Specify whether you are creating the work order for a location, asset, configuration item, or general ledger account.  
If a selected location has a single associated asset, the asset value is copied to the record. If a selected asset is a linear asset, additional fields display.
  3. Optional: Specify a type for the work order and the priority of the work order for scheduling purposes.
  4. Specify any additional schedule information and responsibility information.  
You can specify a job plan, safety plan, failure class, scheduling information, and planned labor, materials, tools, and services.  
If you specify a job plan or job task that is related to an inspection form, that inspection form is automatically added to the Inspection Form field.
  5. Save the work order.
- **[Associating safety plans with work orders](#)**  
You can associate a safety plan with a work order to help ensure that the work is performed safely. You can associate a safety plan until the work order is approved. If a work order already has an associated safety plan, you must remove it before you can select another safety plan.
  - **[Creating work plans for work orders](#)**  
You can create a work plan for a work order. A work plan describes the labor, materials, tools, services, and tasks that are needed to complete a work order.
  - **[Applying service level agreements to records](#)**  
You can apply a service level agreement (SLA) to a record to define the agreement and formal commitments between a service provider and a customer. The agreement documents the service to be provided or received, the agreed upon service levels for the service, and the means of measuring or quantifying the level of service.
  - **[Applying routes to work orders](#)**  
You can apply a route to a work order to define a list of related work assets. For example, you can define assets, locations, or a combination of both; each of which is considered to be a stop along the route. The work assets can be related by location, such as all pumps and motors in a room. Or they can be related by the type of asset, such as all fire extinguishers at a site.
  - **[Creating related records](#)**  
To save time and simplify work order management, you can create new records and relate them to your work order. You can associate other records with a work order, such as incidents, releases, service requests, and other work orders.
  - **[Removing relationships between records](#)**  
You can remove the relationship between a work order and its related work orders or tickets.
  - **[Assigning a parent to a work order](#)**  
You can assign a parent to a work order and assign tasks to that parent. When you assign work order records to a parent, they become child work orders records of the parent record.

---

## Associating safety plans with work orders

You can associate a safety plan with a work order to help ensure that the work is performed safely. You can associate a safety plan until the work order is approved. If a work order already has an associated safety plan, you must remove it before you can select another safety plan.

---

### Procedure

1. In the Work Order Tracking application, select the work order with which you want to associate a safety plan.
2. In the Job Details section of the Work Order tab, specify the details for the safety plan.
3. In the Select Value window, select one of the following options to view available safety plans:
  - To view all safety plans in the database, select Show All Safety Plans.
  - To view safety plans that are associated with the asset or location on the work order, select Show Safety Plans for the Current Work Order.
  - To view safety plans that are associated with the job plan on the work order, select Show Safety Plans for the Job Plan of the Current Work Order.
4. Save the work order.

---

## Creating work plans for work orders

You can create a work plan for a work order. A work plan describes the labor, materials, tools, services, and tasks that are needed to complete a work order.

---

### Procedure

1. In the Work Order Tracking application, select the work order for which you want to create a work plan.
2. On the Plans tab, provide the following information:

Option	Description
<b>Work plan task information</b>	In the Tasks for Work Order table window, add work plan information.
<b>Labor information</b>	On the Labor subtab, select existing labor or add labor.
<b>Planned materials information</b>	On the Materials subtab, provide information for planned materials or items for the work order.
<b>Services information</b>	On the Services subtab, select standard services or add services.
<b>Tools information</b>	On the Tools subtab, select tools or add tools.

3. Save the work plan.
- **[Associating work plans with work orders](#)**  
You can associate an existing work plan with a work order. A work plan describes the labor, materials, tools, services, and tasks that are needed to complete a work order. Changes that you make to the associated work plan do not affect the original job plan.
  - **[Adding work plan tasks to work orders](#)**  
You can add or change work plan tasks until the work order is closed. However, you cannot delete work plan tasks from an approved work order or from a work order that has actuals reported for the work plan task.

- [Creating job plans from work plans](#)

You can create a job plan from the work plan instead of recreating the work plan each time that you need it. When you create a job plan from a work plan, the asset management system uses the current work order and its tasks, planned labor, materials, tools, and services to create the job plan.

---

## Associating work plans with work orders

You can associate an existing work plan with a work order. A work plan describes the labor, materials, tools, services, and tasks that are needed to complete a work order. Changes that you make to the associated work plan do not affect the original job plan.

---

### Procedure

1. In the Work Order Tracking application, select the work order with which you want to associate a work plan.
2. In the Job Plan field of the Work Order tab, specify the plan that you want to associate.
3. Save the work order.

---

## Adding work plan tasks to work orders

You can add or change work plan tasks until the work order is closed. However, you cannot delete work plan tasks from an approved work order or from a work order that has actuals reported for the work plan task.

---

### Procedure

1. In the Work Order Tracking application, select the work order to which you want to add work plan tasks.
2. In the Tasks for Work Order table window of the Plans tab, click New Row.
3. Specify the details of the task.
4. Save the work order.

---

## Creating job plans from work plans

You can create a job plan from the work plan instead of recreating the work plan each time that you need it. When you create a job plan from a work plan, the asset management system uses the current work order and its tasks, planned labor, materials, tools, and services to create the job plan.

---

### About this task

The asset management system does not copy child work orders, if any, to the job plan. If the work assets on the work order have an associated safety plan, the asset management system does not copy the safety plan to the job plan.

---

### Procedure

1. In the Work Order Tracking application, display the work order that contains the plan that you want to use to create a job plan.
2. Select the Create Job Plan from Work Plan action.
3. If the Job Plan field is empty, enter a value, or click Autonumber to have the asset management system assign a number to the job plan.
4. Click OK.

---

### Results

The asset management system creates a job plan record that you can now access in the Job Plans application.

---

## Applying service level agreements to records

You can apply a service level agreement (SLA) to a record to define the agreement and formal commitments between a service provider and a customer. The agreement documents the service to be provided or received, the agreed upon service levels for the service, and the means of measuring or quantifying the level of service.

---

### About this task

When you apply an service level agreement to work orders, the SLA is applied only to the work order, not to its tasks. If you want to apply a service level agreement to a task, you must display the task as the current record and then apply the SLA.

You can apply service level agreements to tickets and work orders.

## Procedure

---

1. Open an application and display the record that you want to update.
2. Select the Apply SLA action.
3. Click OK.

## Results

---

The SLA Applied check box on the main tab of the selected application is selected. The target start, target finish, and contact values are calculated for the selected record.

---

## Removing service level agreements from records

To maintain accurate records, it might be necessary to remove an invalid or erroneous service level agreement to disassociate it from the record.

## Procedure

---

1. Display the record for which you want to remove a service level agreement.
2. Select the Select/Deselect SLA action.
3. Click Mark Row for Delete for each service level agreement that you want to remove from the record.
4. Click OK.
5. Save the record.

---

## Applying routes to work orders

You can apply a route to a work order to define a list of related work assets. For example, you can define assets, locations, or a combination of both; each of which is considered to be a stop along the route. The work assets can be related by location, such as all pumps and motors in a room. Or they can be related by the type of asset, such as all fire extinguishers at a site.

## About this task

---

Each route stop can have its own job plan, which the system copies to the child work order. You can apply a route to a work order in the Work Order Tracking and Quick Reporting applications.

## Procedure

---

1. Open an application and display the work order record that you want to update.
2. Select the Apply Route action.
3. Select the route that you want to apply to the work order.  
A message box opens and displays a list of child work orders that are created from the route.
4. Click Save Work Order.

## Results

---

The created child work orders display as route stops on the Plans tab in the Work Order Tracking application.

---

## Creating related records

To save time and simplify work order management, you can create new records and relate them to your work order. You can associate other records with a work order, such as incidents, releases, service requests, and other work orders.

## Procedure

---

1. In the Work Order Tracking application, select the work order for which you want to create related records.
2. Select the Create > *RecordType* action where *RecordType* is one of the following types:
  - Work Order
  - Service Request
  - Incident
  - Problem
  - Change
  - Release
  - Communication

---

## Removing relationships between records

You can remove the relationship between a work order and its related work orders or tickets.

### Before you begin

---

You can remove the relationship between records only if the ticket or the work order has a type of RELATED.

### About this task

---

To delete relationships with work orders that have other relationship types, such as FOLLOWUP or ORIGINATOR, you must delete the work order.

To delete relationships with tickets that have other relationship types, you must go to the ticket applications.

on the Related Records tab in the Work Order Tracking application.

### Procedure

---

1. In the Work Order Tracking application, select the work order with the related relationship that you want to delete.
2. On the Related Records tab, select the record in the Related Work Orders table window.
3. Click the Mark Row for Delete icon. You can mark more than one row.
4. Save the record.

---

## Assigning a parent to a work order

You can assign a parent to a work order and assign tasks to that parent. When you assign work order records to a parent, they become child work orders records of the parent record.

### About this task

---

You cannot assign parent records to closed work order records. If the parent has a value in the Priority field, and the child or children work order records do not, the child or children work order records inherit the parent priority value.

### Procedure

---

1. Open an application and display the work order record that you want to update.
2. On the List tab, select the task that you want to update.
3. Select the Assign To New Parent action.
4. Select the work order record that you want as the new parent.  
The asset management system displays the parent work order number in the Parent WO field.
5. Click Save record.

---

## Reporting actuals for work orders

As work progresses on an approved work order, you can report the actual labor hours, materials, services, and tools used.

### Procedure

---

1. Display the work order for which you want to report actuals.
2. On the Actuals tab, enter the details on the following subtabs:

Option	Description
Labor	Report hours for labor, copy labor from the work plan, or select planned labor.
Materials	Select materials, select reserved items, and select spare parts.
Services	Select services or standard services.
Tools	Select tools, copy tool data from the work plan, or select tools that were issued to the work order.

3. Save the record.

---

## Rescheduling and unassigning work

You can reschedule work that has been assigned to labor resources to accommodate changes in priority or scheduling. You can reschedule multiple work records at the same time using the Reschedule Assignments window.

## About this task

---

You can reschedule all work that has been assigned over a certain time period, or to a certain person. You can reschedule multiple work records to the same labor record for a different time period, or you can unassign the work so that you can later assign it to someone else.

## Procedure

---

1. On the Assignments tab of the Work Order Tracking application, display the work records that you want to reschedule.
2. Select the Reschedule Assignments action.  
The Reschedule Assignments panel opens.
3. To reschedule assignments to the same labor records but with a new date, enter the new date in the Reschedule Date field, and ensure that the Reschedule the Assignments check box is selected.  
Assignments with a status of ASSIGNED are rescheduled by labor availability, starting at the chosen date. Assignments with a status of WAITASGN, STARTED, or COMPLETE are not affected. Work records with no assignments or with assignments that are all in WAITASGN status receive new Scheduled Start and Scheduled Finish dates. Work records with a status of INTERRUPTED have their Scheduled Start dates cleared.
4. To unassign work without changing the Scheduled Start and Scheduled Finish dates on the work records, leave the Reschedule Date field blank and clear the Reschedule the Assignments check box.  
All assignments with a status of ASSIGNED are changed to WAITASGN. Assignments with a status of STARTED or COMPLETE are not affected. Work records with no assignments or with assignments that are all in WAITASGN status are not affected.
5. To unassign work and update the Scheduled Start and Scheduled Finish dates on the work records, enter a date in the Reschedule Date field, and clear the Reschedule the Assignments check box.  
All assignments with a status of ASSIGNED are changed to WAITASGN, and their work records receive new Scheduled Start and Scheduled Finish dates. Assignments with a status of STARTED or COMPLETE are not affected. Work orders with no assignments or with assignments that are all in WAITASGN status receive new Scheduled Start and Scheduled Finish dates. Work records with a status of INTERRUPTED have their Scheduled Start dates cleared.

---

## Specifying meter readings on work orders

You can enter meter readings for the asset and the location on a work order. An asset can be set up to inherit the meter readings of its parent asset or its location.

## About this task

---

To find out if an asset is inheriting meter readings, go to the asset record and check the value in the Accept Rolldown From field.

## Procedure

---

1. Display the record for which you want to enter a reading.
2. From the Select Action menu, select Enter Meter Readings.
3. To enter a meter reading, select either of the following options:
  - To enter a meter reading for the asset, click the Asset Meter Readings tab.
  - To enter a meter reading for the location, click the Location Meter Readings tab. If the asset and location have meters, and the asset inherits the meter reading for the location, enter a reading for either the asset or the location. If the asset has child records that inherit meter readings, the meter readings for the child records are updated. If the location has assets that inherit meter readings for the location, the readings for the assets in that location are updated.
4. In the New Reading field, enter a value, or click Select Value. The system date and time display in the New Reading Date field. The log in name for the user displays in the Inspector field.
5. To change the inspector, specify a value, or click Detail Menu to retrieve a value.
6. To enter the reading and return to the record, click OK.

---

## Enabling preventive maintenance alerts for work orders

You can use preventive maintenance alerts to notify you of pending preventive maintenance work that is scheduled for assets or locations in work order records.

## About this task

---

The site that is listed on the work order must be configured to enable alerts. You configure preventive maintenance alerts for sites in the Organizations application.

## Procedure

---

1. In the Organizations application, select the PM Options action and specify a status that work orders must reach to generate preventive maintenance alerts.
2. In the Preventive Maintenance application, create a preventive maintenance record for an asset or for a location.
3. In the Work Order Tracking application, create a work order that requires the same asset or location. Preventive maintenance alerts are shown when the status of the work order record reaches the status that you have specified.

---

## Reporting downtime for assets

You can report the start time and the end time of the downtime for an asset after it has occurred.

## About this task

---

You can create multiple downtime reports for a single work order.

## Procedure

---

1. Display the record with the asset for which you want to report downtime.
2. Select the Report Downtime action.
3. In the Downtime Report section, select the Report Downtime option.
4. Specify the date the downtime began, or select one of the following options in the Start Date Default section:
  - Reported Date - the date and time the downtime for the asset was reported on the work order.
  - Actual Start Date - the date and time the downtime for the asset actually began.
  - None - no default start date and time.
5. Enter a date the downtime ended or will end.
6. In the Hours field, the system calculates the total downtime hours based upon the start date and the end date. This calculation considers the calendar for the asset. The calculation also considers the elapsed time between the start of downtime, and the end of downtime.
7. In the Downtime Code field, click Select Value to select a code.
8. In the Downtime Type section, select either of the following options:
  - Operational - if the down time occurred when the asset is normally in use
  - Non-Operational - if the down time occurred when the asset is normally not in use.
9. Click OK to report the downtime and return to the record.

## Swapping assets

---

You can swap assets associated with a work order. The swap action applies to the work order and all of the assets, locations, and configuration items on its child work orders. The term "work order" can refer to a work order, change, release, or activity record.

## Before you begin

---

You can execute the swap immediately, or you can save the swap as a plan. If you save the swap as a plan, the changes will apply when the status for the work order is COMP (Complete). When the status of a work order is COMP, you swap assets only using the Execute Now option. When you select Execute Now on any tab, the system executes the changes on all tabs.

When you duplicate a work order that has a planned swap to its assets or locations, the planned action does not get copied to the duplicate work order. Also, when you create a release, or change, or work order from a record using the Select Action menu option, the planned action is not copied to the follow-up record.

## Procedure

---

1. Select the Move/Swap/Modify action.
2. Click the Move/Swap tab.
3. Select the Is this an Asset Swap checkbox.
4. In the Swap Assets section, select the row for the asset you want to swap.
5. To move the asset to a parent or location, type a value in the appropriate field, or click Select Value to retrieve a value.
6. In the Replacement Asset field, specify an asset, or click Select Value to retrieve a value.
7. Perform one of the following actions:
  - To swap the assets immediately, click Execute Now.
  - To swap the assets when the status for the work order is COMP (Complete), click Save as Plan.

## Categorizing work orders with classifications and attributes

---

To simplify the process of finding and managing records, you can categorize work orders. Classifications identify work orders as involving a type of item, such as a notebook. Attributes further identify the item by providing more details. For example, a notebook can have the attributes memory, speed, and disk space.

## Procedure

---

1. In the Work Order Tracking application, display the work order that you want to categorize.
  2. On the Specifications tab, specify a classification.
  3. Select the attributes.
  4. Save your changes.
- [Categorizing work order tasks with classifications and attributes](#)  
To simplify the process of finding and managing records, you can categorize work order tasks. Categorizing work order tasks involves classifying and adding and changing attributes to further group the classification.

## Categorizing work order tasks with classifications and attributes

---

To simplify the process of finding and managing records, you can categorize work order tasks. Categorizing work order tasks involves classifying and adding and changing attributes to further group the classification.

---

## Procedure

1. In the Work Order Tracking application, display the work order with the task that you want to categorize.
2. In the Job Details section of the Plans tab, select the task that you want to categorize.
3. Specify the classification.
4. Optional: You can add attributes, delete attributes, and change the values of the attributes in the row details.
5. Save the work order.

---

## Example

A work order task involves the classification of a notebook. The notebook classification has the attributes of memory, speed, and disk space, which are copied to the work order upon classification. As needed, you can add attributes such as operating system and power, change the attribute values, and remove attributes associated with the work order.

---

## Setting up work process flows

Work process flows use relationships between work orders and tasks to automate the flow of status changes. You set relationships between work orders and tasks so that when a task is completed, the next task in the flow can be initiated.

---

## Before you begin

To set the process flow for individual tasks, you must select Under Flow Control at the header level for the work order.

---

## About this task

The best practice for consistently using the flow feature is to set up the process flow as a work template at the job plan level.

---

## Procedure

1. Open the work order.
  2. Select Under Flow Control.
  3. On the Plans tab, display the details for the task.
  4. In the Scheduling Information section, next to the Predecessors field, click the Detail Menu icon.
  5. Select the tasks that must be completed before this task is initiated.
  6. Save the work order.
- [Defining flow actions](#)  
A flow action is used in a work process flow to define certain actions that should occur while work is being done. Actions or action groups can be applied to any work order, task, or job plan task.
  - [Removing work process flow from work orders or job plans](#)  
You can remove work process flow for a work order, a job plan, or task records that have it defined. You can do this at the header level, which will remove it for all the associated tasks as well, or you can remove it at the task level.
  - [Suspending work process flows](#)  
You can suspend the work process flow for work order or task records that have it defined. For example, if you want to start a work order or task manually, you could suspend the flow control on that record. The flow remains suspended until you remove the suspension.
  - [Stopping workflow processes](#)  
You can stop a workflow process for a record. You use the Workflow Administration application to view and stop workflow processes.

---

## Defining flow actions

A flow action is used in a work process flow to define certain actions that should occur while work is being done. Actions or action groups can be applied to any work order, task, or job plan task.

---

## About this task

You can determine whether the action takes place automatically, or if the action only takes place when it is initiated manually. When automatic, the action takes place as soon as the work order or task status is changed to an in progress (INPRG) status value by work process flow. When manual, you must initiate the flow action by running the automation or processing scripts or placing an action button on the target application. Actions and action groups are defined in the Actions application.

---

## Procedure

1. In an application that supports flow action, display the record for which you want to define a flow action.
2. Perform one of the following actions:

- For a work order, change, release, or job plan record, enter a value in the Flow Action field on the application tab.
- For a work order or job plan task, enter a value in the Flow Action field in the Task table window. The Tasks table window is found on the main tab of the Job Plans application, or the Plans tab of the Work Order Tracking, Changes, and Releases applications.

The defined action runs when the work order or task status value is changed to INPRG.

3. Specify whether you want the flow action to be automatically run:

Option	Flow Action Assist
Automatically run the flow action	Cleared
Manually run the flow action	Selected

4. Click Save record.

---

## Removing work process flow from work orders or job plans

You can remove work process flow for a work order, a job plan, or task records that have it defined. You can do this at the header level, which will remove it for all the associated tasks as well, or you can remove it at the task level.

### About this task

If work process flow is removed at the header level, it will automatically be removed on individual tasks on the record. You cannot retain work process flow for a task that does not have it set at the header level.

### Procedure

1. In an application that supports flow action, display the record that you want to remove from work process flow.
2. On the main application tab, clear the Flow Controlled check box. The system removes the work order or the job plan, and all of its tasks from work process flow.
3. Click Save Record.

---

## Suspending work process flows

You can suspend the work process flow for work order or task records that have it defined. For example, if you want to start a work order or task manually, you could suspend the flow control on that record. The flow remains suspended until you remove the suspension.

### Before you begin

Removing the suspension restarts the flow. Any successor work orders or tasks with completed predecessors continue the process. Work orders and tasks without predecessors continue the process at the same time as the parent record. The last completed child under a parent rolls its completion up to the parent.

### Procedure

1. In an application that supports flow action, display the record on which you want to suspend flow control.
2. On the main application tab, at the header level, select the Suspend Flow Control check box. The system suspends the work process flow on the work order and on all of its tasks.
3. To retain flow control for individual tasks, display the tasks in the Tasks table window, and clear the Suspend Flow Control check box at the task level. Flow control remains in place at the task level. This action does not affect the suspension at the work order header level. You can find the Tasks table window on the Plans tab.
4. Click Save Record.

### Example

You generally suspend a set of tasks, often under the same parent. For example, you can delay the automatic starting of one whole phase of work until a certain condition has been met. You can also delay starting a phase of work to make changes to the tasks, such as inserting tasks, deleting tasks, and changing the precedence logic.

---

## Stopping workflow processes

You can stop a workflow process for a record. You use the Workflow Administration application to view and stop workflow processes.

### Before you begin

The application associated with the workflow process record must be enabled for workflow.

### Procedure

1. To stop a workflow process, complete one of the following steps:
  - In a Workflow-enabled application, display the record you want to remove from Workflow. Select the Stop Workflow action.
  - In the Workflow Administration application, select the active process that you want to stop. Click Stop Process on the assignment line.
2. Optional: Create an e-mail notification. The system defaults to the WFSTOP communication template. You can use the WFSTOP communication template to create the notification. You can also manually specify the subject, message, and role recipients.
3. Click OK. The system stops the workflow process. The system also sends any notifications.

---

## Changing the status of a list of records

You can change the status of multiple records in applications.

### Procedure

---

1. In the Work Order application, on the List tab of an application, filter the records so that less than 200 records are displayed.
2. Scroll down the bottom of the screen and select the Select Records check box.  
The screen refreshes and each row now has a check box.
3. Select the check boxes for the work orders whose status you want to change.
4. Click the Change Status action and enter the information in the dialog box.
5. Click OK to close the Change Status window.

---

## Labor Reporting

You use the Labor Reporting application to report the type and the total number of hours of work that external contractors or internal employees performed.

The Labor Reporting application contains a single window that displays labor transaction records. Use the Transactions table window to perform the following actions:

- Create labor transactions.
- Modify labor transactions.
- Delete labor transactions.
- Approve labor transactions.
- Invoice labor transactions.

You can also create labor transactions in other applications by using the ticket timer features.

- [Working with labor reports](#)  
You use the Labor Reporting application to report the type and the total number of hours worked. You can create, modify, delete, approve, and invoice labor transactions.

---

## Working with labor reports

You use the Labor Reporting application to report the type and the total number of hours worked. You can create, modify, delete, approve, and invoice labor transactions.

- [Creating labor transactions](#)  
As work is done to complete a work order, you create labor transactions in the Labor Reporting application to record the work. You can enter labor transactions by labor, by vendor/contract, by work order, or by ticket.
- [Reporting work hours by work order](#)  
You use the Labor Reporting application to specify work hours by work order. Reporting hours by work order is useful when you have a stack of work orders to report. You enter transactions for work orders whose status is not WAPPR (Waiting for Approval), CAN (Canceled), or CLOSE (Closed).
- [Reporting work hours by labor code](#)  
Use the Labor Reporting application in the Work Orders module to specify work hours by labor code, tracking the time spent on specific tasks. You also can record daily attendance for each labor code.
- [Reporting work hours by ticket](#)  
When you report labor hours, you can report them by ticket. You can specify a ticket and report all the labor transactions for that ticket. When you report labor hours by ticket, the asset, location, and start date are copied from the ticket.
- [Specifying labor transactions by contract/vendor](#)  
When you have work performed by a vendor or by an outside contractor, you can specify labor transactions by vendor. The contract and vendor association are validated.
- [Recording daily attendance](#)  
You can record daily attendance when you specify labor transactions by work order, by ticket, by labor, or by contract/vendor.
- [Creating invoices](#)  
Your invoices can consolidate the labor transactions by work order or can list each transaction on its own line. When you create invoices for multiple labor transactions with different vendors, a separate invoice is created for each vendor.
- [Creating key performance indicators](#)  
You create key performance indicators to track critical performance variables over time.

---

## Creating labor transactions

As work is done to complete a work order, you create labor transactions in the Labor Reporting application to record the work. You can enter labor transactions by labor, by vendor/contract, by work order, or by ticket.

### Procedure

---

1. In the Labor Reporting application, in the Transactions table window, click New Row.
2. Specify the details of the labor record.
3. Save the record.

---

## Reporting work hours by work order

You use the Labor Reporting application to specify work hours by work order. Reporting hours by work order is useful when you have a stack of work orders to report. You enter transactions for work orders whose status is not WAPPR (Waiting for Approval), CAN (Canceled), or CLOSE (Closed).

### Procedure

---

1. In the Labor Reporting application, select the Enter By Work Order action.
2. Specify the work order number.
3. Optional: Specify the task number.
4. Create a row for each labor transaction that was required for the work order.
5. Save the record.

---

## Reporting work hours by labor code

Use the Labor Reporting application in the Work Orders module to specify work hours by labor code, tracking the time spent on specific tasks. You also can record daily attendance for each labor code.

### Procedure

---

1. In the Labor Reporting application, select the Enter By Labor action.
2. In the Labor field, specify a value.
3. Specify the details for the hours worked.
4. Save the record.

---

## Reporting work hours by ticket

When you report labor hours, you can report them by ticket. You can specify a ticket and report all the labor transactions for that ticket. When you report labor hours by ticket, the asset, location, and start date are copied from the ticket.

### Procedure

---

1. In the Labor Reporting application, select the Enter By Ticket action.
2. Specify the ticket number.
3. Create a row for each labor transaction that was required for the ticket.
4. Specify the details for the transaction, including key fields such as the labor, craft, hours, and start and end dates.
5. Save the record.

---

## Specifying labor transactions by contract/vendor

When you have work performed by a vendor or by an outside contractor, you can specify labor transactions by vendor. The contract and vendor association are validated.

### Procedure

---

1. In the Labor Reporting application, select the Enter By Contract/Vendor action.
2. Specify either the vendor name or contract number.
3. Click New Row.
4. Specify the details of the labor transaction.

5. Save the record.

---

## Recording daily attendance

You can record daily attendance when you specify labor transactions by work order, by ticket, by labor, or by contract/vendor.

### Procedure

---

1. In the Labor Reporting application, select the Daily Attendance action.
2. In the Daily Attendance window, click New Row.
3. Select the labor or the craft whose attendance you want to record.
4. Specify the details for the attendance record.
5. Click OK.
6. Save the record.

---

## Creating invoices

Your invoices can consolidate the labor transactions by work order or can list each transaction on its own line. When you create invoices for multiple labor transactions with different vendors, a separate invoice is created for each vendor.

### Procedure

---

1. In the Labor Reporting application, in the Transactions table window, select the Select Records check box.
2. Select each labor transaction for which you want to create an invoice.
3. Select the Create Invoice action.
4. Enter the details for the invoice in the Create Invoice window.
5. Optional: Select or clear the Consolidate by Work Order check box for each transaction to either consolidate them or create separate invoices.
6. Click OK to create the invoice.

---

## Creating key performance indicators

You create key performance indicators to track critical performance variables over time.

### Procedure

---

1. In the Key Performance Manager application, click New KPI.
2. Provide a unique name for the key performance indicator.
3. Optional: Provide a description of the key performance indicator.
4. Specify either decimal or percentage as the calculation type.
5. Specify the selection criteria.
6. In the Query Details section, specify the KPI query.
7. To change the graph from green to yellow to red, in the KPI Parameters section, specify values in the Target field, Caution At field, and Alert At field.  
If you want a low number, specify a low value in the Target field and a high value in the Alert At field. If you want a high number, specify a high value in the Target field and a low value in the Alert At field.
8. If you want everyone to have access to the KPI, select the Public? checkbox.
9. Optional: Specify values for linking the key performance indicator.
10. Save the key performance indicator.

---

## What to do next

If you want to restrict who can see the KPI, from the Security tab, specify the security groups that have access to the KPI.

---

## Quick Reporting

You use the Quick Reporting application to plan, to review, and to approve work orders for assets and locations. When you create a work order, you initiate the maintenance process and create a historical record of the work being performed.

You use the Quick Reporting application to perform the following additional functions:

- Create work orders, view work orders, and modify work orders.
- View preventive maintenance and scheduling information.
- See which job plan and safety plan are applied.
- Report actual labor, materials, and tool use.
- View and enter failure information.

- View the originating work order for a follow-up work order.
- [Quick reporting overview](#)  
As work progresses on your work orders, you can change the status, report actuals, and enter failure information. You can also view costs and create relationships between records.
- [Working with quick reporting](#)  
When you create a work order, you initiate the maintenance process and create a historical record of the work being performed.

---

## Quick reporting overview

As work progresses on your work orders, you can change the status, report actuals, and enter failure information. You can also view costs and create relationships between records.

- [Costs on tickets and work orders](#)  
You can view the estimated and actual costs for a single work order or ticket, including costs for labor, material, tools, and services. You can also view total costs for the current record and all the records below it in its hierarchy.
- [Work order statuses](#)  
The status of a work order indicates its position in the processing cycle. The status determines which actions can be performed on the work order. For example, if the work order is approved, it has a status of APPR and the tasks can begin.
- [Record relationships](#)  
Relationships between records, such as tickets and work orders, help simplify record management. You can create record relationships manually, or relationships might be created automatically when you take certain actions.
- [Preventive maintenance alert information](#)  
The PM Alert message is a system-generated message that notifies you of pending preventive maintenance work when an asset is being repaired or a work order is generated against a location.
- [Rules for deleting work orders](#)  
You use the Quick Reporting application to delete a work order under specific conditions. When you delete a work order, you can elect whether to delete the associated child work orders.

---

## Costs on tickets and work orders

You can view the estimated and actual costs for a single work order or ticket, including costs for labor, material, tools, and services. You can also view total costs for the current record and all the records below it in its hierarchy.

When you view the costs of a ticket or work order, the data is displayed in two tables:

- The Totals table displays the costs for a single ticket or work order.
- The View Hierarchy Grand Totals table displays the costs for the current ticket or work order and all records under its hierarchy.

Each table presents the same information, which is shown in the following table.

Column	Explanation
Current Estimate	Displays read-only calculated values for the current totals from the Labor, Materials, Standard Services, and Tools tabs of the Plans tab for the ticket or work order.
Estimate at Approval	Is set to zero until the work order is approved, then the values are copied from the Current Estimate column and are read-only. If the work order status changes from approved to unapproved, then these fields are cleared. The estimated costs at approval are not affected by the change in status from in progress to completed or closed.
Actual	Displays the read-only values from the Labor (for approved labor only), Materials, and Tools tabs of the Actuals tab. If the status of the record changes from approved, then these fields are not cleared.

---

## Rolling up maintenance costs

After you close a work order that is associated with an asset, you can calculate your maintenance costs by rolling up costs that you incur for labor, materials, tools, and services to the top-level asset in the hierarchy that the asset belongs to.

Costs can be rolled up manually or automatically. By default, cost rollups are manual. If you want costs to be calculated and rolled up automatically when a work order is closed, you must set the `mxe.workorder.rollupMaintenanceCosts` system property to 1. After you configure the system property for automatic rollups, all subsequent costs that are associated with work orders are rolled up automatically. However, any unprocessed maintenance costs that existed before the configuration are not automatically rolled up. You must roll up any preexisting, unprocessed maintenance costs manually.

To calculate the maintenance cost of your assets, use the Roll Up Maintenance Costs action in the Assets application.

If you upgrade to Maximo® Manage 8.5, run the Asset Cost Rollup Report to roll up pending maintenance costs before the upgrade.

---

## Work order statuses

The status of a work order indicates its position in the processing cycle. The status determines which actions can be performed on the work order. For example, if the work order is approved, it has a status of APPR and the tasks can begin.

WAPPR

	The work order is waiting for approval. WAPPR is the default status for work orders that are created in the Work Order Tracking, Changes, Releases, and Activities applications.
APPR	The work order is approved and the work can begin.
WSCH	The work order is waiting to be scheduled. WSCH is the default status for work orders that are created in the Preventive Maintenance application.
WMATL	Materials must arrive before the work can be performed.
WPCOND	The work can be performed only when the condition of the plant is suitable. For example, certain work might require that the plant is shut down.
INPRG	The work is in progress. INPRG is the default status for work orders that are created in the Quick Reporting application.
COMP	The physical work is completed.
CLOSE	The work order is closed. Inventory reservations for items that were not used for the work listed on the work order are removed, and the work order becomes a history record.
CAN	The work order is canceled. You cannot cancel a work order if the work is already in progress or if actuals are already reported.
HISTEDIT	The work order was edited in history.

## Effects of changing work order statuses

Work orders can be controlled by a workflow process, which can lead to automatic status changes.

Child work orders can inherit status changes from their parent. Inheritance of status changes is controlled by the Inherit Status Changes check box.

If you are using process flow control, you can ensure that the status is inherited from the parent work order to the child work order. To allow status inheritance, you must activate the `mxe.app.wo.flowControlStatusInheritance` setting in the System Properties application. Two statuses can never be inherited with process flow control; the Flow Start and Flow Complete statuses. Flow Start and Flow Complete are INPRG and COMP, by default. You can change the default status settings in the Organizations application, by selecting Work Order Options > Work Type and specifying values for the start status and the complete status.

The following table shows the effects of changing the status of a work order.

Change to status	Effects
APPR (Approved)	<ul style="list-style-type: none"> <li>The work plan items are reserved in the Inventory application and in the cost and rate data.</li> <li>Rates can be changed in the Inventory application, the Labor application, or the Tools application. If the rates change, the work plan reflects the rates in effect when the work order was approved.</li> <li>You can no longer delete the work order.</li> </ul>
CAN (Canceled)	<ul style="list-style-type: none"> <li>Work orders that are not started are canceled.</li> <li>Work orders that have no actuals reports are also canceled.</li> <li>Canceled work order become history records.</li> </ul>
CLOSE (Closed)	<ul style="list-style-type: none"> <li>The work order is finalized.</li> <li>Inventory reservations for unused items on the work order are removed.</li> <li>The work order becomes a history record.</li> </ul>
COMP (Completed)	<ul style="list-style-type: none"> <li>All physical work that is associated with a work order is finished.</li> <li>If you planned to move or modify an asset on the work order, the move or modification occurs when the status is changed to COMP.</li> </ul>
INPRG (In Progress)	<ul style="list-style-type: none"> <li>Physical work on the work order is currently in progress.</li> </ul>

## Allowed changes to work order statuses

The following table shows the possible changes to the status of a standard work order. However, process flow control can restrict which status changes are possible.

Status	New status options
WAPPR	<ul style="list-style-type: none"> <li>INPRG</li> <li>CAN</li> <li>WMATL</li> <li>COMP</li> <li>WPCOND</li> <li>APP</li> <li>CLOSE</li> </ul>

Status	New status options
APPR	<ul style="list-style-type: none"> <li>• INPRG</li> <li>• WMATL</li> <li>• COMP</li> <li>• WPCOND</li> <li>• WAPPR</li> <li>• CAN</li> <li>• CLOSE</li> </ul>
WSCH	<ul style="list-style-type: none"> <li>• INPRG</li> <li>• WMATL</li> <li>• COMP</li> <li>• WPCOND</li> <li>• WAPPR</li> <li>• CAN</li> <li>• CLOSE</li> </ul>
WPCOND	<ul style="list-style-type: none"> <li>• INPRG</li> <li>• WMATL</li> <li>• COMP</li> <li>• WPCOND</li> <li>• WAPPR</li> <li>• CAN</li> <li>• CLOSE</li> </ul>
WMATL	<ul style="list-style-type: none"> <li>• INPRG</li> <li>• COMP</li> <li>• WPCOND</li> <li>• WAPPR</li> <li>• CAN</li> <li>• CLOSE</li> </ul>
INPRG	<ul style="list-style-type: none"> <li>• WMATL</li> <li>• COMP</li> <li>• WAPPR</li> <li>• CLOSE</li> </ul>
COMP	CLOSE
CAN	None.
CLOSE	HISTEDIT

## Related reference

---

- [Workflow properties](#)

## Record relationships

Relationships between records, such as tickets and work orders, help simplify record management. You can create record relationships manually, or relationships might be created automatically when you take certain actions.

The types of relationships that can exist between records include:

- Related relationship, which is an informal association of tickets that is used for informational purposes.
- Originator and Follow-up, which keep costs hierarchies separate while still creating a relationship between the tickets.
- Related to Global, which creates a relationship in which the tickets are related to a global issue, which affects many users.

## Related records

---

Using any ticket or work-based application, you can view similar records and relate tickets and work orders to the current record. A related relationship between records is an informal relationship that is for informational purposes only.

A related relationship does not affect status inheritance, affect workflow, or follow a set of business rules. Related relationships can be many-to-many, and do not represent record hierarchies. By relating records informally, you can navigate to related records, view related information for similar records, and view open tickets that are associated with a field. You can create an informal record relationship in the following ways:

- Use the Related Records tab of the application. This tab provides an easy way to create relationships and to view and navigate among informally related records.
- Use the Show Similar Tickets action in any ticket application. The similar ticket search results only include the service requests, incidents, and problems that have the same classification as the current ticket. Global records and history records are not included in the results. Your system administrator might add more restrictions to the search results.

## Originator and follow-up tickets and work orders

---

You can relate tickets and work orders to a record more directly when you create a follow-up record from the ticket using one of the Create actions on the ticket. The ticket you create the follow-up record from is the originator. A follow-up record can be a ticket or a work order. In some cases, a follow-up ticket or work order might be able to change the status of its originating ticket. An originating ticket cannot change the status of a follow-up work order, nor can a follow-up ticket change the status of the originator if there is more than one follow-up. These options are configured by the system administrator.

## Globally related tickets

---

A global ticket is an incident or problem relating to an issue that affects many users. You can relate tickets, including service requests, to a global ticket, which creates a RELATEDTOGLOBAL relationship. This relationship lets you manage the tickets by using the global ticket. When you change the status of the global ticket, the system changes the status of all globally related tickets.

If your administrator has set up automated notifications of status changes, the system changes the status of the tickets related to the global issue. For example, all the initial requestors reporting the same issue are notified of its resolution. On the global ticket, you can also view a list of related records and view the work and communication logs for all related records.

- [Deletion of record relationships](#)

On the Related Records tab, you can delete the relationship between a change and any related work orders or tickets.

- [Global records](#)

A global record is a ticket that is a root cause of other issues or that affects many users, such as computer network failures or flooding in a building. After you mark a record as global, you can relate multiple tickets and then manage all tickets using the global record.

---

## Preventive maintenance alert information

The PM Alert message is a system-generated message that notifies you of pending preventive maintenance work when an asset is being repaired or a work order is generated against a location.

The PM Alert message helps reduce downtime by letting you perform upcoming routine maintenance while performing non-routine repairs. In order for the PM Alert message to be displayed, the preventive maintenance must have its Alert check box selected and the site must be set up to display alerts.

When a corrective maintenance work order reaches the status specified in PM Options in the Organizations application and the asset or location has pending preventive maintenance, then the PM Alert window displays when either of the following criteria is met:

- The system date is on or after the Estimated Next Due Date minus the Alert Lead. For example, if the system date is May 25, and the Estimated Next Due Date is June 1 and the Alert Lead is 10 days, the PM Alert message displays. The message displays from May 23 through June 1.
- The current meter reading for the asset or the location is greater than the Next Meter Reading projection minus the Alert Lead. For example, if the last meter reading for the asset was 975 units, and the Next Meter Reading is 1,000 units and the Alert Lead is 50 units, the PM Alert message displays. The message displays when the meter reading is at least 950.

---

## Rules for deleting work orders

You use the Quick Reporting application to delete a work order under specific conditions. When you delete a work order, you can elect whether to delete the associated child work orders.

If you want to delete a work order and its child work orders, then the work order and its children must meet the following criteria:

- They must have a status of Waiting for Approval (WAPPR).
- They must not have any transactions registered against them, except for Work Order Status (WOSTATUS).
- They must not have any actuals reported against them.
- They must not have any labor assignments associated with them.
- They must not have any measurements or meter readings taken against them.
- They must not have been generated for a purchase order or for a receipt.
- They must not have any failures reported against them.
- They must not be in Workflow, or ever have been in Workflow.
- They cannot have been created by a Preventive Maintenance generation.
- They cannot be in follow-up work or have follow-up work in progress.

---

## Working with quick reporting

When you create a work order, you initiate the maintenance process and create a historical record of the work being performed.

- [Creating work orders for quick reporting](#)

You can use the Quick Reporting application to create a work order for a location, for an asset, or for a General Ledger account.

- [Applying routes to work orders](#)

You can apply a route to a work order to define a list of related work assets. For example, you can define assets, locations, or a combination of both; each of which is considered to be a stop along the route. The work assets can be related by location, such as all pumps and motors in a room. Or they can be related by the type of asset, such as all fire extinguishers at a site.

- [Reporting actuals for work orders](#)

As work progresses on an approved work order, you can report the actual labor hours, materials, services, and tools used.

- [Specifying meter readings on work orders](#)

You can enter meter readings for the asset and the location on a work order. An asset can be set up to inherit the meter readings of its parent asset or its

location.

- [Reporting downtime for assets](#)

You can report the start time and the end time of the downtime for an asset after it has occurred.

- [Swapping assets](#)

You can swap assets associated with a work order. The swap action applies to the work order and all of the assets, locations, and configuration items on its child work orders. The term "work order" can refer to a work order, change, release, or activity record.

- [Assigning a parent to a work order](#)

You can assign a parent to a work order and assign tasks to that parent. When you assign work order records to a parent, they become child work orders records of the parent record.

- [Changing the status of a list of records](#)

You can change the status of multiple records in applications.

---

## Creating work orders for quick reporting

You can use the Quick Reporting application to create a work order for a location, for an asset, or for a General Ledger account.

### Procedure

---

1. In the Quick Reporting application, click the New Work Order icon.
2. If the work order is for a location, type its identifier in the Location field.
3. If the work order is for an asset, type its identifier in the Asset field.
4. To charge the work order to a General Ledger account, type its identifier in the GL Account field.
5. Specify the details of the work order.
6. Save the record.

- [Completing work orders](#)

You use the Quick Reporting application to change the status of one or more selected work orders to Completed (COMP) status. The Completed status indicates that all the physical work associated with a work order is finished.

---

## Completing work orders

You use the Quick Reporting application to change the status of one or more selected work orders to Completed (COMP) status. The Completed status indicates that all the physical work associated with a work order is finished.

### Procedure

---

1. In the Quick Reporting application, on the List tab, select the Select Records check box.
2. Select the records you want to complete.
3. Select the Change Status action.
4. Set the status to Completed.
5. Optional: Modify the date in the Status Date field, and add a note to the Memo field.
6. Click OK.

---

## Applying routes to work orders

You can apply a route to a work order to define a list of related work assets. For example, you can define assets, locations, or a combination of both; each of which is considered to be a stop along the route. The work assets can be related by location, such as all pumps and motors in a room. Or they can be related by the type of asset, such as all fire extinguishers at a site.

### About this task

---

Each route stop can have its own job plan, which the system copies to the child work order. You can apply a route to a work order in the Work Order Tracking and Quick Reporting applications.

### Procedure

---

1. Open an application and display the work order record that you want to update.
2. Select the Apply Route action.
3. Select the route that you want to apply to the work order.  
A message box opens and displays a list of child work orders that are created from the route.
4. Click Save Work Order.

### Results

---

The created child work orders display as route stops on the Plans tab in the Work Order Tracking application.

---

## Reporting actuals for work orders

As work progresses on an approved work order, you can report the actual labor hours, materials, services, and tools used.

### Procedure

---

1. Display the work order for which you want to report actuals.
2. On the Actuals tab, enter the details on the following subtabs:

Option	Description
<b>Labor</b>	Report hours for labor, copy labor from the work plan, or select planned labor.
<b>Materials</b>	Select materials, select reserved items, and select spare parts.
<b>Services</b>	Select services or standard services.
<b>Tools</b>	Select tools, copy tool data from the work plan, or select tools that were issued to the work order.

3. Save the record.

---

## Specifying meter readings on work orders

You can enter meter readings for the asset and the location on a work order. An asset can be set up to inherit the meter readings of its parent asset or its location.

### About this task

---

To find out if an asset is inheriting meter readings, go to the asset record and check the value in the Accept Rolldown From field.

### Procedure

---

1. Display the record for which you want to enter a reading.
2. From the Select Action menu, select Enter Meter Readings.
3. To enter a meter reading, select either of the following options:
  - To enter a meter reading for the asset, click the Asset Meter Readings tab.
  - To enter a meter reading for the location, click the Location Meter Readings tab. If the asset and location have meters, and the asset inherits the meter reading for the location, enter a reading for either the asset or the location. If the asset has child records that inherit meter readings, the meter readings for the child records are updated. If the location has assets that inherit meter readings for the location, the readings for the assets in that location are updated.
4. In the New Reading field, enter a value, or click Select Value. The system date and time display in the New Reading Date field. The log in name for the user displays in the Inspector field.
5. To change the inspector, specify a value, or click Detail Menu to retrieve a value.
6. To enter the reading and return to the record, click OK.

---

## Reporting downtime for assets

You can report the start time and the end time of the downtime for an asset after it has occurred.

### About this task

---

You can create multiple downtime reports for a single work order.

### Procedure

---

1. Display the record with the asset for which you want to report downtime.
2. Select the Report Downtime action.
3. In the Downtime Report section, select the Report Downtime option.
4. Specify the date the downtime began, or select one of the following options in the Start Date Default section:
  - Reported Date - the date and time the downtime for the asset was reported on the work order.
  - Actual Start Date - the date and time the downtime for the asset actually began.
  - None - no default start date and time.
5. Enter a date the downtime ended or will end.
6. In the Hours field, the system calculates the total downtime hours based upon the start date and the end date. This calculation considers the calendar for the asset. The calculation also considers the elapsed time between the start of downtime, and the end of downtime.
7. In the Downtime Code field, click Select Value to select a code.
8. In the Downtime Type section, select either of the following options:
  - Operational - if the down time occurred when the asset is normally in use
  - Non-Operational - if the down time occurred when the asset is normally not in use.
9. Click OK to report the downtime and return to the record.

---

## Swapping assets

You can swap assets associated with a work order. The swap action applies to the work order and all of the assets, locations, and configuration items on its child work orders. The term "work order" can refer to a work order, change, release, or activity record.

### Before you begin

---

You can execute the swap immediately, or you can save the swap as a plan. If you save the swap as a plan, the changes will apply when the status for the work order is COMP (Complete). When the status of a work order is COMP, you swap assets only using the Execute Now option. When you select Execute Now on any tab, the system executes the changes on all tabs.

When you duplicate a work order that has a planned swap to its assets or locations, the planned action does not get copied to the duplicate work order. Also, when you create a release, or change, or work order from a record using the Select Action menu option, the planned action is not copied to the follow-up record.

### Procedure

---

1. Select the Move/Swap/Modify action.
2. Click the Move/Swap tab.
3. Select the Is this an Asset Swap checkbox.
4. In the Swap Assets section, select the row for the asset you want to swap.
5. To move the asset to a parent or location, type a value in the appropriate field, or click Select Value to retrieve a value.
6. In the Replacement Asset field, specify an asset, or click Select Value to retrieve a value.
7. Perform one of the following actions:
  - To swap the assets immediately, click Execute Now.
  - To swap the assets when the status for the work order is COMP (Complete), click Save as Plan.

---

## Assigning a parent to a work order

You can assign a parent to a work order and assign tasks to that parent. When you assign work order records to a parent, they become child work orders records of the parent record.

### About this task

---

You cannot assign parent records to closed work order records. If the parent has a value in the Priority field, and the child or children work order records do not, the child or children work order records inherit the parent priority value.

### Procedure

---

1. Open an application and display the work order record that you want to update.
2. On the List tab, select the task that you want to update.
3. Select the Assign To New Parent action.
4. Select the work order record that you want as the new parent.  
The asset management system displays the parent work order number in the Parent WO field.
5. Click Save record.

---

## Changing the status of a list of records

You can change the status of multiple records in applications.

### Procedure

---

1. In the Work Order application, on the List tab of an application, filter the records so that less than 200 records are displayed.
2. Scroll down the bottom of the screen and select the Select Records check box.  
The screen refreshes and each row now has a check box.
3. Select the check boxes for the work orders whose status you want to change.
4. Click the Change Status action and enter the information in the dialog box.
5. Click OK to close the Change Status window.

---

## Assignment Manager

You use the Assignment Manager application to dispatch labor and schedule work for your organization.

Using the Assignment Manager application, you can view the requirements that were created from the work plan, as well as the unplanned work on a work order. You also can add new requirements to the work list.

You also can view work order assignments and associated craft, skill level, vendor, contract, and organization requirements. You can specify whether to view labor that applies to specific requirements, or to view work order requirements that fit the craft, skill level, vendor, contract, and organization requirements, calendar availability, or shift of displayed labor.

If a default labor query was selected in the Labor application, the labor list displays a filtered list of available labor codes. If there is no selected query, the Labor List displays all the labor in the database. To schedule labor codes, both a calendar and a shift must be specified on the person record in the People application.

To facilitate dispatching work assignments, the work list is color coded to indicate work requirements by priority. You can change the color choices and priority ranges to fit your business needs.

- [Work assignments overview](#)  
Work assignments dispatch labor and schedule work for your organization. You create and reassign work assignments using the Assignment Manager application.
- [Working with work assignments](#)  
Using the Assignment Manager application, you can view the requirements that were created from the work plan, as well as the unplanned work on a work order. You also can add new requirements to the work list.

---

## Work assignments overview

Work assignments dispatch labor and schedule work for your organization. You create and reassign work assignments using the Assignment Manager application.

- [Status of work assignments](#)  
In the Assignment Manager application, the status indicates the position of a work assignment within the work process flow.
- [Changes to labor availability for work assignments](#)  
In the Assignment Manager application, you can change the availability of labor for work assignments.
- [Priority preferences for work assignments](#)  
In the Assignment Manager application, you can manage the calculations for work priority and the response time for work priority for your work assignments.
- [Parameter preferences for work assignments](#)  
In the Assignment Manager application, you can manage the parameters of work assignments. For example, you can decide whether labor transactions are created when an assignment is interrupted or finished.

---

## Status of work assignments

In the Assignment Manager application, the status indicates the position of a work assignment within the work process flow.

The following statuses are used for work assignments:

### WAITASGN

When a work assignment is created, the status is set to waiting for assignment.

### ASSIGN

This status indicates that the assignment was assigned to a labor code. If you delete the labor code for this assignment, the status reverts to waiting for assignment.

### STARTED

This status indicates that the laborer has begun work on the assignment and actual labor transactions can be recorded. A laborer can start assigned work assignments only. The status of the work order is changed to in progress.

### INTERPT

This status indicates that an assignment that was started was interrupted before complete. Based on your preferences settings, actual labor transactions can be posted.

### COMPLETE

This status indicates that the work assignment is complete. After all assignments on a work order are completed, the work order is either closed or completed, depending on your parameter settings. If the work order is closed, the assignments for that work order are deleted and the status of the work order is set to close. If the work order is completed, the status of the work order is changed to complete. Based on your preferences settings, actual labor transactions can be posted.

Unplanned work orders can have work assignments without a status. After you assign the work assignment to a labor code, an assignment with a status of assigned is created.

---

## Changes to labor availability for work assignments

In the Assignment Manager application, you can change the availability of labor for work assignments.

To change the availability of labor for work assignments in the Assignment Manager application, click the Modify Availability icon for the labor code. The labor code must have an assigned calendar.

If a laborer is covering the shift for another laborer, you can add hours to the availability of the labor code. In addition, you can indicate when laborers are unavailable to be assigned to work.

---

## Priority preferences for work assignments

In the Assignment Manager application, you can manage the calculations for work priority and the response time for work priority for your work assignments.

You use the Set Priority Preferences action to change the work priority calculation and the work priority response times. The settings that you select affect all Work Orders applications.

By default, the calculated priority is displayed to determine the priority of an assignment. In the Assignment Manager application, you can use the Set Priority Preferences action to change the criteria that is used to calculate work priority.

You also can specify how soon individuals must respond to work orders of a given priority. When you create a work order, the response time is calculated relative to the system date or time.

---

## Parameter preferences for work assignments

In the Assignment Manager application, you can manage the parameters of work assignments. For example, you can decide whether labor transactions are created when an assignment is interrupted or finished.

Using the Set Parameter Preferences action in the Assignment Manager application, you can set the following preferences:

- How many rows are available in the Modify Availability window.
- Whether a labor transaction is created when an assignment is interrupted or finished.
- Whether to set the status of a finished assignment to close or complete.

If you change the status of a work order to close, all assignments for that work order are deleted. If you change the status of a work order to complete in another application, the status of assignments on that work order are changed to complete.

---

## Working with work assignments

Using the Assignment Manager application, you can view the requirements that were created from the work plan, as well as the unplanned work on a work order. You also can add new requirements to the work list.

- [Adding work assignments](#)  
To simplify the management of work assignments, you can add work assignments for your organization.
- [Specifying labor for work assignments](#)  
You can assign labor for work assignments by calendar or by labor codes. Algorithms determine optimal time distribution. For example, an assignment requires six hours of labor. If the selected labor code has only four hours available on one day, the remaining hours are assigned on the next available day.
- [Reassigning work assignments](#)  
To manage your work assignments, you can reassign planned work to a different labor code or a different time.
- [Assigning multiple work records to multiple labor codes](#)  
You can use the Assignment Manager application to assign and schedule a group of work records to a group of labor records, or labor codes, in bulk.

---

## Adding work assignments

To simplify the management of work assignments, you can add work assignments for your organization.

---

### Procedure

1. In the Assignment Manager application, add a new row.
2. Specify the details of the assignment.
3. Save the work assignment.

---

## Specifying labor for work assignments

You can assign labor for work assignments by calendar or by labor codes. Algorithms determine optimal time distribution. For example, an assignment requires six hours of labor. If the selected labor code has only four hours available on one day, the remaining hours are assigned on the next available day.

---

### Procedure

1. In the Assignment Manager application, select the work order to which you want to assign labor.
2. In the Work List section, select the assignments to which you want to assign labor.
3. In the Labor List section, locate the labor code for the laborer and specify the details of the assignment.
4. Save the record.

---

## Reassigning work assignments

To manage your work assignments, you can reassign planned work to a different labor code or a different time.

### Procedure

---

1. In the Assignment Manager application, in the Labor List section, find the labor record that you want to reassign.
2. Click the Show Assignments icon for the labor record.
3. In the Show Assignments window, change the assignment, which can include the following options:
  - To assign the work to another laborer, specify a new labor code.
  - To reschedule the work, specify a new scheduled start date.
  - To change the labor hours, specify a new value for the hours.
4. Save the record.

---

## Assigning multiple work records to multiple labor codes

You can use the Assignment Manager application to assign and schedule a group of work records to a group of labor records, or labor codes, in bulk.

### About this task

---

You can assign multiple work records to a team of laborers in order to increase efficiency. For example, if you have several unplanned jobs you can schedule a group of unassigned people to complete them all. Assigning multiple work records to a team of laborers creates an ad hoc team, because all selected labor people work on all selected jobs together.

### Procedure

---

1. In the Assignment Manager application, select the work records you want to assign to your labor team.
2. In the Work List table, select the records you want to assign out. Only work records with no status and with no craft associated with them can be assigned to more than one labor record at a time.
3. In the Labor List table, select the labor records to whom you want to assign the work.
4. Click Assign Labor. The work is assigned at the earliest possible date to all selected labor records. Or, to assign the work to be done on a certain day, click the date in the row for one of the labor records. If all selected labor records are not scheduled that day, the work is assigned to them on the next scheduled work day.
5. Click Save.  
The work records are updated to reflect the new assignments. If you specify labor it is assigned for the duration of the work. If no duration exists, the labor is assigned for one hour.

---

## Service Requests

You use the Service Requests application to manage requests for services that involve an asset or location in your enterprise. For example, you might receive a request to upgrade the computer software on the notebook for a user, or for all users at certain locations.

Service requests include requests that are communicated to you directly from a user, for example from a phone call, e-mail message, or direct contact. You also receive service requests from self-service users who create requests using the Create Service Request application. Other service requests might originate from an automated workflow process.

The owner of a service request is responsible for managing the ticket to completion. You can assign the ownership of a service request to another person or a workgroup. If you are the logged-in user, you can take ownership of the request and complete it yourself. You, or the assigned owner, can update the service request as more details are known about it.

For example, you can identify who the service affects and what priority it has. You can specify who the service request might be escalated to if issues arise and change the status of the request as it moves toward completion. You can apply service level agreements to the service request so that related legal and contact information is readily available. All communication that pertains to the service request can be stored in the log of the service request to provide a clear history of its lifecycle.

---

## Example of a service request that involve multiple assets and locations

A service request might involve a high-level task, such as installing graphic software on all the notebooks that belong to Product Managers. To complete this task, a service technician needs to know who the product managers are and where their notebooks are located. You can identify all this information using the features on the Service Request tab.

For example, you can identify `Project Managers' Notebooks` as the primary affected asset using the Service Request Details section. You can then identify each Product Manager and the location and details of each notebook using the Multiple Assets, Locations, and CIs section.

- [Service requests overview](#)  
A service request record captures information about a request, including the type of service, who needs it, where, when, and why. You use the Service Requests application to manage requests for services that involve an asset or location in your enterprise.

- [Working with service requests](#)

You can create service requests either in the Service Requests application or as records related to other tickets or work orders. You can apply service level agreements, categorize requests, create relationships with other records, assign and record labor activities, and log actions and communications.

---

## Service requests overview

A service request record captures information about a request, including the type of service, who needs it, where, when, and why. You use the Service Requests application to manage requests for services that involve an asset or location in your enterprise.

- [Service request management](#)

A service request captures information about the service being requested by a user, including the type of service that is needed, when it is needed, and why it is needed. Managing service requests involves creating, updating, assigning, escalating, and resolving requests for service on an asset or a location in your enterprise.

- [Service request templates](#)

A service request template contains predefined data that you can insert in common, high-volume service request records. Applying templates can significantly reduce the amount of time needed to create service requests.

- [Service level agreements](#)

A service level agreement (SLA) typically is a written agreement that outlines the commitment between a service provider and its customers. A commitment is a service level that all parties have agreed to, such as asset reliability or availability.

- [Record relationships](#)

Relationships between records, such as tickets and work orders, help simplify record management. You can create record relationships manually, or relationships might be created automatically when you take certain actions.

- [Service request categorization](#)

To simplify the task of retrieving and managing service requests, you can categorize the requests using classifications. Most classifications have attributes associated with them that group the classification further. You can add, change, or delete the attributes at any time, or you can reclassify the request to obtain a new set of attributes.

- [Ticket statuses](#)

Every ticket has a status that indicates its position as it moves toward completion. Changes to the ticket status can happen automatically or manually.

- [Costs on tickets and work orders](#)

You can view the estimated and actual costs for a single work order or ticket, including costs for labor, material, tools, and services. You can also view total costs for the current record and all the records below it in its hierarchy.

- [Linear segment details](#)

You use the Linear Segment Details section to locate a linear segment or point on a linear asset. The Linear Segment Details section, which displays on tabs in several applications, appears only if you are working with a linear asset.

- [Restrictions on deleting tickets](#)

You can delete a ticket only when it has a certain status and only when transactions have not been recorded for it.

---

## Service request management

A service request captures information about the service being requested by a user, including the type of service that is needed, when it is needed, and why it is needed. Managing service requests involves creating, updating, assigning, escalating, and resolving requests for service on an asset or a location in your enterprise.

A service request can be created and managed in several ways.

Method of service request creation	Description
Service Requests application	Used by service desk agents or users in a similar role, who are authorized to create and manage service requests.
Create Service Request application	Used by self-service users who are requesters who can register themselves on the system without the assistance of an agent, and create a service request. The request is then managed by an agent using the Service Requests application. Self-service users also can use the View Service Request application to view the status of their service request as it progresses toward completion.
Automatic	Your system administrator can configure the system to create service requests from sources such as e-mail, system monitoring tools, or external applications, and assign them to people or work groups for resolution.

---

## Service request templates

A service request template contains predefined data that you can insert in common, high-volume service request records. Applying templates can significantly reduce the amount of time needed to create service requests.

If you select and apply a template to a service request record, it overwrites existing data in the record. If there is data in a Service Request field but no data in the corresponding field on the template, the template does not delete the existing data. You can modify the applied information until the service request is in a resolved or closed status.

---

## Service level agreements

A service level agreement (SLA) typically is a written agreement that outlines the commitment between a service provider and its customers. A commitment is a service level that all parties have agreed to, such as asset reliability or availability.

The SLA describes one or more commitments and the escalation actions or notifications associated with each commitment. Escalation actions or notifications might be associated with an SLA to ensure that commitments are met. An escalation process can monitor all activities and send notifications or perform other activities to ensure that commitments are met.

The types of records to which service level agreements can be applied include tickets, such as service requests, and work-based records, such as work orders. Before you can apply an SLA to a record, the record must have a site defined.

A service level agreement can be associated with a record in several ways:

- An SLA might automatically be applied to a record from within a workflow or escalation process, or from another SLA.
- You can select an action to apply an SLA, which applies the best match automatically.
- You can view SLAs and select an action to select or clear the SLAs that you want to manually apply to the record.

When you apply a service level agreement to a record, the following events occur:

- The SLA Applied check box on the main tab of the record is selected to document the action.
- Any escalations that are associated with the SLA are activated.
- The Target Start, Target Finish, and Contact values for the record might be calculated automatically as follows:

Automatically calculated values
When an SLA is applied that includes a response commitment, the response commitment date populates the Target Start date field of the record.
When an SLA is applied that includes a resolution commitment, the resolution commitment date populates the Target Finish date field of the record.
When an SLA is applied that includes a contact commitment, the contact commitment date populates the Target Contact date field of the record.

---

## Record relationships

Relationships between records, such as tickets and work orders, help simplify record management. You can create record relationships manually, or relationships might be created automatically when you take certain actions.

The types of relationships that can exist between records include:

- Related relationship, which is an informal association of tickets that is used for informational purposes.
- Originator and Follow-up, which keep costs hierarchies separate while still creating a relationship between the tickets.
- Related to Global, which creates a relationship in which the tickets are related to a global issue, which affects many users.

---

## Related records

Using any ticket or work-based application, you can view similar records and relate tickets and work orders to the current record. A related relationship between records is an informal relationship that is for informational purposes only.

A related relationship does not affect status inheritance, affect workflow, or follow a set of business rules. Related relationships can be many-to-many, and do not represent record hierarchies. By relating records informally, you can navigate to related records, view related information for similar records, and view open tickets that are associated with a field. You can create an informal record relationship in the following ways:

- Use the Related Records tab of the application. This tab provides an easy way to create relationships and to view and navigate among informally related records.
- Use the Show Similar Tickets action in any ticket application. The similar ticket search results only include the service requests, incidents, and problems that have the same classification as the current ticket. Global records and history records are not included in the results. Your system administrator might add more restrictions to the search results.

---

## Originator and follow-up tickets and work orders

You can relate tickets and work orders to a record more directly when you create a follow-up record from the ticket using one of the Create actions on the ticket. The ticket you create the follow-up record from is the originator. A follow-up record can be a ticket or a work order. In some cases, a follow-up ticket or work order might be able to change the status of its originating ticket. An originating ticket cannot change the status of a follow-up work order, nor can a follow-up ticket change the status of the originator if there is more than one follow-up. These options are configured by the system administrator.

---

## Globally related tickets

A global ticket is an incident or problem relating to an issue that affects many users. You can relate tickets, including service requests, to a global ticket, which creates a RELATEDTOGLOBAL relationship. This relationship lets you manage the tickets by using the global ticket. When you change the status of the global ticket, the system changes the status of all globally related tickets.

If your administrator has set up automated notifications of status changes, the system changes the status of the tickets related to the global issue. For example, all the initial requestors reporting the same issue are notified of its resolution. On the global ticket, you can also view a list of related records and view the work and communication logs for all related records.

- [Deletion of record relationships](#)  
On the Related Records tab, you can delete the relationship between a change and any related work orders or tickets.
- [Global records](#)

A global record is a ticket that is a root cause of other issues or that affects many users, such as computer network failures or flooding in a building. After you mark a record as global, you can relate multiple tickets and then manage all tickets using the global record.

---

## Global records

A global record is a ticket that is a root cause of other issues or that affects many users, such as computer network failures or flooding in a building. After you mark a record as global, you can relate multiple tickets and then manage all tickets using the global record.

The following features, conditions, and restrictions pertain to using and managing global records:

- When you display a global record, and select the Show Similar Tickets action in the toolbar, you can view all tickets that are related to the global record. You also can select tickets and relate them to the global ticket.
- A record can be a global ticket or related to a global ticket, but not both.
- You can view the work and communication logs for all related records from the global record.
- If you change the status of a global record, the statuses of all globally related tickets change accordingly.
- Records that are created as follow-up records from the global record cannot be related to it as a global record.
- You cannot manage follow-up records from the global record.
- You cannot relate any record to a global record that is archived as a history record.
- You cannot designate a record as global if it is already related to a global record or it is a history record.
- You can remove the global flag from a global record that has tickets related to it, but you must first remove the value in the Related to Global ID field for each ticket that is related to the global record. You can do so using the Related Records tab of the global record.

---

## Service request categorization

To simplify the task of retrieving and managing service requests, you can categorize the requests using classifications. Most classifications have attributes associated with them that group the classification further. You can add, change, or delete the attributes at any time, or you can reclassify the request to obtain a new set of attributes.

For example, a service request might involve first classifying the request by technical area, such as hardware, software, or network. If a user selects the software classifications, further classifications might allow the specification of the exact software type and version.

You can specify values for the attributes. Classifying service requests also supports the integration of service requests with related workflow processes, escalations, and service level agreements.

---

## Ticket statuses

Every ticket has a status that indicates its position as it moves toward completion. Changes to the ticket status can happen automatically or manually.

If you change the status of a global ticket, then the same status change is automatically made to all related tickets.

Status changes can happen automatically as the result of workflows. For example, you can create a workflow that changes the status to QUEUED automatically when a ticket is assigned to an owner for resolution. Workflows can also result in tickets being automatically routed, escalated, reported to another party, or closed.

In some cases, such as that of related records, changing the status of a follow-up record might change the status of its originating record. The service desk administrator configures these options.

Your system administrator can add, remove, or change the names of the basic statuses.

### NEW

The default status that is applied when a ticket is created or inserted. You cannot return a ticket to this status after you change it.

### QUEUED

The ticket is in the queue and work can begin on it.

### INPROG

Work on the ticket is ongoing.

### PENDING

The ticket is pending an action. For example, work cannot continue until a part is received.

### RESOLVED

Information was gathered and routed, service was restored, or a solution was provided. When the status of a record changes to RESOLVED, the status of all the activities in that record changes to COMPLETE.

### CLOSE

A closed record is a historical archive and you cannot change its status. You can, however, change editable fields of the archived record. When the status of a record changes to CLOSED, the system changes the status of all activities in that record to CLOSED.

---

## Costs on tickets and work orders

You can view the estimated and actual costs for a single work order or ticket, including costs for labor, material, tools, and services. You can also view total costs for the current record and all the records below it in its hierarchy.

When you view the costs of a ticket or work order, the data is displayed in two tables:

- The Totals table displays the costs for a single ticket or work order.
- The View Hierarchy Grand Totals table displays the costs for the current ticket or work order and all records under its hierarchy.

Each table presents the same information, which is shown in the following table.

Column	Explanation
Current Estimate	Displays read-only calculated values for the current totals from the Labor, Materials, Standard Services, and Tools tabs of the Plans tab for the ticket or work order.
Estimate at Approval	Is set to zero until the work order is approved, then the values are copied from the Current Estimate column and are read-only. If the work order status changes from approved to unapproved, then these fields are cleared. The estimated costs at approval are not affected by the change in status from in progress to completed or closed.
Actual	Displays the read-only values from the Labor (for approved labor only), Materials, and Tools tabs of the Actuals tab. If the status of the record changes from approved, then these fields are not cleared.

## Rolling up maintenance costs

After you close a work order that is associated with an asset, you can calculate your maintenance costs by rolling up costs that you incur for labor, materials, tools, and services to the top-level asset in the hierarchy that the asset belongs to.

Costs can be rolled up manually or automatically. By default, cost rollups are manual. If you want costs to be calculated and rolled up automatically when a work order is closed, you must set the `mxe.workorder.rollupMaintenanceCosts` system property to 1. After you configure the system property for automatic rollups, all subsequent costs that are associated with work orders are rolled up automatically. However, any unprocessed maintenance costs that existed before the configuration are not automatically rolled up. You must roll up any preexisting, unprocessed maintenance costs manually.

To calculate the maintenance cost of your assets, use the Roll Up Maintenance Costs action in the Assets application.

If you upgrade to Maximo® Manage 8.5, run the Asset Cost Rollup Report to roll up pending maintenance costs before the upgrade.

## Linear segment details

You use the Linear Segment Details section to locate a linear segment or point on a linear asset. The Linear Segment Details section, which displays on tabs in several applications, appears only if you are working with a linear asset.

For example, if you specify a linear asset in the Asset field on a preventive maintenance record, the PM tab displays a Linear Segment Details section. If you enter a point asset, the PM tab does not display this section. The Linear Segment Details section includes fields for both the start point and the end point. If you locate a point, such as a stop sign, the start and the end points are the same.

The following terms are associated with linear segments:

### Measure

The absolute distance from the start of a linear asset. You can specify a measure manually. The measure is calculated for you if you enter a reference point and a reference point offset. In the example, using Mile Post 27 and an offset of -528, the calculated measure is 26.9 miles (528 feet = .1 mile).

### Offset

A measure from a previously defined reference point. The possible kinds of offsets are the following:

#### Reference Point Offset

The distance before or after the reference point. Specify an offset value if the segment start or end is before or after the reference point. The value can be negative (before) or positive (after). For example, if the start of the segment is 528 feet before Mile Post 27, type -528.

You cannot specify an offset that, when combined with the reference point, yields a measure that is outside the boundaries of the linear asset. For example, if reference point Mile Post 1 is at 1.0 miles on a linear asset that begins at 0.0 miles, you cannot enter an offset of -2 miles.

#### Y-Offset

A distance perpendicular to the direction of the linear asset. For example, a speed limit sign is located 10 feet from the right edge of the road. "Right" is positive and "left" is negative. Therefore, the Y offset is 10.

#### Z-Offset

A distance above a linear asset or below a linear asset. For example, an exit sign is located 18 feet above the surface of the road, and a culvert is 4 feet below the surface of the road. The Z offset for the sign is 18, and the Z Offset for the culvert is -4.

### Reference point

A feature instance that you can use as a starting point or as an ending point for a linear segment. A reference point is a means of communicating a work location. For example, it can be more useful to workers to say that roadside plowing on Route 96 begins at the intersection of Routes 96 and 75, and ends at Exit 34. It would be less useful to say the work begins at Mile 27.85 and ends at Mile 33.8.

The use of reference points varies according to department practices and to individual variation among linear assets. Some roads might have accurate and persistent mile post markers and workers can rely on them to locate work. Other roads might have few markers or no accurate markers, and users can rely on reference points. Use labels that maintenance workers in the field can easily identify.

Click Select Value to select the reference point.

### Y Reference

The point from which the Y Offset is measured.

The system administrator creates the set of Y Reference values by creating a domain in the Domains application. For roads, some common examples include midline, outer pavement edge, and inner pavement edge. For example, a stop sign is located not just 20 feet from a road, but 20 feet from the midline of a road.

### Z Reference

The point from which the Z Offset is measured.

The system administrator creates the set of Z Reference values by creating a domain in the Domains application. For roads, some common examples include road surface and road bed. For example, an exit sign is located 18 feet above the road surface, or a culvert is 12 feet below the road bed.

---

## Restrictions on deleting tickets

You can delete a ticket only when it has a certain status and only when transactions have not been recorded for it.

### Status-related restrictions

---

You can delete a ticket only if it has one of the following statuses:

- NEW.
- QUEUED.

### Transaction and record restrictions

---

You cannot delete a ticket that has the following types of transactions or records associated with it:

- Labor transactions
- Workflow history
- Child activities, although you can delete the activities and then delete the record
- Related records
- Is related to another record
- Is the originating record for another record
- Work log entries

---

## Working with service requests

You can create service requests either in the Service Requests application or as records related to other tickets or work orders. You can apply service level agreements, categorize requests, create relationships with other records, assign and record labor activities, and log actions and communications.

- [Creating service requests](#)  
You create a service request to capture information about a request, including the type of service, who needs it, where, when, and why.
- [Relating records to other records](#)  
You can relate records to each other in a ticket or work order application. For example, you can select a work order and relate it to a service request. Relating records creates a relationship type of RELATED between the records.
- [Changing the status of a list of records](#)  
You can change the status of multiple records in applications.
- [Changing archived tickets](#)  
After a ticket is closed, it is archived. To ensure that important information is maintained on historical records, you can open an archived record and change the editable fields.

---

## Creating service requests

You create a service request to capture information about a request, including the type of service, who needs it, where, when, and why.

### Procedure

---

1. In the Service Requests application, click the New Service Request icon.
  2. Specify the details of the service request.
  3. Save the record.
- [Applying service level agreements to records](#)  
You can apply a service level agreement (SLA) to a record to define the agreement and formal commitments between a service provider and a customer. The agreement documents the service to be provided or received, the agreed upon service levels for the service, and the means of measuring or quantifying the level of service.
  - [Removing service level agreements from records](#)  
To maintain accurate records, it might be necessary to remove an invalid or erroneous service level agreement to disassociate it from the record.
  - [Classifying records](#)  
You can apply a classification to a record to structure it into an organized hierarchy. You can use classifications and attributes to locate records, and help to ensure that records are not duplicated unintentionally.
  - [Adding activities to service requests](#)  
You add activities to service requests to specify the work needed to resolve the service request. These work activities are typically performed by another internal group or by a vendor, while overall management of the service request is maintained elsewhere.
  - [Creating records from existing records](#)  
To create a relationship between two records, you can create a record from an existing record. The record from which you create a change has a relationship type of ORIGINATOR, and the new record has a relationship type of FOLLOWUP.

---

## Applying service level agreements to records

You can apply a service level agreement (SLA) to a record to define the agreement and formal commitments between a service provider and a customer. The agreement documents the service to be provided or received, the agreed upon service levels for the service, and the means of measuring or quantifying the level of service.

---

## About this task

When you apply an service level agreement to work orders, the SLA is applied only to the work order, not to its tasks. If you want to apply a service level agreement to a task, you must display the task as the current record and then apply the SLA.

You can apply service level agreements to tickets and work orders.

---

## Procedure

1. Open an application and display the record that you want to update.
2. Select the Apply SLA action.
3. Click OK.

---

## Results

The SLA Applied check box on the main tab of the selected application is selected. The target start, target finish, and contact values are calculated for the selected record.

---

## Removing service level agreements from records

To maintain accurate records, it might be necessary to remove an invalid or erroneous service level agreement to disassociate it from the record.

---

## Procedure

1. Display the record for which you want to remove a service level agreement.
2. Select theSelect/Deselect SLA action.
3. Click Mark Row for Delete for each service level agreement that you want to remove from the record.
4. Click OK.
5. Save the record.

---

## Classifying records

You can apply a classification to a record to structure it into an organized hierarchy. You can use classifications and attributes to locate records, and help to ensure that records are not duplicated unintentionally.

---

## About this task

You can create one or more classification hierarchies in the Classifications application. You can apply classifications to many record types.

---

## Procedure

1. Open an application and select the record that you want to update.
2. In the Classification field, select Detail Menu > Classify.
3. Click a classification category.  
You can open additional levels of the classification until you find the desired classification category.
4. Click Select Record to return a value to the Classification field.
5. Click Save record.

---

## Adding activities to service requests

You add activities to service requests to specify the work needed to resolve the service request. These work activities are typically performed by another internal group or by a vendor, while overall management of the service request is maintained elsewhere.

---

## Procedure

1. In the Service Requests application, display the service request to which you want to add an activity.
2. In the Time Tracking table window, click New Row.
3. Select an activity work order.
4. Save the record.

- [Reporting labor time for activities on tickets](#)

You can manually record the labor time that you spend resolving individual activities that are identified on a ticket.

- [Reporting labor time using the Start and Stop timers](#)

You can use the automatic time-tracking features of the system to help you report the time spent working on a ticket or work record.

- [Classifying records](#)

You can apply a classification to a record to structure it into an organized hierarchy. You can use classifications and attributes to locate records, and help to ensure that records are not duplicated unintentionally.

- [Selecting labor for activities on tickets](#)

To record the labor resources assigned to each activity on a ticket, you can select labor for each activity and create a labor transaction.

---

## Reporting labor time for activities on tickets

You can manually record the labor time that you spend resolving individual activities that are identified on a ticket.

### Procedure

---

1. Display the ticket that contains the activity for which you want to record labor time.
2. On the Service Request tab, in the Time Tracking table window, select the activity for which you want to add a time entry.
3. Specify the details.
4. Save the record.

---

## Reporting labor time using the Start and Stop timers

You can use the automatic time-tracking features of the system to help you report the time spent working on a ticket or work record.

### Procedure

---

1. Open the record.
2. On the toolbar, click the Start Timer button.
3. To stop the timer, click the Stop Timer button.
4. Optional: If necessary, you can edit the finish date, finish time, or hours.
5. Click OK.

---

## Classifying records

You can apply a classification to a record to structure it into an organized hierarchy. You can use classifications and attributes to locate records, and help to ensure that records are not duplicated unintentionally.

### About this task

---

You can create one or more classification hierarchies in the Classifications application. You can apply classifications to many record types.

### Procedure

---

1. Open an application and select the record that you want to update.
2. In the Classification field, select Detail Menu, Classify.
3. Click a classification category.  
You can open additional levels of the classification until you find the desired classification category.
4. Click Select Record to return a value to the Classification field.
5. Click Save record.

---

## Selecting labor for activities on tickets

To record the labor resources assigned to each activity on a ticket, you can select labor for each activity and create a labor transaction.

### Procedure

---

1. Display the record that contains the activities for which you want to select labor.
2. On the main tab of the application, in the Time Tracking table window, select the activity for which you want to select labor.
3. Specify the details of the labor you are adding.
4. Save the record.

---

## Creating records from existing records

To create a relationship between two records, you can create a record from an existing record. The record from which you create a change has a relationship type of ORIGINATOR, and the new record has a relationship type of FOLLOWUP.

### Procedure

---

1. Display the record from which you want to create the related record.
2. Select the [Create a Record](#) action where *Record Type* is the type of related record you want to create.
3. Save the record.

---

## Relating records to other records

You can relate records to each other in a ticket or work order application. For example, you can select a work order and relate it to a service request. Relating records creates a relationship type of RELATED between the records.

- [Relating ticket and work order records](#)  
To help simplify record management, you can relate tickets or work orders to other tickets or work-related records using the Related Records tab of a ticket or work order application
- [Deleting relationships](#)  
When you determine that the record you are managing is no longer related to other tickets or work-related records, you can remove the relationship using the Related Records tab.
- [Removing global issue flags](#)  
If you have erroneously marked a record as global and then related tickets to the global record, you can remove the global flag on the record only after you remove the identifier for the global record in all related records.

---

## Relating ticket and work order records

To help simplify record management, you can relate tickets or work orders to other tickets or work-related records using the Related Records tab of a ticket or work order application

### Procedure

---

1. Display the record to which you want to relate other tickets and work orders.
2. On the Related Records tab, in the Related Tickets section, select the tickets that you want to relate to the current record.
3. In the Related Work Orders section, select the work orders that you want to relate to the current record.
4. Save the record.

---

## Deleting relationships

When you determine that the record you are managing is no longer related to other tickets or work-related records, you can remove the relationship using the Related Records tab.

### Procedure

---

1. Display the record that has the relationship that you want to delete.
2. Click the Related Records tab, and then delete the ticket.
3. Save the record.

---

## Removing global issue flags

If you have erroneously marked a record as global and then related tickets to the global record, you can remove the global flag on the record only after you remove the identifier for the global record in all related records.

### Procedure

---

1. Display the record for which you want to remove the global flag.
2. Click the Related Records tab.
3. For each related record, click the Detail Menu icon and select *Go To Application* where *Application* is the application for that type of record.
4. Remove the value in the Related to Global ID field.
5. Save the record.

6. After removing the relationship from all relevant records, display the global record and clear the Global Issue check box.
7. Save the record.

---

## Changing the status of a list of records

You can change the status of multiple records in applications.

### Procedure

---

1. In the Work Order application, on the List tab of an application, filter the records so that less than 200 records are displayed.
2. Scroll down the bottom of the screen and select the Select Records check box.  
The screen refreshes and each row now has a check box.
3. Select the check boxes for the work orders whose status you want to change.
4. Click the Change Status action and enter the information in the dialog box.
5. Click OK to close the Change Status window.

---

## Changing archived tickets

After a ticket is closed, it is archived. To ensure that important information is maintained on historical records, you can open an archived record and change the editable fields.

### Procedure

---

1. Display the record whose history you want to edit.
2. Select the Edit History action.
3. Change the ticket.
4. Save the record.

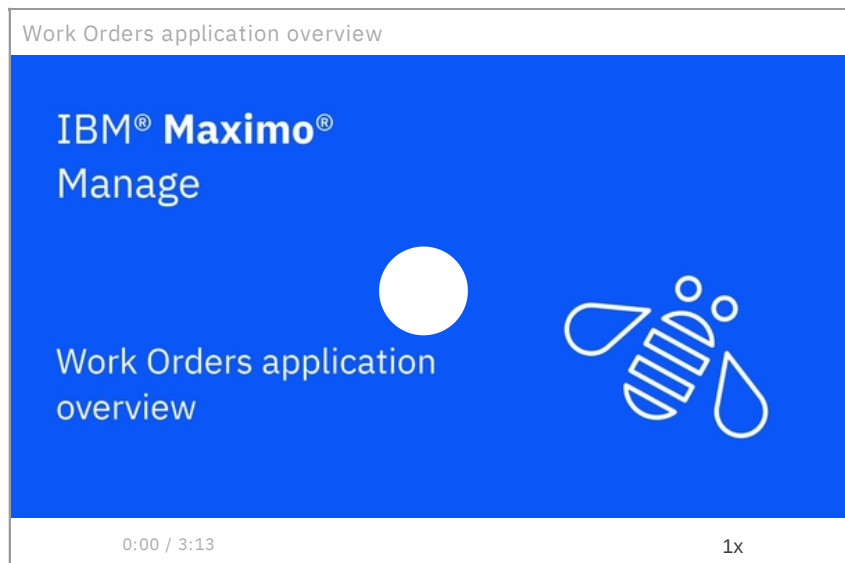

---

## Work Orders application

The Work Orders application is a modernized, simplified version of the Work Order Tracking application that contains the most important actions and information for work orders. It also contains workflow assignment integration, a new status bar, the ability to organize work orders into custom views, and productivity features, such as type-ahead search.

### Overview

---

Similar to the Work Order Tracking application, you can use the Work Orders application to:

- Create work orders.
- Create follow-up work orders.
- View information about each work order, such as its long description, related records, work log, attachments, and history.
- Change the status of a work order.
- Change the owner or owner group of a work order.

The Work Orders application is also integrated with the workflow process. If a workflow is available for a work order, you can start the workflow on the Work orders list page or from the Actions menu or the Workflow assignments section of the work order details page.

You can also see the status of each work order in the status bar and organize your work orders into custom views. For more information, see [Status bar](#) and [Custom views](#). You can also save time with features like type-ahead search.

- **Status bar**  
The status bar on each work order's summary page provides a visual timeline of the work order's status history. You can see the dates and times of past statuses and future steps that must still be completed before the work order can be closed.
- **Custom views**  
A view is a subset of information that can be displayed by applying filters or sorting. When you open the Work orders page, the unique mix of columns, filters, and search terms that you see is a view. If you change this configuration, such as by selecting different columns or entering search or filter criteria, you can save it as a custom view. You can then return to that configuration with one click, without having to manually change your settings every time.

---

## Status bar

The status bar on each work order's summary page provides a visual timeline of the work order's status history. You can see the dates and times of past statuses and future steps that must still be completed before the work order can be closed.

The Work Orders application provides the same statuses out of the box as the Work Order Tracking application. For more information, see [Work order statuses](#).

You can create custom statuses for your company by using [synonym domains](#) of existing statuses. For more information, see [Creating synonyms of internal values](#).

You can also delete custom statuses. For more information, see [Deleting synonyms of internal domain values](#).

---

## Custom views

A view is a subset of information that can be displayed by applying filters or sorting. When you open the Work orders page, the unique mix of columns, filters, and search terms that you see is a view. If you change this configuration, such as by selecting different columns or entering search or filter criteria, you can save it as a custom view. You can then return to that configuration with one click, without having to manually change your settings every time.

You can create custom views for yourself or your organization. To create a custom view, change the Work orders page to the configuration that you want to save and then in the View list, click Save as new view.

Views can be public or private. Public views are visible to everyone in your organization, but private views are visible only on your account. To create a public view, click the Public view checkbox. To create a private view, clear the Public view checkbox.

You can also manage and delete views after they are created. To change the name of a view, select or remove it as your default view, change whether a view is public or private, or delete a view, in the View list, click Manage views. To save changes to an existing view without creating a new view, in the View list, click Save changes.

---

## Workflow Assignments application

You can use the Workflow Assignments application to monitor your workflow assignments and take advantage of time-saving features.

The Workflow Assignments application shows all of the workflow assignments that are assigned to you. You can use the KPIs on the list page to easily track:

- Whether you have any overdue assignments.
- How many assignments are due this week.
- How many assignments are Priority 1.
- How many work orders your assignments are associated with.

In addition to being tracked on the Overdue tile, overdue assignments in the table are marked by a red icon.

The Workflow Assignments application supports both singular and bulk actions. Select a single assignment to route it or select multiple assignments to accept, reject, or reassign them all at once.

You can click any assignment to open it in the application in which it was created. You can also organize your assignments into custom views. For more information, see [Custom views](#).

---

## Monitoring

You can enable monitoring for applications in Red Hat® OpenShift® Container Platform.

- **Configuring monitoring and metrics**  
Configure monitoring and metrics using Red Hat OpenShift Container Platform.
- **Creating config map**  
Create a config map by using an YAML.
- **Creating service**  
Create a service.

- [Querying metrics](#)  
You can search for metrics in Maximo Manage.
- [Setting up Grafana](#)  
Follow the steps to set up Grafana.

## Configuring monitoring and metrics

Configure monitoring and metrics using Red Hat® OpenShift® Container Platform.

### Procedure

1. Monitoring: <https://docs.openshift.com/container-platform/4.6/monitoring/enabling-monitoring-for-user-defined-projects.html#enabling-monitoring-for-user-defined-projects>
2. Metrics: <https://docs.openshift.com/container-platform/4.6/monitoring/managing-metrics.html#managing-metrics>

## Creating config map

Create a config map by using an YAML.

### Procedure

1. Go to project: **openshift-monitoring**.
2. Go to Config Maps and create a config map using the following YAML.
  - a. Set the **enableUserWorkload** setting to "true" under **data/config.yaml**
3. Save the file to apply the changes. It creates a new operator and prometheus instance in the **openshift-monitoring-user-workload** namespace, and this instance is able to monitor **servicemonitor** kinds in the namespace.

YAML:

```
apiVersion: v1
kind: ConfigMap
metadata:
 name: cluster-monitoring-config
data:
 config.yaml: |
 enableUserWorkload: true
```

```
$ oc -n
openshift-user-workload-monitoring get
pod
```

NAME	READY	STATUS	RESTARTS	AGE
prometheus-operator-6f7b748d5b-t7nbg	2/2	Running	0	3h
prometheus-user-workload-0	5/5	Running	1	3h
prometheus-user-workload-1	5/5	Running	1	3h
thanos-ruler-user-workload-0	3/3	Running	0	3h
thanos-ruler-user-workload-1	3/3	Running	0	3h

## Creating service

Create a service.

### Procedure

1. Go to Manage project : **mas-<instanceid>-manage**
2. Create service **<instanceid>-<workspaceid>-<bundlename>-monitoringagent** YAML. Replace **instanceid**, **workspaceid**, and **bundlename** in the following example:

```
apiVersion: v1
kind: Service
metadata:
 labels:
 app: <instanceid>-<workspaceid>-<bundlename>
 name: <instanceid>-<workspaceid>-<bundlename>-monitoragent
 namespace: mas-<instanceid>-manage
spec:
 ports:
 - name: 9080-tcp
 protocol: TCP
 port: 9080
 targetPort: 9080
 - name: https
 protocol: TCP
 port: 9444
```

```
targetPort: 9444
selector:
 app: <instanceid>-<workspaceid>-<bundlename>
type: ClusterIP
```

## Querying metrics

You can search for metrics in Maximo® Manage.

### Procedure

1. Go to Monitoring > Metrics. The following queries are available:

Table 1. List of queries

Query	Description
maximo_mbo_count	Business object count
maximo_heap_memory_max_count	Maximum heap
maximo_heap_memory_used_count	Used heap
maximo_thread_pool_size	Thread pool size
maximo_thread_deadlock	Deadlock threads
maximo_thread_count	Thread count
maximo_thread_pool_active_count	Thread pool active count
maximo_thread_pool_active_count	Thread pool active count
maximo_thread_peak_count	Thread pool peak count
maximo_db_connection_free_count	Free number of DB connections
maximo_db_connection_used_count	Used number of DB connections
maximo_db_connection_total_count	Total number of DB connections
maximo_session_stats_active_count	Count of active sessions
maximo_session_stats_live_count	Count of live sessions
maximo_session_stats_create_count	Count of session stats created on Liberty

2. Click the detail icon to get the list of queries.

Figure 1. Maximo queries

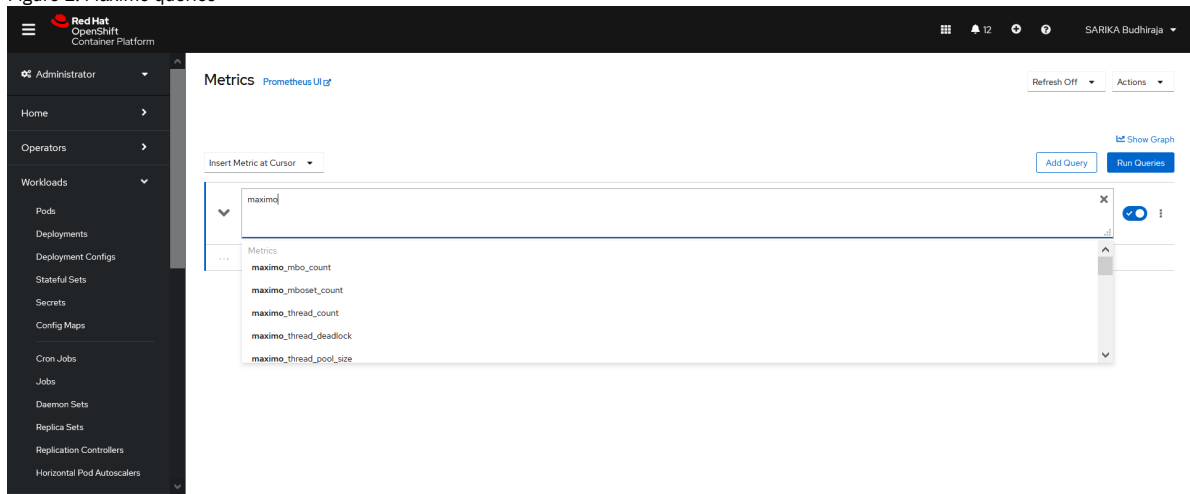

Figure 2. Sample graph

## Setting up Grafana

Follow the steps to set up Grafana.

### Procedure

Use the following link to setup Grafana.

<https://github.com/ibm-watson-iot/iot-docs/tree/master/monitoring#3-grafana-setup>

Figure 1. Sample dashboard

## Troubleshooting Maximo Manage

Maximo® Manage provides tools that you can use to help you troubleshoot and resolve issues with the application.

- [Manage Monitoring Information](#)  
The Manage Monitoring Information (MMI) application provides information about the current state of a Manage deployment. You can use this information for troubleshooting purposes.
- [JDOM upgrade](#)  
JDOM upgrade in Maximo Manage 8.5 is recommended.
- [Debugging Maximo Manage with Eclipse](#)  
Debug Maximo Manage by using the Eclipse debugger.
- [Enabling debugging for Maximo Manage](#)  
It is possible to remotely debug Maximo Manage by connecting to the Liberty server.

## Manage Monitoring Information

The Manage Monitoring Information (MMI) application provides information about the current state of a Maximo deployment. You can use this information for troubleshooting purposes.

The application displays the following information about the server bundle pods that are deployed:

- System information
  - Database information
  - Maximo® business object (MBO) count
  - Memory
  - Java™ (JVM) information
  - Threads
  - Operating System information
- Integration information
  - Queues
  - OS cache
  - Global directory
  - Event topic tree
- Other information
  - User information
  - Class information
  - Cron tasks
  - Appservices

The monitoring information is provided by a set of REST APIs.

MMI uses JavaScript Object Notation (JSON) as the data format for representing the collected state information. All MMI requests are HTTP GET requests, and MMI request handlers are not intended to modify the state of the system.

- [Manage Monitoring Information APIs](#)  
Manage Monitoring Information (MMI) APIs provide information that is related to the state of a Maximo Manage deployment.
- [Scenario: Running MMI APIs to gather diagnostic information](#)  
XYZ Corporation experiences an issue in the Maximo Manage environment and the system administrator opens a Problem Management Report (PMR) with IBM® Technical Support. IBM Technical Support and Development determine that there is a need to gather diagnostic information for particular resources from the customer's environment.

## Manage Monitoring Information APIs

Manage Monitoring Information (MMI) APIs provide information that is related to the state of a Maximo® Manage deployment.

A list of available MMI APIs is in the Monitor Environment Information dialog of the Logging application.

Before you can collect information from the Maximo Manage environment by using the APIs, you must specify the URL path for the API in the mxo.oslc.webappurl system property. You can choose one of the following options for the path:

- `<Maximo Manage URL>/maximo/api/members/<memberid>/<api>`  
For example:  
`https://my_instance.manage.7203.apps.my_company.com/maximo/api/members/<memberid>/mbocount`  
Use this option when you have an API key.
- `https://<host>:<port>/maximo/oslc/members/<memberid>/<api>`  
For example:  
`https://<host>:<port>/maximo/oslc/members/<memberid>/mbocount`  
Use this option when you already have an open, authenticated session.

In the preceding examples, specify the Maximo Manage server bundle for the `<memberid>`.

All MMI APIs can be protected by using signature options. The signature options must be associated with the Logging application. To specify a signature option for an API, open the Monitor Environment Information dialog in the Logging application, locate the API, and select a value in the Signature Option field.

Table 1. Manage Monitoring Information APIs

API	Description	URL path Note: You can also use the OSLC URL if you have an authenticated session.
apimetrics	API Metrics handler	/maximo/api/members/<memberid>/apimetrics
appservices	AppService information	/maximo/api/members/<memberid>/appservices
args	JVM arguments information	/maximo/api/members/<memberid>/args
browseMessages	Browse JMS messages	/maximo/api/members/<memberid>/browseMessages
childdirs	Child directory information	/maximo/api/members/<memberid>/childdirs

API	Description	URL path Note: You can also use the OSLC URL if you have an authenticated session.
classinfo	Java™ class information	/maximo/api/members/<memberid>/classinfo
clouddbstatistics	Cloud Database Storage	/maximo/api/members/<memberid>/clouddbstatistics
clouddbstorage	Cloud Database Storage	/maximo/api/members/<memberid>/clouddbstorage
cron	Cron task information	/maximo/api/members/<memberid>/cron
cronthread	Concurrent cron task thread count and peak thread count Counts the total cron threads running at this instant in the current server process. It also provides the peak count of cron threads on that server	/maximo/api/members/<memberid>/cronthread
dbconn	Database connection creation trace	/maximo/api/members/<memberid>/dbconn
dbinfo	Database information Provides information about the database that is used by the application, including information about the database version, vendor information, and driver information.  Also provides links to the database connection pool details.	/maximo/api/members/<memberid>/dbinfo
dbmanager	Database connection pool information	/maximo/api/members/<memberid>/dbmanager
errcountmetrics	Error count metrics handler Provides the total count of <b>MXApplicationException</b> and <b>MXSystemException</b> exceptions that are created.	/maximo/api/members/<memberid>/errcountmetrics
eventtree	EventTopicTree information Provides information about the event subscription tree. The resource describes information about event topics, such as add asset or update work order, and the listeners that are associated with those topics.	/maximo/api/members/<memberid>/eventtree
formula	Formula information	/maximo/api/members/<memberid>/formula
globaldir	Integration global directory information	/maximo/api/members/<memberid>/globaldir
heapdump	Generate heapdump (currently for the IBM® JDK only)	/maximo/api/members/<memberid>/heapdump
http	Ping an HTTP or HTTPS URL	/maximo/api/members/<memberid>/http
interfaces	Java class interface information	/maximo/api/members/<memberid>/interfaces
iotservices	IoT services	/maximo/api/members/<memberid>/iotservices
jaxp	Java API for XML Processing (JAXP) provider information Provides information about the JAXP providers on the server.	/maximo/api/members/<memberid>/jaxp
jvm	Java virtual machine (JVM) information Provides information about the JVM that is hosting the application, including information about the start time, the JVM vendor, and the JVM version.  You can also drill down, by using links, to provide information about the JVM system properties and the JVM arguments.	/maximo/api/members/<memberid>/jvm
ldapsearch	LDAP search	/maximo/api/members/<memberid>/ldapsearch
loggers	Application logger state information Provides information about the state of a logger. The logger name can be provided to the API by using the oslc.where query parameter. An example of a parameter is oslc.where=oslc:shortId="maximo.script".  Provides information about the automation script logger. API consumers specify the logger name by using the oslc:shortId property for this API to provide information about the logger, which includes the log level, and active state.	/maximo/api/members/<memberid>/loggers
mbocount	MBO count information Provides MBO count information. Also provides links to the MBO and the MboSet class. This class can be useful when you are trying to resolve out of memory (OOM) or performance issues.	/maximo/api/members/<memberid>/mbocount
memory	JVM memory information Provides information about the server heap and nonheap memory usage. All units are in Megabytes (MB).	/maximo/api/members/<memberid>/memory
mifwebservices	Web service information	/maximo/api/members/<memberid>/mifwebservices
msgproviders	Validate message provider connectivity	/maximo/api/members/<memberid>/msgproviders
objexchanged	Object Exchanged Count Provides the number of integration and UI objects that are exchanged per minute on each server.	/maximo/api/members/<memberid>/objexchanged
opsystem	Operating system information Provides information about the operating system that is used for the run time, including information about the OS type, version, architecture, and the number processors that are available.	/maximo/api/members/<memberid>/opsystem

API	Description	URL path Note: You can also use the OSLC URL if you have an authenticated session.
oscache	Object structure cache Provides information about the object structure cache. It identifies cases where invalid entries in the Object Structure tables might cause cache corruption.	/maximo/api/members/<memberid>/oscache
oslcstablecache	OSLC stable cache information	/maximo/api/members/<memberid>/oslcstablecache
pingcos	Ping Cloud Object Storage (Cloud Object Storage) Provides the response time for connecting to Cloud Object Storage and the status for Cloud Object Storage connectivity.	/maximo/api/members/<memberid>/pingcos
pingdb	Ping DB Checks the database connection and calculates the average response time that is required to run 10 recent queries. These queries are obtained from the system tables. The queries are run on Oracle and Db2® databases.	/maximo/api/members/<memberid>/pingdb
pingkafka	Kafka ping handler Provides the response time for connecting to Kafka and the status for Kafka connectivity.	/maximo/api/members/<memberid>/pingkafka
queues	Integration queues information Provides information about state of an integration queue. The resource allows consumers of the API to test the connectivity/read/write to the queue and to browse messages in the queue spi:browseMessage property.  By default the API shows only the first five messages in the queue. You can control that number by using the query string oslc.where=spi:count=10. This query shows the first 10 messages in the queue.  Note: Browsing messages is a costly call and browsing too many messages simultaneously can cause memory or performance issues in the server.	/maximo/api/members/<memberid>/queues
report	Collects report metrics Provides the following report metrics: <ul style="list-style-type: none"> <li>Total number of reports that ran in the preceding hour</li> <li>Total accumulated time in seconds that reports are run in a particular day</li> <li>Information about the concurrent report usage and daily runtime of reports</li> </ul>	/maximo/api/members/<memberid>/report
resources	Resources in OSLC stable cache	/maximo/api/members/<memberid>/resources
servletstats	Collects servlet statistics Provides request and response information about the OSLCServlet, RESTServlet, and UIServlet for each application that is deployed. The response time is measured in milliseconds.	/maximo/api/members/<memberid>/servletstats
sessionstatsinfo	Session stats information for IBM WebSphere® Application Server Liberty Provides information on total sessions, active sessions, and live sessions.	/maximo/api/members/<memberid>/sessionstatsinfo
sysprops	Java virtual machine (JVM) system properties information	/maximo/api/members/<memberid>/sysprops
tablesize	Collect the five database tables with the largest size Provides information about the five database tables that have the largest table size per day. The table size is measured in MB per day.	/maximo/api/members/<memberid>/tablesize
testProviderConnection	Test connection to JMS provider	/maximo/api/members/<memberid>/testProviderConnection
testReadMessage	Test read JMS message	/maximo/api/members/<memberid>/testReadMessage
testWriteMessage	Test write JMS message	/maximo/api/members/<memberid>/testWriteMessage
threaddump	Thread dump	/maximo/api/members/<memberid>/threaddump
threadpoolinfo	Thread pool information for the IBM WebSphere Application Server Liberty profile Counts total thread pool size and total active thread pool count.	/maximo/api/members/<memberid>/threadpoolinfo
threads	JVM thread information Provides information about the threads in the JVM, such as the current thread count, peak thread count, and whether there are any deadlocks. Also provides a link to enumerate the threads in the system at that instant. The API consumer can check for thread states and lock information about each thread.  Provides runtime thread count information that includes concurrent thread count and deadlocked thread counts.	/maximo/api/members/<memberid>/threads

## Scenario: Running MMI APIs to gather diagnostic information

XYZ Corporation experiences an issue in the Maximo® Manage environment and the system administrator opens a Problem Management Report (PMR) with IBM® Technical Support. IBM Technical Support and Development determine that there is a need to gather diagnostic information for particular resources from the customer's environment.

IBM Technical Support and Development review the available resources in the Monitor Environment Information dialog of the Logging application and determine that the system administrator should run a particular MMI API. In some cases, if an API that is needed to collect the information is not readily available, IBM

development might provide a script that can collect the needed information.

IBM instructs the system administrator to run the API in a web browser by entering a URL similar to `http://<host>:<port>/maximo/api/members/<memberid>/<api>`. The system administrator submits the resulting diagnostic output with the PMR for analysis by IBM.

## API output

---

When the system administrator runs the MMI API by entering the required URL in the browser, the output is displayed directly in the browser.

The output is not formatted or easily readable unless the browser has a JSON viewer add-on or extension installed. JSON viewers are available for the Mozilla Firefox and Google Chrome browsers.

The system administrator saves the output in the browser to a text file and submits the file with the PMR for analysis by IBM.

## Writing scripts

---

If a system administrator who meets several prerequisite skills chooses to write a script without the help of IBM Technical Support and Development, the following sample script can be used as a template.

Attention: Do not write scripts unless you meet the prerequisite skills or are instructed to do so by IBM.

## Prerequisite skills

---

To write scripts for resources that are outside the scope of the provided scripts, the following skills are required.

- System administrator level
- Experience with calling the REST API
- Programming and script language skills

## Sample script

---

A system administrator wants to determine how many listeners are associated with each object event type. The system administrator wants to analyze the listener data to investigate a possible performance issue that might be related to listeners on particular assets. This goal requires a way to access the event topic tree in the Maximo Manage server and search for the specified topic, Object event type, and then find out the number of associated listeners. The following Jython script addresses this requirement.

```
from psdi.server import MXServer
if request.getWhere() is not None and request.getWhere().get("topic") is not None:
 eventTopicToFind = request.getWhere().get("spi:topic")[0]

 eventTopic = MXServer.getMXServer().getEventTopicTree().findEventTopic(eventTopicToFind)

 listenerCount = eventTopic.getListenerCount()
 br.setProperty("listenerCount", listenerCount)
```

The MMI framework includes several variables in the script.

- request - The MMI API request object. The script uses the request object to determine the object event type that the user is interested in.
- br - The response that the API returns to the user.

The script uses the request object to determine the object event type by using the Where parameter in `eventTopicToFind = request.getWhere().get("topic")[0]`.

The br parameter has a simple `setProperty(string,any)` interface that is used by the script to gather the information it will send back to the user. The script uses the br `setProperty` API to set the listenerCount integer to the br object. This object is used to format the response to the API consumer.

The script can be added to the MMI by opening the Monitor Environment Information dialog in the Logging application, selecting New Row, and specifying the script name in the Class or Script Name field. The script must be specified in the qualified notation, `script:<script name>`, for example, `script:LISTENERS`.

The script is run by using the URL syntax `http://<host>:<port>/maximo/api/members/<memberid>/<event topic context>?oslc.where=spi:topic="maximo.asset.add"`.

Example URL: `http://127.0.0.1/maximo/api/members/OS4zM4yMS4xMzcvTVhTZXJ2ZXI-/eventtopic?oslc.where=topic="maximo.asset.add"`

---

## JDOM upgrade

JDOM upgrade in Maximo® Manage 8.5 is recommended.

## Problem

---

In Maximo Manage 8.5, JDOM was susceptible to a service denial. This JDOM vulnerability does not apply to Maximo Application Suite but affects Maximo Manage. In Maximo Manage 8.5, by sending a specially-crafted HTTP request, a remote attacker could use the JDOM vulnerability to block the service. The service denial is caused by an XXE issue in SAXBuilder. Affected platforms are JDOM JDOM 2.0.5 and JDOM JDOM 2.0.6.

## Solution

---

The issue has been addressed in Maximo Manage 8.5.

Note: The JDOM upgrade may cause compatibility issues with your existing code. It is recommended to recompile your code with the new JDOM provided with Maximo Manage 8.5 to resolve any compilation issues.  
For more information, see [National Vulnerability Database](#).

---

## Debugging Maximo Manage with Eclipse

Debug Maximo® Manage by using the Eclipse debugger.

### Prerequisites

---

The local machine where you install Eclipse must have the following tools:

- Red Hat® OpenShift® Container Platform command-line interface. For more information, see [Getting started with the CLI](#).
- Kubernetes command line tool. For more information, see [Install Tools](#).

### Creating a stand-alone server deployment

---

1. In the Red Hat OpenShift Container Platform console, go to Workloads > Deployments and locate the existing all or ui deployment.
2. View the YAML, then copy the spec.template.spec section.  
Note: You might find it easier to download the YAML first.
3. Select Create Deployment and assign a unique name. For example, manageddebug. Update the following:
  - a. Replace the spec.template.spec section with the copied spec.
  - b. Set the replicas to 1.
  - c. Add metadata:name as manageddebug. Make sure make sure spec.selector:matchLabels:app is set to manageddebug.

```
kind: Deployment
apiVersion: apps/v1
metadata:
 name: manageddebug
 namespace: mas-debug-manage
spec:
 replicas: 1
 selector:
 matchLabels:
 app: manageddebug
```

4. Locate the ports section and add port 7777.

```
ports:
- containerPort: 9080
 protocol: TCP
- containerPort: 9443
 protocol: TCP
- containerPort: 7777
 protocol: TCP
```

5. Update cmd args for the Maximo Manage server. Replace `/tmp/startwlp.sh;` with `/tmp/genJDBCTruststore.sh;`  
`/opt/ibm/wlp/bin/server debug defaultServer;`

```
image: >-
 image-registry.openshift-image-registry.svc:5000/mas-sb1-manage/sb1-masdev-
 all@sha256:6e6891b03d9237e64b6a3c4c41fd8dc331da74cf4cb2393a3ba70588599c600f
args:
- >-
 echo generateKeyStore...; openssl pkcs12 -export -in
 /etc/ssl/certs/internal-manage-tls/tls.crt -inkey
 /etc/ssl/certs/internal-manage-tls/tls.key -out ${java_keystore}
 -password pass:${java_keystore_password}; /tmp/genJDBCTruststore.sh; /opt/ibm/wlp/bin/server debug
```

Save the deployment and wait a moment for the pod to be created. Note down the pod name.

Note: The WebSphere® Application Server Liberty waits for the debugger to attach before it starts. Currently, the Logs tab displays the following:

```
generateKeyStore...
```

```
Listening for transport dt_socket at address: 7777
```

---

### Configuring port forwarding

1. From the Red Hat OpenShift Container Platform console, copy the login command.
2. On the local Eclipse machine, open a PowerShell for Windows command and paste the copied login command.
3. If it is necessary, use the **oc project** command to switch to the appropriate project.
4. Locate the name of the manageddebug pod.
5. Enter **kubecttl port-forward <podname> 7777:7777**.
6. Wait for the forwarding messages:

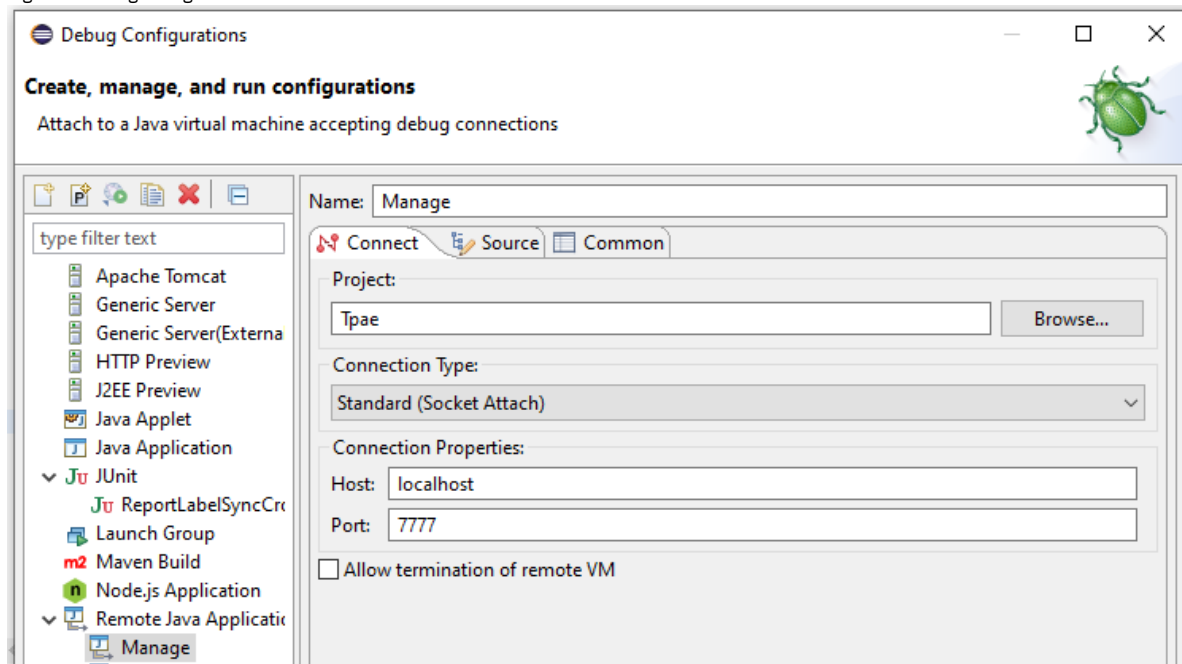

```
kubecttl port-forward manageddebug-57d79d4dfc-q82vn 7777:7777
```

```
Forwarding from `127.0.0.1:7777 -> 7777`
Forwarding from `[::1]:7777 -> 7777`
```

## Creating the remote debug configuration

1. From the Eclipse debug view, create a Java Remote Application.
2. Attach an appropriate source code project, and attach the Java Remote Application to port 7777.
3. Set the Host field in the debug configuration to localhost.

Figure 1. Debug configurations

## Connecting the remote debugger to the listener

Launch the debug configuration. Once the debugger connects, the console displays, "Handling connection...".

```
Forwarding from `127.0.0.1:7777 -> 7777`
Forwarding from `[::1]:7777 -> 7777`
Handling connection for 7777
```

You can watch the server start progress in the pod's Logs tab.

## Defining remote access to the debug server

1. In Networking > Services, create a new service for the deployment.
2. Follow the port mapping from the existing server bundles.
3. Set spec.selector to 'app: manageddebug'.

```
selector:
 app: manageddebug
```
4. After the service is created, select the Pods tab to confirm that the labels are correctly defined and the service is applied to the debug pod.
5. In Networking > Routes, create a route for the new service, by following the existing all or ui route.
6. Use the new route location to go to the Maximo Manage application.
7. Add /maximo to the route to access the debug server.

## Enabling debugging for Maximo Manage

It is possible to remotely debug Maximo® Manage by connecting to the Liberty server.

## Configuring debug mode

1. When you deploy Maximo Manage, in the Maximo Application Suite user interface, set the debugMode to "up" and save the configuration.

Figure 1. Set debug Mode in Maximo Application Suite user interface

Or, you can set up the serverbundle property in your instance from the ManageWorkspace CustomResourceDefinitions (CRD).

Figure 2. Set debugMode in CRD

2. Go to Workloads > Deployments and make sure to scale down the ibm-mas-manage-operator deployment and entitymgr-ws deployment to '0'.
3. Go to Deployments > serverbundle and edit the YAML file to add port 7777 in the serverbundle container.

Figure 3. Set port

4. Go to Networking > NetworkPolicies and adjust the serverbundle network policy to allow port 7777.

Figure 4. Adjust network policy

- Update the cmd args for the Maximo Manage server by replacing `/tmp/startwlp.sh;` with `/tmp/genJDBCTruststore.sh;`  
`/opt/ibm/wlp/bin/server debug defaultServer;`

```
image: >-
 image-registry.openshift-image-registry.svc:5000/mas-devlatest-manage/devlatest-masdev-
all@sha256:362ce629e6abaa52750e5d5499e07c3626d75810d033b14d7bcea42fcae16998
 args:
 - >-
 echo copy additional jvm options is exists; cp
 /opt/ibm/wlp/usr/servers/defaultServer/manage/jvmoptions/jvm.options
 /opt/ibm/wlp/usr/servers/defaultServer/configDropins/overrides/.;
 echo generateKeyStore...; openssl pkcs12 -export -in
 /etc/ssl/certs/internal-manage-tls/tls.crt -inkey
 /etc/ssl/certs/internal-manage-tls/tls.key -out ${java_keystore}
 -password pass:${java_keystore_password};
 /tmp/genJDBCTruststore.sh; /opt/ibm/wlp/bin/server debug
 defaultServer;
```

- Save the deployment and wait for the pod to be created. Note down the pod name.
- Wait for the debugger to attach before it starts.
- Check that the Logs tab displays the following lines:

Figure 5. Logs tab

## Configuring port forwarding

- From the Red Hat® OpenShift® Container Platform console, copy the login command.
- On the local Eclipse system, open a PowerShell for Windows command and paste the copied login command.
- If it is necessary, use the **oc project** command to switch to the appropriate project.
- Locate the name of the newly created all or ui serverbundle pod. For example, `devlatest-masdev-all-7bd96d9cb-hb6cm`.
- Run the command **kubectl port-forward <podname> 7777:7777**.
- Wait for the forwarding messages:

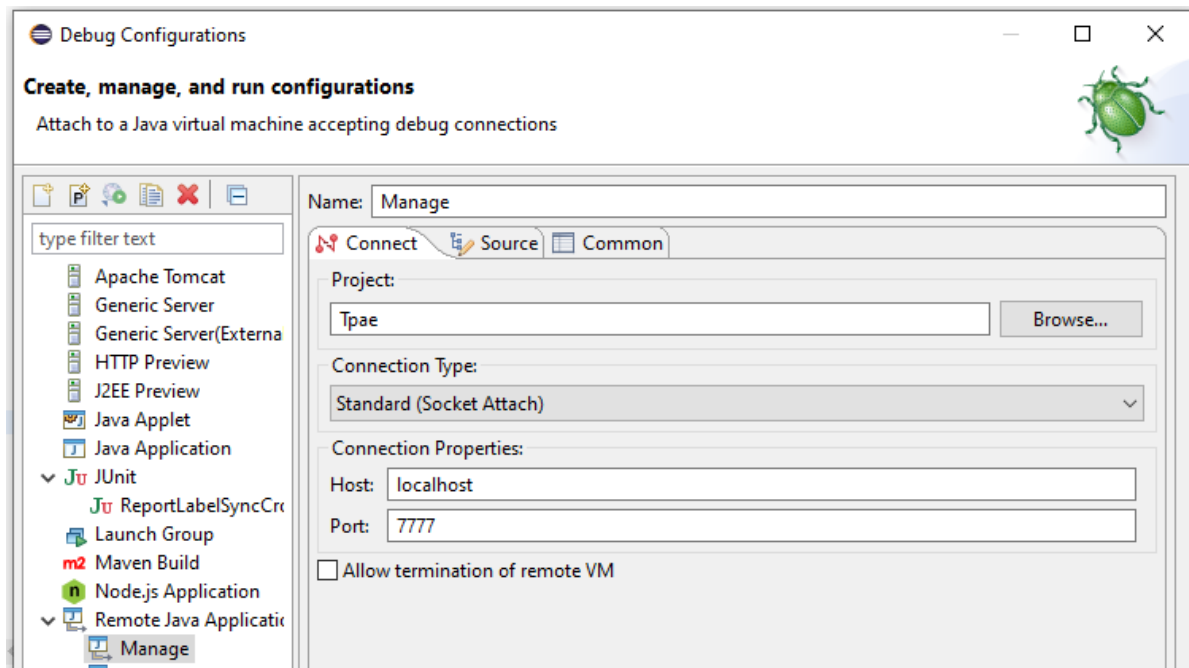

```
kubectl port-forward devlatest-masdev-all-7bd96d9cb-hb6cm 7777:7777

Forwarding from `127.0.0.1:7777 -> 7777`
Forwarding from `[::1]:7777 -> 7777`
```

## Creating the remote debug configuration

- From the Eclipse debug view, create a Java™ Remote Application.
- Attach an appropriate source code project, and attach the Java Remote Application to port 7777.
- Set the Host field in the debug configuration to localhost.

Figure 6. Debug configurations

## Connecting the remote debugger to the listener

Launch the debug configuration. Once the debugger connects, the console displays, "Handling connection...".

```
Forwarding from `127.0.0.1:7777 -> 7777`
Forwarding from `[::1]:7777 -> 7777`
Handling connection for 7777
```

You can watch the server start progress in the pod's Logs tab.

## Checking pods and accessing debug server

1. In Networking > Services, check the existing service for all or ui serverbundle pod. Select the Pods tab to confirm that the labels are correctly defined, the service is applied to the debug pod, and the pod is visible in the Pods tab.
2. In Networking > Routes, click the existing all or ui route to go to the Maximo Manage application and add /maximo to the route to access the debug server.

## Reference

Supplementary information is available to describe the features in Maximo® Manage.

- [Conditional user interface features](#)  
Maximo Manage implements conditional user interface features in some applications. Conditional user interface features are available only when certain conditions are met.
- [Properties for workspace deployment](#)  
The custom resource for the Maximo Manage workspace provides properties for activating the application.
- [System properties](#)  
You can modify the default values for system properties to tailor the system to your needs.
- [Maximo Manage facts](#)

## Conditional user interface features

Maximo Manage implements conditional user interface features in some applications. Conditional user interface features are available only when certain conditions are met.

The conditional user interface features are documented in the IBM® Support knowledge base: [Technotes about Conditional User Interface features](#)

## Properties for workspace deployment

The custom resource for the Maximo® Manage workspace provides properties for activating the application.

Database

The following table describes the fields in the workspace custom resource that are used for database properties:

Table 1. Database properties

Field	Description	Additional information
dbSchema	The database schema that contains the Maximo Manage database tables.	Required field.
encryptionSecret	The encryption keys and algorithms that are used for Crypto and Cryptox encryption.	<p>The following keys are supported:</p> <ul style="list-style-type: none"> <li>• MXE_SECURITY_CRYPTTO_ALGORITHM</li> <li>• MXE_SECURITY_CRYPTTO_KEY</li> <li>• MXE_SECURITY_OLD_CRYPTTO_KEY</li> <li>• MXE_SECURITY_CRYPTTO_MODE</li> <li>• MXE_SECURITY_CRYPTTO_MODULUS</li> <li>• MXE_SECURITY_CRYPTTO_PADDING</li> <li>• MXE_SECURITY_CRYPTTO_SPEC</li> <li>• MXE_SECURITY_CRYPTOX_ALGORITHM</li> <li>• MXE_SECURITY_CRYPTOX_KEY</li> <li>• MXE_SECURITY_OLD_CRYPTOX_KEY</li> <li>• MXE_SECURITY_CRYPTOX_MODE</li> <li>• MXE_SECURITY_CRYPTOX_MODULUS</li> <li>• MXE_SECURITY_CRYPTOX_PADDING</li> <li>• MXE_SECURITY_CRYPTOX_SPEC</li> </ul>
tableSpace	The table space for the database.	This property is needed only for the initial deployment of the database. You do not have to provide it for upgrades.
indexSpace	The index space for the database.	This property is needed only for the initial deployment of the database. You do not have to provide it for upgrades.
demodata	Indicates whether to include demo data when the database is created. To include demo data, set the value to true.	<p>The default is false.</p> <p>This property is needed only for the initial deployment of the database. You do not have to provide it for upgrades.</p>
db2Vargraphic	Indicates whether the database uses the vargraphic data type. This field is provided for IBM® Db2®.	<p>The default is true.</p> <p>If you use IBM Db2 and plan to install a language other than English for your base language or as additional languages, ensure that you set the value of this field to true.</p>
bypassUpgradeVersionCheck	Indicates whether to bypass the upgrade version check when a database is installed.	<p>Optional field.</p> <p>The default is false.</p> <p>If you experience failures when the database is installed, you can set this property to true, which allows the installation to complete regardless of the database version. You can then review the log files to evaluate the problem, and if necessary you can fix the installation issue.</p>

#### Languages

The following table describes the fields in the workspace custom resource that are used for language properties:

Table 2. Language properties

Field	Description	Additional information
baseLang	The base language for the application.	<p>Required field.</p> <p>The default is English.</p> <p>If you select English, you can specify a different base language when you redeploy the application. However, if you specify a language other than English, you cannot change that base language when you redeploy the application.</p>
secondaryLangs	The secondary languages for the application.	<p>Optional field.</p> <p>By default, no secondary language is specified.</p> <p>If you work directly in the YAML file for the workspace custom resource, be aware that quotation marks are required if you specify Norwegian for your language, for example 'NO'. If you do not add the quotation marks, NO is interpreted as the Boolean NO instead of an ISO language code.</p>

#### Generated images

The following table describes the fields in the workspace custom resource that are used for generating images to an external registry:

Table 3. Generated images properties

Field	Description	Additional information
registryForGeneratedImages:registryPath	The URL that points to the location of the external registry.	Optional field.
registryForGeneratedImages:secretName	The name of the secret that was created for the external registry credentials.	Optional field.

#### Server bundles

The following table describes the fields in the workspace custom resource that are used for server bundle properties:

Table 4. Server bundle properties

Field	Description	Additional information
name	The user-defined name for the server bundle.	Required field.

Field	Description	Additional information
isDefault	Indicates whether the default route points to this server bundle in the Manage application workspace.	<p>Required for one of the server bundles in the group. Only one server bundle can be set as the default.</p> <p>You can set isDefault to true only for the following bundle types:</p> <ul style="list-style-type: none"> <li>all</li> <li>ui</li> </ul> <p>If you create only one server bundle and no value is specified in the isDefault field, the server bundle is selected as the default server bundle.</p> <p>If you specify multiple server bundles and no value is specified for the isDefault field, a server bundle with a bundle type of all is selected as the default.</p>
isUserSyncTarget	Indicates whether this server bundle is used for synchronizing Maximo Application Suite users with Manage.	<p>Required for one server bundle. Only one server bundle can be used for user synchronization.</p> <p>You can set isUserSyncTarget to true only for the following bundle types:</p> <ul style="list-style-type: none"> <li>all</li> <li>mea</li> </ul> <p>If you do not specify a user sync target, the default server bundle is used for synchronization.</p>
isMobileTarget	Indicates whether this server bundle can be used for the Maximo Mobile application.	<p>Optional field. Only one server bundle can be used for this application.</p> <p>You can set isMobileTarget to true only for the following bundle types:</p> <ul style="list-style-type: none"> <li>all</li> <li>ui</li> </ul>
replica	The number of pods that you want to create for this server bundle. If you enter a value of 0, no pod is deployed.	Required field.
routeSubDomain	The subdomain for the server bundle. This subdomain is added as a prefix to the main domain. For example, you can specify maximoui as a subdomain, and then your full domain is maximoui.workspaceid.manage.domain.com.	If you have multiple bundles of type ui or all, then you must specify a subdomain for each bundle in order to give users access to the bundle.
bundleLevelProperties	The Manage system properties that you want to apply only to a specific server bundle.	Optional field.
additionalServerConfig.secretName	The secret that contains the additional server.xml file that is applied to the Liberty application server.	Optional field.
jvmOptions	<p>Specifies the JVM options for the Liberty application server for a server bundle. The values for the field must be specified in the format that is shown in the following example:</p> <p><code>-Xms4m\n-Xmx488m\n-XX:MaxPermSize=256m.</code></p>	Optional field.

#### Customization

The following table describes the fields in the workspace custom resource that are used for customization properties:

Table 5. Customization properties

Field	Description	Additional information
customizationArchive	The URL that points to the location of the customization archive.	<p>Optional field.</p> <p>The following URL protocols are supported:</p> <ul style="list-style-type: none"> <li>HTTP</li> <li>HTTPS</li> <li>FTP</li> <li>FTPS</li> </ul>
customizationArchiveCredentials	The credentials that are required to access the customization archive.	Optional field.

#### Server mode

The following table describes the field in the workspace custom resource that is used for mode property for server deployment:

Table 6. Server mode property

Field	Description	Additional information
mode	<p>The state of the Maximo Manage deployment. You can use the following values:</p> <ul style="list-style-type: none"> <li>up - The Maximo Manage servers are running.</li> <li>down - The Maximo Manage servers are not running.</li> </ul>	<p>Required field.</p> <p>The default value is up.</p>

## Persistent volumes

The following table describes the fields in the workspace custom resource that are used for persistent volume properties:

Table 7. Persistent volume properties

Field	Description	Additional information
pvcName	The name of the persistent volume claim that requests storage.	
volumeName	The name of the storage volume that your administrator created.	
size	The amount of storage to claim from the volume storage.	
mountPath	The mount path for the storage volume within the Maximo Manage pod.	
storageClassName	Storage class that your administrator defined for the volume.	

## Build tag

The following table describes the field in the workspace custom resource that is used for the build tag property:

Table 8. Build tag property

Field	Description	Additional information
buildTag	The build that is used for the deployment. By default, the latest build is used when applications are deployed. However, you can specify an earlier build if you do not want the latest build to be deployed.	Required field. The default is <code>latest</code> .  Build images are tagged with a timestamp, as shown in the following example:  <code>buildtag: 202011092887843</code>

## Imported certificates

The following table describes the fields in the workspace custom resource that are used for imported certificates:

Table 9. Imported certificate properties

Field	Description	Additional information
alias	An alternative name for the certificate. The alias must be unique within the workspace.	The list of aliases and certificates represents a complete chain of trust for the host. The certificates are necessary only if the host presents a certificate signed by a certification authority that is not already trusted by Maximo Application Suite.
crt	A single certificate provided in PEM format.	

## Sample Manage workspace custom resource (CR)

```
spec:
 bindings:
 jdbccfg: workspace-application # Manage-workspace level, required.
 #jdbccfg expects connection string, jdbc options, use SSL flag, username, password, certificate

 components: #?where do we provide the description of the component and get it translated? What displayed to the
 #end user are supposed to be description of the component, not necessarily the actual identifier on the CR
 managebase: # The components. It is a variable list. Value come from a predefined list. Some componnet have
 additional configuration
 # should it be a list or like that originall on the playbook
 version: 8.0.0
 nuclear:
 version: 8.0.0
 acm:
 version: 8.0.0
 bindings: #
 bdi: workspace-application # we expect bdi configuration is needed for acm and aviation.
 # how do we specify it is needed?
 version: latest # If latest, operator will choose the default version of the component. Where would be a possible
list comfrom
 # Manage operator maintains a supporte version of add ons based on the manage base version in the
admission
 # webhook.

 settings:
 lanaguges:
 baseLang: EN #optional base language
 secondaryLangs: #optional list of language codes, default empty
 - FR #?a code, a two leter standard? The list coming from the schema validation
 - IT
 customization:
 customizationArchive: https://company.com/customization.zip #optional customization archive that wget can obtained,
no security
 customizationArchiveCredential: secretname #optional secret name and password for wget
 #only support http, https, ftp, ftps with password authentication for now. Additonal method may be
provided in the
 #future.

 db:
 dbSchema: maximo #optional, default to maximo, but typically need input ?should it be in jdbccfg?
 encryptionSecret: <workspaceid>-encryption-secret #?how to indicate this is a secret and have to be certain name?
User enter properties, if not exist, generate default, should we use fixed name or allow user to specify secret?
 maxinst: # optional but typically the databata need to input. Cannot change after deploymet ?How to tell MAS about
it?

## System properties

You can modify the default values for system properties to tailor the system to your needs.

- [Asset properties](#)  
You can use system properties to help manage assets.
- [Attached document properties](#)  
You can specify property values to control the use of attachments in the application.
- [Attachment properties for S3 storage](#)  
You can configure the product so that it stores attachments in a Simple Storage Service (S3) cloud object storage.
- [Automation scripts properties](#)  
You can use system properties to help manage automation scripts.
- [Bidirectional language properties](#)  
You can use system properties to enable and manage bidirectional language support.
- [Bulletin board property](#)  
You can use the property to track viewed and unviewed messages in the bulletin boards.
- [Calendar property](#)  
You can use the property to specify the system base calendar.
- [Classification item properties](#)  
You can use classification items (CI) properties to specify data set provider classes for CI and actual CI.
- [Communication template property](#)  
You can use the property to specify whether bind variables are ignored in the communication templates.
- [Condition property](#)  
You can use the property to list comma-separated table names that are excluded when the reference for a condition is checked.
- [Cron task properties](#)  
You can use properties to manage cron tasks.
- [Database properties in IBM Maximo Manage](#)  
You can use system properties to help manage the database for Maximo Manage.
- [Deployed assets property](#)  
You can use the property to specify the data set provider class for deployed assets.

- [Drill-down system properties](#)  
You can use system properties to enable the optional drill-down user interface and to control the number of objects that are returned when working with drill-down features.
- [Dynamic job plan property](#)  
You can use the dynamic job plan property to give users the ability to create dynamic job plans.
- [Email interaction system properties](#)  
The email interaction system properties define the behavior and characteristics of the emails.
- [Email listener properties](#)  
You can use system properties to help manage email listener properties.
- [Environment properties](#)  
You can use system properties to help manage the system environment.
- [Electronic signature properties](#)  
Electronic signature authentication confirms that a person who modifies a record is the same person who logged in to the system. You can use the system properties to manage the electronic signature feature for your organization.
- [General ledger property](#)  
You can use the property to control the use of the upper function for the GL account in QBE.
- [Guest login properties](#)  
The guest login properties determine the characteristics of unauthenticated access by a guest user.
- [mxs.help properties](#)  
The mxs.help system properties connect the user interface to the help system. Some of the properties are used to construct the link that opens the help system. To ensure that the help system is available, match the values in the mxs.help properties to the help system that you deploy.
- [Internet Explorer Java properties](#)  
You use the Internet Explorer Java™ system properties to specify the version of the Java plug-in that Internet Explorer uses when running applets.
- [Inventory property](#)  
You can use the property to set the maximum inventory usage line limit in an inventory usage document.
- [Issues and transfers property](#)  
You can use the property to open the Long Operation window when an INVISSUE is saved and the processing time is long.
- [Lightweight Directory Access Protocol integration properties](#)  
You can use system properties to manage Lightweight Directory Access Protocol (LDAP) integration.
- [Migration Manager properties](#)  
You use Migration Manager to migrate configuration content from one product environment to another. You can use the properties to control the migration of the configuration content.
- [Reorder property](#)  
You can use the reorder property to manage the reorder time out periods for your organization.
- [Report integration properties](#)  
You can use report properties to control how reports are created and managed in IBM® Maximo Manage. You can identify most report properties if you specify `report` as a filter value in the Description field.
- [Server properties](#)  
You can use the server properties to control how a server operates, such as specifying values for the administration user, for user registration, and email authentication.
- [Side navigation properties](#)  
The side navigation system properties define the behavior and characteristics of how users navigate in the user interface.
- [User interface system properties](#)  
The web client system properties define the behavior and characteristics of the user interface. To review or change system properties, filter for the term `webclient` in the System Properties application. System property values are preserved during upgrades.
- [Utilities for logging and testing](#)  
To help you manage system performance, there are utilities that you can use for testing and debugging purposes. When you are satisfied with your deployment, you can disable these logging utilities.
- [Work order properties](#)  
You can use system properties to help manage work orders.
- [Workflow properties](#)  
You can use workflow properties to specify the email account of the administrator, control status inheritance for work items, and define the maximum number of loops that can occur between condition nodes.

## Asset properties

You can use system properties to help manage assets.

Table 1. Asset properties

Property	Description	Default value
mxs.app.asset.delete AttributesAssetMovedBack	Deletes attributes when an asset is moved back to its original site. The default value is 0 which is no.	0
mxs.assettopology.depth	Represents the maximum depth that you can go in the asset topology.	5
mxs.assettopology.init	Indicates the initial depth for the asset topology.	2
mxs.assettopology.maxnodes	Specifies the maximum number of nodes that can be shown in the asset topology.	200
recon.engine. dataset.map.ASSET	Represents comma-separated data set names that can be reconciled against assets.	DEPLOYED ASSET
recon.engine. dataset.provider.ASSET	Represents the data set provider class for assets.	psdi.app.recontask. engine. dataset.AssetDataS et

Property	Description	Default value
mxe.workorder.rollupMaintenanceCosts	Specifies whether to automatically roll up maintenance costs for assets that are associated with a work order when the work order is closed.	0

## Attached document properties

You can specify property values to control the use of attachments in the application.

Note: If you are configuring the product to store attachments in an S3 cloud object storage, refer to the related link at the end of this document.

Table 1. Attached document properties

Property	Description	Default value
mxe.doclink.deleteOrphanDocinfo	Specifies whether to delete orphaned document information when deleting the last attached document record.	0
mxe.doclink.docTypes.allowedFileExtensions	Specifies the type of attached document files that you can add to the persistent storage volume.  When you complete the system property configurations, restart the server bundle pod to implement the changes.	pdf, zip, txt, doc, docx, dwg, gif, csv, xls, xlsx, ppt, xml, xsl, bmp, html, png, pptx, cfr, mp4, mov, odt, ods, odp, jpg, jpeg, rtf, wmv, wm, wma
mxe.doclink.docTypes.topLevelPaths	Specifies the top-level attachments directory that stores all document folders in your persistent storage volume.  The Default File Path value entered in the Manage All Documents Folder window must be a subdirectory of this value.  This value cannot be null.  When you complete the system property configurations, restart the server bundle pod to implement the changes.	The default location is the top level directory on the persistent storage volume. For example: \DOCLINKS.
mxe.doclink.path01 through mxe.doclink.path10	Specifies the HTTP server path to link documents that are attached to records.  This property needs a live refresh only.	
mxe.doclink.docTypes.defpath	Specifies the default path for the directory that you set up for attached documents on your persistent storage volume. Your documents are stored in this directory.  This value must be configured before you can use the system and needs a live refresh only.	
mxe.doclink.printURLAttachments	Specifies whether you can print URL attachments.	0
mxe.doclink.maxfilesize	Represents the maximum file size in megabytes that you can add to the attached documents directory.	Use the default value of 10 MB (10 = 10 MB) or replace it with a lesser value.  Do not set the maximum file size to a value that exceeds your system, network, or persistent volume capacity limits. If you do, a system error, OutOfMemory, occurs. To correct this error, change the value to less than 10 MB.  If the value is set to 0, the system allows all file sizes to be uploaded. However, you might get OutOfMemory errors if you upload a large file size that exceeds system capacity. To correct this error, change the value to less than 10 MB.
mxe.doclink.multiples.aix.websphere	Does not apply.	False
mxe.doclink.multiples.hpux.websphere	Does not apply.	False
mxe.doclink.multiples.linux.websphere	Does not apply.	False
mxe.doclink.multiples.solaris.websphere	Does not apply.	False
mxe.doclink.multiples.windows.websphere	Does not apply.	False
mxe.doclink.defaultPrintDocWithReport	Specifies whether printable attachments are printed by default when you print a report.	True

Property	Description	Default value
mxe.doclink.useFilePrompt	Enables a browse icon to select file attachments that are not copied to the default location.	0
mxe.doclink.securedAttachment	To keep your documents secure, set this property to <code>true</code> to prevent the application from displaying the file path of attached documents. The application displays only the content root and the file name.  Setting the property to <code>true</code> makes all attached document requests go through the Manage server instead of an HTTP web server and adds an additional layer of security to the stored documents.  For Manage deployments on Red Hat® OpenShift®, set this property to <code>true</code> .	False
mxe.doclink.securedAttachmentDebug	Helps you to troubleshoot when you are using secured attachments to view the attachment file.  When security for the attachments is active and you set the value for this property to <code>true</code> , the attached file name and file path are displayed in the server log.	False
mxe.doclink.FileValidationClass	Configure this parameter if you want to implement file type scanning when you upload an attached document. The class must be registered with this property in order to implement <code>com.ibm.tivoli.maximo.doclink.AbstractFileVerification</code> .	
proxy_hostname	Indicates the external host that enables direct printing.	
proxy_port	Indicates the external port that enables direct printing.	

The following table provides an example of properties for attached document paths and properties.

Table 2. Examples of values for attached document properties

Property	Sample value
mxe.doclink.maxfilesize	10
mxe.doclink.doctypes.defpath	Specify the default path for your persistent storage volume. For example, <code>C:\DOCLINKS\</code>
mxe.doclink.path01	Specify the path to the directory that you set up in your persistent storage volume. For example: Windows: <code>\doclinks</code>  UNIX: <code>/d01/doclinks</code>  <code>C:\Doclinks=http://documentserver/</code>

## Related reference

- [Attachment properties for S3](#)

## Attachment properties for S3 storage

You can configure the product so that it stores attachments in a Simple Storage Service (S3) cloud object storage.

Table 1. Properties for storing attachments in S3 cloud object storage

Property	Description	Value
mxe.cosaccesskey	The S3 access key.	Obtain this value from your S3 configuration.
mxe.cossecretkey	The S3 secret key.	Obtain this value from your S3 configuration.
mxe.cosendpointuri	The S3 endpoint URI that is used to access the S3 storage by the API.  Check with the COS provider for the proper URI syntax.  For example, for Amazon Simple Storage Service (S3), the value is <code>https://s3.region.amazonaws.com</code> .  For IBM Cloud Object Storage, the value is <code>https://s3.us.cloud-object-storage.appdomain.cloud</code> .	Obtain this value from your S3 configuration.
mxe.cosbucketname	The name of the S3 storage bucket where attachments are stored, for example, <code>mxe.cosbucketname=maximoattachments</code> .	Obtain this value from your S3 configuration.
mxe.attachmentstorage	The class that implements the S3 storage protocol. The product provides an implementation of the S3 storage protocol.	Always set to <code>com.ibm.tivoli.maximo.oslc.provider.COSAttachmentStorage</code> .
mxe.doclink.securedAttachment	For security, this property hides the file path of documents that were added by the Attached Documents feature.  Set this property to <code>true</code> so that the hyperlink for the attachment shows the application content root and the encrypted file name only.	Always set to <code>true</code> .  If this property is not set to <code>true</code> , other attachment storage protocols do not function.
mxe.doclink.doctypes.defpath	The default path for the doclinks folder where the attachments are stored. This path is a fixed value.	Always set to <code>cos:doclinks\default</code> for S3.
mxe.doclink.doctypes.topLevelPaths	The path to the top-level directory for document folders. This path is a fixed value.	Always set to <code>cos:doclinks</code> for S3.

Property	Description	Value
mxe.doclink.path01	The HTTP server path to link documents that are attached to records. This path is a fixed value.	Set this to match the URL of your UI server. For example, <code>cos:doclinks=https://host/maximo/oslc/cosdoclinks</code> .

## Automation scripts properties

You can use system properties to help manage automation scripts.

Table 1. Automation script properties

Property	Description	Default value
mxe.script.attributelevel	Represents the maximum relationship depth for a launch point variable with ATTRIBUTE binding type.	3
mxe.script.drivers	Represents a comma-separated list of script drivers that is useful when any custom, none JSR223 compliant, script engine needs to be plugged into the script framework.	com.ibm.tivoli.maximo.script.JSR223ScriptDriver
mxe.webclient.autoscript.uscriptide	Enables a rich text editor to edit your automation scripts. The editor has features, such as syntax highlighting and auto-completion, that improve usability.	1

## Bidirectional language properties

You can use system properties to enable and manage bidirectional language support.

Table 1. Bidirectional language properties

Property	Description	Default value
mxe.bidi.support.on	Indicates whether bidirectional support is enabled.  If the value is empty, illegal or 0, the bidirectional support code is not enabled. A value of 1 indicates that the bidirectional support is enabled.	
mxe.bidi.text.direction	When bidirectional support is enabled, this property indicates that the base text direction of text which appears on the GUI is enforced.  The value which is enforced is stored in this property. This property is the system level property for base text direction. There is also a Maximo® business object and a Maximo business object attribute level for the base text direction property.  The values for this property are: <i>LTR</i> , <i>RTL</i> , or contextual values.	

## Bulletin board property

You can use the property to track viewed and unviewed messages in the bulletin boards.

The bulletin board property is PMBBISTRACKED. This property is used to set the global variable for bulletin boards to track viewed or unviewed messages. The default value is 1.

## Calendar property

You can use the property to specify the system base calendar.

The calendar property is mxe.baseCalendar. This property indicates the type of calendar that is defined as the system base calendar. The default value is gregorian.

## Classification item properties

You can use classification items (CI) properties to specify data set provider classes for CI and actual CI.

Table 1. Classification item properties

Property	Description	Default value
recon.engine.dataset.map.CI	Represents comma-separated data set names that can be reconciled against CI.	ACTUAL CI
recon.engine.dataset.provider.ACTUAL CI	Represents a data set provider class for actual CI.	psdi.app.recontask.engine.dataset.ActualCIDataset
recon.engine.dataset.provider.CI	Represents a data set provider class for CI.	psdi.app.recontask.engine.dataset.CIDataset

---

## Communication template property

You can use the property to specify whether bind variables are ignored in the communication templates.

The communication template property is `mxe.comm.ignoreunresolvedbindings`. This property ignores unresolved bind variables in the communication templates. The default value is 0.

---

## Condition property

You can use the property to list comma-separated table names that are excluded when the reference for a condition is checked.

The condition property is `mxe.condition.excludeCheckReference`. This property represents comma-separated table names that are excluded when the reference for a condition is checked. There is no default value.

---

## Cron task properties

You can use properties to manage cron tasks.

Table 1. Cron task properties

Property	Description	Default value
<code>mxe.crontask.corepoolsz</code>	Represents the cron task thread pool size for core threads.	20
<code>mxe.crontask.coretthreadtimeo</code>	Sets the policy governing whether core threads may time out and terminate if no tasks arrive within the keep-alive time, being replaced if needed when new tasks arrive.  When <code>mxe.crontask.coretthreadtimeo</code> is set to 0, core threads are never terminated due to lack of incoming tasks.  When <code>mxe.crontask.coretthreadtimeo</code> is set to 1, the same keep-alive policy applies to both core and non-core threads. The setting for the <code>mxe.crontask.keepalivetime</code> property is used to determine how many seconds elapse before a thread times out.	0
<code>mxe.crontask.deleteBB</code>	Removes expired bulletin board records.	0
<code>mxe.crontask.donotrun</code>	Use ALL to exclude all cron tasks from running.  To exclude a specific cron task from running, specify the <code>crontaskname.instance</code> instance.	
<code>mxe.crontask.dorun</code>	Indicates that all cron tasks should run.	
<code>mxe.crontask.historycleanu</code>	Determines how often, in minutes, the excessive cron task history records are removed.  There is no action if the value is set to 0.	180
<code>mxe.cronTaskInitDelay</code>	Represents the cron task monitor initialization delay in seconds.  After the system server starts, this property determines the amount of time before the server initializes the cron task.	60
<code>mxe.cronTaskMonitorInterval</code>	Determines the time intervals at which the cron task manager monitors the statuses of the cron tasks.	60
<code>mxe.crontask.keepalivetime</code>	Represents the cron task thread pool keep-alive time for inactive threads.	

---

## Database properties in IBM Maximo Manage

You can use system properties to help manage the database for Maximo® Manage.

Table 1. Database properties

Property	Description	Default value
<code>mxe.db.closeongrunconn</code>	A Boolean flag that indicates that the long running connection needs to be closed.	false
<code>mxe.db.DB2jdbcCollection</code>	Represents the DB2® Java™ database connectivity (JDBC) collection. The <code>NULLIDR1</code> value activates query optimization REOPT ONCE.	
<code>mxe.db.DB2LDTextCaseInsensitiveSearch</code>	When set to 1, the DB2 search on Long Description field is not case-sensitive. Might cause performance delay.	0
<code>mxe.db.detectlongrunconninterval</code>	Checks the long running connection. The interval is reflected in minutes. A value of (0, 30] is treated as 30.	0

Property	Description	Default value
mxe.db.disableServercursor	Used to disable the server cursor.	1
mxe.db.fetchResultLogLimit	Determines the typical or largest fetch count for every object.  A stack trace is created in the log file of the application server logs every time a multiple of the fetch log limit is reached. For example, if you set the property to 1000, the stack trace is logged at the 1000th record, the 2000th record, and so on.	5000
mxe.db.fetchResultStopLimit	Represents the fetch stop limit used when checking that the fetch stop limit is enabled. The limit applies to all objects for which a specific fetch stop limit property is not specified.  A value of -1 means that there is no limit.	5000
mxe.db.fetchsize	Represents the size of the database fetch.	40
mxe.db.fetchsizeuse	Represents the flag that indicates whether to use the fetch size.	1
mxe.db.fetchStopExclusion	Provides a comma-separated list of object names. If an object name is in the list, the fetch stop limit check is disabled for the object. If an object name is in the list and the same object is specified in an mxe.db.fetchResultStopLimit.OBJECTNAME property, the exclusion overrides the other property.  The values are represented in a comma-separated object name list in the MAXOBJECT table.	
mxe.db.fetchStopLimitEnabled	Enables or disables the checking of the fetch stop limit.  Use 0 to disable and use 1 to enable.	1
mxe.db.format.date	Determines the database date function.  A value of none tells the system to pass through the date value.  You cannot change this value.	
mxe.db.format.nullvalue	Represents the database-specific format of the null value function.	<ul style="list-style-type: none"> <li>For IBM® DB2, the value is <i>COALESCE</i>, and you cannot change the default value.</li> <li>For Oracle, the value is <i>NVL</i>, and you cannot change the default value.</li> <li>For SQL Server, the value must be set to <i>ISNULL</i>.</li> </ul>
mxe.db.format.time	Represents the database time function.  A value of none indicates that the time value is passed through.  You cannot change the default value.	
mxe.db.format.timestamp	Represents the database time stamp function.  A value of none indicates that the time stamp value is passed through.  You cannot change the default value.	
mxe.db.format.upper	Defines the database uppercase function for the system.  You cannot change this value.	Upper
mxe.db.initialConnections	Represents the number of database connections that are created when the application server is started.	8
mxe.db.logCorrelationid	Disables database cursor sharing. You can add the correlation ID as an SQL comment. Use the property only in debug mode.	0
mxe.db.logSQLPlan	Represents the log execution plan for full table scans.	0
mxe.db.longrunlimelimit	Indicates the time limit, in minutes, to close the long running connection.	180
mxe.db.logSQLTimeLimit	Represents the log that contains the SQL operations that exceed the time limit in milliseconds.	1000

Property	Description	Default value
mxe.db.lookupMaxRow	Represents the maximum number of records queried from database for lookups.	1000
mxe.db.lookupMultiplier	Used in conjunction with the mxe.db.lookupMaxRow property to show items.	5
mxe.db.maxFreeConnections	Represents the maximum number of free database connections that are available in the connection pool.	8
mxe.db.minFreeConnections	Represents the minimum number of free database connections that are available in the connection pool.	5
mxe.db.MLQBELooseSearchWOJoin	Used for Oracle only. Do not use outer join for search on a multiple language enabled field.	0
mxe.db.newConnectionCount	Represents the number of new connections to be created when the minimum free connections are available in the connection pool.	3
mxe.db.optionnum	Represents the size of the option.	1000
mxe.db.optionuse	Represents the flag that indicates whether to use the OPTION FAST feature for Microsoft SQL Server. You use this property with the mxe.db.optionnum property, which specifies the number of rows that are quickly retrieved from the database.	1
mxe.db.QueryTimeout	Represents the amount of time in seconds before the SQL query times out and is stopped.	300
mxe.db.refcount	Represents the reference count for the connection log.	100
mxe.db.resultsettype	<p>The constant indicates the type for a result set object with the following characteristics:</p> <ul style="list-style-type: none"> <li>The cursor can move only forward. For example:  <code>TYPE_FORWARD_ONLY</code>  <code>public static final in TYPE_FORWARD_ONLY</code> </li> <li>The result set type that is scrollable, but not sensitive to changes that other users make. For example:  <code>TYPE_SCROLL_INSENSITIVE</code>  <code>public static final int TYPE_SCROLL_INSENSITIVE</code> </li> <li>The result set type that is scrollable and sensitive to changes that other users make. For example:  <code>TYPE_SCROLL_SENSITIVE</code>  <code>public static final int TYPE_SCROLL_SENSITIVE</code> </li> </ul>	TYPE_FAST_FORWARD
mxe.db.retrydbconnection	Reconnects to the database when you start the application server.	0
mxe.db.rowcount	Represents the SQL Server row count value.	0
mxe.db.sqlinjection	Indicates whether the SQL injection check is enabled.	1
mxe.db.sqlserverPrefetchRows	<p>Represents the setting to reduce lock contention and is only for SQL Server.</p> <p>The optimal setting is 200 rows. Setting a value larger than 500 can degrade performance.</p>	0
mxe.db.sqlTableScanExclude	Indicates tables that should not have an execution plan logged.	
mxe.db.systemdateformat	Represents the system date format.	<ul style="list-style-type: none"> <li>For IBM DB2, the value is current timestamp</li> <li>For Oracle, the value is sysdate, and you cannot change the default value.</li> <li>For SQL Server, the value is getdate.</li> </ul>

Property	Description	Default value
mxs.db.transaction_isolation	The installation sets the value to: TRANSACTION_READ_COMMITTED. You cannot change this value.	TRANSACTION_READ_COMMITTED
mxs.db.updateWithoutRowstamp	Indicates that you can allow updates on tables that do not contain a rowstamp column.	0
mxs.db.UseSiteListInQuery	Represents the use literal list for site and organization restrictions.	0
mxs.dbmanager	References the Java class of the Maximo database manager.  This property also requires that you specify the jdbc database connection string as the Oracle call interface (OCI) connection string, and that you make the OCI driver accessible to the system web component Java virtual machine (JVM).	The default value is <i>psdi.server.DBManager</i> .  If you have an Oracle database that requires proxy authentication, set this property to <i>psdi.server.OracleProxyDBManager</i> .
mxs.dbwatchdog.adminemail	Represents the administrator email address used to send the database connection watchdog mail.	
mxs.dbwatchdog.logInterval	Represents the interval time in minutes between when each database connection watchdog log is created. The database connection watchdog log is written to the database connection logger.	10
mxs.dbwatchdog.mailinterval	Represents the interval in minutes before a watchdog email is sent to the administrator.	60

## Deployed assets property

You can use the property to specify the data set provider class for deployed assets.

The deployed assets property is `recon.engine.dataset.provider.DEPLOYED_ASSET`. This property represents the data set provider class for deployed assets. The default value is `psdi.app.recon.task.engine.dataset.DPADataset`.

## Drill-down system properties

You can use system properties to enable the optional drill-down user interface and to control the number of objects that are returned when working with drill-down features.

Table 1. Drill-down properties

Property	Description	Default value
mxs.webclient.drilldown.fetchsize	Specifies the fetch size per node. Child objects are fetched in batches regardless of the type.	50
mxs.webclient.drilldown.fetchlimit	Specifies the fetch limit per node type. For any node, the fetch limit specifies the maximum number of child objects that are fetched for each relationship. For example, by default a location node can have 50 child locations, 50 assets, 50 preventive maintenance records, and so on.	50
mxs.webclient.extendedDrilldown	Enables an optional, extended drill-down user interface for assets and locations that displays a single, hierarchical view.	false

## Dynamic job plan property

You can use the dynamic job plan property to give users the ability to create dynamic job plans.

The `dynamicjobplan` property is a system property that enables the creation of dynamic job plans. The default value is 0.

## Email interaction system properties

The email interaction system properties define the behavior and characteristics of the emails.

## Mail key properties

The @@MAILKEY@@ string specifies the appropriate signature string in the subject line of emails. For each configuration of email interaction, at least one of the following properties is included in the @@MAILKEY@@ property:

Property	Configuration type
mxe.mfmail.STSignatureSimple	Object status change with a simple email format
mxe.mfmail.STSignatureAdvanced	Object status change with an advanced email format
mxe.mfmail.WFSignatureSimple	Workflow assignment with a simple email format
mxe.mfmail.WFSignatureAdvanced	Workflow assignment with an advanced email format

## Email body properties

The following system properties are specified in the body of the emails that are sent in email interaction:

Property	Description
mxe.mfmail.ValueListBegin	Marks the beginning of the prompt section
mxe.mfmail.ValueListEnd	Marks the end of the prompt section
mxe.mfmail.AssistMarker	Identifies the characters that precede the prompt numbers
mxe.mfmail.LineSize	Indicates the line size in the email. The default is 72.
mxe.mfmail.adminEmail	Indicates the email address of the administrator to notify when errors occur that require administrative action. This property is optional
mxe.email.convertToPlainText	Converts the email into plain text.

## SMTP property

The mail.smtp.starttls.enable property affects all features that send email such as password changes.

Property	Description
mail.smtp.starttls.enable	Enables the use of the STARTTLS command if it is supported by the SMTP server. The default value is false.

## Email listener properties

You can use system properties to help manage email listener properties.

Table 1. Email listener properties

Property	Description	Default value
mxe.listener.rfc822depth	Represents the number of levels required to retrieve attachments from a message file.	3
mxe.listener.rfc822extension	Represents the file extension for the message file that is downloaded.	
mxe.isnr.validateperson	Indicates whether a person needs to be validated in the Email Listener application.	1

## Environment properties

You can use system properties to help manage the system environment.

Table 1. Environment properties

Property	Description	Default value
mxe.allowLocalObjects	In production environments, this property is set to true to improve system performance. You set this property to false for development work or for custom applications.	1
mxe.app.inventor.updateReservations	When material issues are not run by the Select Reserved Items action, this property updates the reservations.	0
mxe.enableConcurrentCheck	Allows multiple logins on the same user account. By default, the property has a value of 0. To change the value, specify 1 for the property when you configure bundle-level properties during the deployment process. You set this property to true (1) to prevent multiple logins on the same user account. Before you create users, set this property to 1.	0
mxe.isFederal	Hides the Federal notice when you log in.	0
mxe.isSaaSEnabled	Indicates that SaaS is enabled.	0
mxe.MLCacheLazyLoad	Represents the multiple-language metadata cache which loads 1 object at a time. You set this property to 1 to load all objects simultaneously for 1 language.	1
mxe.useAppServerSecurity	Represents the security that your configuration uses. By default, the security for the system is used. You set this property to true if your configuration uses security provided by an application server.	0

Property	Description	Default value
mxe.UserLicenseKey	Represents the product enabler (license key) that is used during installation. If the product enabler changes, you must update the value of this property.	

## Electronic signature properties

Electronic signature authentication confirms that a person who modifies a record is the same person who logged in to the system. You can use the system properties to manage the electronic signature feature for your organization.

The following table shows the electronic signature properties and their default values:

Table 1. Electronic signature properties

Property	Description	Default value
mxe.allownativeesig	Specifies whether electronic signature authentication is enabled. This feature is enabled and enablement should not be changed.	1
mxe.esigresete-mailfrom	Specifies the email address that sends a message to inform users when their electronic signature key is reset.	None. Specify the email address that your organization uses to inform users when their electronic signature key is reset, for example system@example.com.

## General ledger property

You can use the property to control the use of the upper function for the GL account in QBE.

The general ledger property is mxe.upperGLValues. This property controls the use of the upper function for the GL account in QBE. The default value is 0.

## Guest login properties

The guest login properties determine the characteristics of unauthenticated access by a guest user.

Property name	Description	Default value
mxe.webclient.guestLoginEnabled	Enables unauthenticated access.	0
mxe.system.guestuser	Enables the guest user ID	Empty string
mxe.system.guestpassword	Enables the guest password	Empty string
mxe.webclient.guestLoginURL	The URL of the page to load when the user clicks the Login as Guest button	../login/guestlogin.jsp

## mxe.help properties

The mxe.help system properties connect the user interface to the help system. Some of the properties are used to construct the link that opens the help system. To ensure that the help system is available, match the values in the mxe.help properties to the help system that you deploy.

Table 1. Help system properties

Property	Description	Default value
mxe.help.host	Represents the host name or IP address of the help system.	127.0.0.1
mxe.help.path	Represents the path that is inserted between the help system port and the topic when the link to the help system is constructed.	/help/
mxe.help.port	Represents the port of the help system.	9080
mxe.help.protocol	Represents the protocol of the information system (HTTP or HTTPS).	http

## Internet Explorer Java properties

You use the Internet Explorer Java™ system properties to specify the version of the Java plug-in that Internet Explorer uses when running applets.

Property name	Description	Default value
mxe.javaApplet.ClassidNoMinimum	Identifies which minimum version of Java plug-in to use and instructs Internet Explorer to use the highest install version.	8AD9C840-044E-11D1-B3E9-00805F499D93
mxe.javaApplet.Classid	Identifies which minimum version of Java plug-in to use. This is an alternative form of the classid attribute where the minimum version of Java plug-in is specified.	CAFEEFAC-0017-0000-0000-ABCDEFEDCBA

Property name	Description	Default value
mxjavaApplet.Cobase	Specifies where to download the Java SE Runtime Environment. This property value is prefixed with the protocol.	http://java.sun.com/update/1.7.0/jinstall-7-windows-i586.cab#Version=1,7,0,0
mxjavaApplet.CobaseNoProtocol	Specifies where to download the Java SE Runtime Environment. This property value is not prefixed with any protocol.	java.sun.com/update/1.7.0/jinstall-7-windows-i586.cab#Version=1,7,0,0
mxjavaApplet.Type	Specifies the applet type. Also specifies that a Java SE Runtime Environment with at least the specified update version provided by the value of jpi-version is invoked to run the applet.	application/x-java-applet;jpi-version=1.7+

## Inventory property

You can use the property to set the maximum inventory usage line limit in an inventory usage document.

The inventory property is `mx.inventory.maxInvUseLineLimit`. This property represents the maximum inventory usage line limit in an inventory usage document. The default value is 250.

## Issues and transfers property

You can use the property to open the Long Operation window when an INVISSUE is saved and the processing time is long.

The issues and transfers property is `mx.app.inviissue.doLongOpOnSAVE`. This property opens the Long Operation window when an INVISSUE is saved. There are two values: 0 that opens the HourGlass or 1 that open the Long Operation window. The default value is 0.

## Lightweight Directory Access Protocol integration properties

You can use system properties to manage Lightweight Directory Access Protocol (LDAP) integration.

Table 1. LDAP integration properties

Property	Description	Default value
mx.allowLDAPUsers	Indicates whether LDAP users are allowed into the system if they do not have a user record.	0
mx.ClientCountMinutes	Represents the interval in minutes for counting sessions.	15
mx.LDAPMaxErrors	Represents the maximum number of errors for LDAP or virtual machine manager (VMM) synchronization.	1000
mx.LDAPUserMgmt	Indicates whether LDAP owns user management when <code>mx.userAppServerSecurity = 1</code> .	1

## Migration Manager properties

You use Migration Manager to migrate configuration content from one product environment to another. You can use the properties to control the migration of the configuration content.

Table 1. Migration Manager properties

Property	Description	Default value
mx.dm.autoapprovepkgdef	Represents the Migration Manager auto approval of package definitions.	0
mx.dm.collvalidlevels	Represents the maximum number of levels searched to find related records.	5
mx.dm.collvalidsrcexclude	Specifies the source object, attribute, and value combinations that cannot be traversed to.	MAXINTOBJCOLSMAXINTOBJALIAS
mx.dm.collvalidtgtexclude	Specifies the target object and attribute combinations that cannot be traversed from during validation.	MAXINTOBJECT.USEWITH, MAXRELATIONSHIP.CARDINALITY, CRONTASKINSTANCE.SCHEDULE
mx.dm.continueonerror	Continues the Migration Manager deployment when an error is found.	0
mx.dm.dbserver	Represents the database server name for Oracle 9.x.	
mx.dm.dmroot	Represents the name of the Migration Manager root folder that is on the application server computer. This folder stores Migration Manager package files. You must configure this property before using Migration Manager.	
mx.dm.dmsessiontimeout	Represents the timeout value of the Migration Manager HTTP session in minutes. When a long-running Migration Manager task (such as package creation or package deployment) starts, the timeout value for the session of the user who is currently logged in changes to the value specified by this property.	120

Property	Description	Default value
mxe.dm.dmstagecommit	Specifies the commit interval for records that are inserted into the staging table in the target environment for the Migration Manager.  The value is specified in the source environment, and Migration Manager uses the value when distributing a package from the source database to the target database.	1 The default value indicates that the commit interval occurs for every (1) record.
mxe.dm.importlimit	Represents the collection import limit.	100
mxe.dm.previewfreememorythreshold	Represents the memory threshold in percentage before the preview operation stops.	20

## Reorder property

You can use the reorder property to manage the reorder time out periods for your organization.

The reorder property is mxe.reorder.previewtimeout. This property represents the reorder preview time out period in minutes. This property is similar to the web server session time out. The default value is 30 minutes.

## Report integration properties

You can use report properties to control how reports are created and managed in IBM® Maximo® Manage. You can identify most report properties if you specify `report` as a filter value in the Description field.

Table 1. Report properties

Property	Description	Default value
mxe.directprint.inherited.attachments	Specifies whether inherited documents are enabled for printing by using the Direct Print with Attachments function.  Used for direct print with attachments.	0
mxe.directprint.javaconsole.debug	Enables you to output to Java™ Console for troubleshooting.	0
mxe.directprint.printtime.wait	Indicates the maximum duration in seconds the current print process waits before moving to the next process.	600
mxe.report.AttachDoc.validateURL	Determines whether the URL of the attached document needs to be validated before printing the document.  For Manage, set this property to 0.	1
mxe.report.birt.aliaspattern	Pattern used to support using extended fields in the report where clause.	\b(inner outer left right join on where)\b
mxe.report.birt.cancelreportinterval	Determines how frequently, in seconds, the server checks that reports are canceled on the database.  Used in clustered environments where the report administrator might cancel a report on a different server from where the report is running.	20
mxe.report.birt.disablequeuemanager	Defines whether the queue manager is enabled. If the queue manager is disabled (value set to 1), scheduled reports are not run on the server.  Used for multi-server configurations, performance maintenance.	0
mxe.report.birt.maxconcurrentrun	Manages the number of immediate and scheduled Business Intelligence Reporting (BIRT) reports that can be run concurrently  Used for performance maintenance.	5
mxe.report.birt.queueidletimeseconds	Frequency, in seconds, that the queue manager polls the queue for new report jobs.  Used for performance maintenance.	60
mxe.report.birt.PrintSeparateRecord	Enables you to print on both the front and back of a sheet of paper and to print each record separately.	0
mxe.report.birt.viewerurl	For users with one or more BIRT Report Only Servers (BROS), specifies the network address of the BROS cluster.  Use one of the following formats:  http://host[:port]/web-context/report https://host[:port]/web-context/report  For example:  https://ibmhost/maximo/report	
mxe.report.adhoc.editWithGroupAccess	Enables you to edit an ad hoc report when any security group has access to the report.	0

Property	Description	Default value
mxe.report.cognos.content.store.package.location	Represents the content store folder where the Cognos® package is published.	
mxe.report.cognos.datasource	Represents the Maximo data source name that is used by the Cognos adapter.	
mxe.report.cognos.db.schemaName	Represents the Maximo database schema name that is used by the Cognos adapter.	
mxe.report.cognos.db.sql.name	Represents the Maximo database name where the database type is SQL-Server.	
mxe.report.cognos.db.type	Represents the Maximo database type that is used by the Cognos adapter.	
mxe.report.cognos.maxappurl	The Maximo web application URL for Cognos users.	
mxe.report.cognos.namespace	Represents the Cognos namespace which holds information about users, security groups, and roles.	
mxe.report.cognos.serverURL	Represents the Cognos dispatcher/gateway URI. The property is used to launch Cognos reports or administration.	
mxe.report.custom.rptServerLoginPass	Represents the password used to log on to the external report server.	
mxe.report.custom.serverURL	Represents the URL for custom report applications.	
mxe.report.directprint.papersource.selection	Choose the paper source by PDF page size.	0
mxe.report.DisableHyperlinkExport	Disable hyperlinks from exported report contents in various file types including xls and pdf.	1
mxe.report.MaxReportLimits	Use the maximum value for report security limits when the user is in multiple security groups.	1
mxe.report.passDatabase	Pass the database information and password from Maximo to the report server.	1
mxe.report.passEncryptedWhere	Encrypt the value of the reporting where clause before passing to the report engine.	1
mxe.report.passMaximo	Pass the Maximo user's encrypted password from Maximo to the report server.	1
mxe.report.passSMTP	Pass the SMTP host name from Maximo to the report server.	1
mxe.report.reportsInAPage	Defines the number of reports that display in the Report window.	5
mxe.doclink.defaultPrintDocWithReport	Represents the default value for printing an attached document with report if printable type. Used for direct print with attachments.	True
webclient.hideUnauthorizedReports	Hide unauthorized reports.	0

## Additional report properties

Depending on your external reporting system, you might need to specify additional property values. You can add properties in the System Properties application.

## Server properties

You can use the server properties to control how a server operates, such as specifying values for the administration user, for user registration, and email authentication.

Table 1. Server properties

Property	Description	Default value
mail.mime.decodefilename	Represents the name of the JavaMail property that controls decoding of MIME file names.	true
mail.mime.decodeext.strict	Represents the JavaMail property that controls decoding of MIME encoded words.	false
mail.smtp.host	Represents the name of the host that runs the SMTP server. This name is needed for facilities that use email notifications, such as workflow notifications, email, and any error message notifications. Your network administrator can provide this address.	na.relay.ibm.com
mail.smtp.sendpartial	Indicates that partial emails are sent to valid email addresses.	1
mail.smtp.ssl.enable	Enables SSL over SMTP.	false
mail.smtp.starttls.enable	Enables STARTTLS over SMTP.	false
maximo_extended_host	Represents the Maximo® extended host.	
maximo_extended_host_protocol	Represents the Maximo extended host protocol.	
mxe.adminEmail	Represents the email address that is used if the user does not specify an email address in the labor record. This value is requested during installation.	
mxe.adminmode.logoutmin	Represents the number of minutes that users must log out before the application server is placed in Admin mode. Admin mode is used to configure the database (including the application of structural changes).	5
mxe.adminmode.numsessions	Represents the number of administrative sessions that are allowed after the application server is placed in Admin mode.	5
mxe.adminPasswd	Represents the password for the administrative user.	maxadmin

Property	Description	Default value
mxadminPassword	Represents the password for the administrative user.	maxadmin, the system login ID of the administrative user.
mxadminUserCredential	Represents the credential of the administrative user.	
mxadminuserid	Represents the administrative user. This user must have access to all sites. The server uses this property for administrative tasks and to run cron tasks.	maxadmin
mxadminUserLoginID	Represents the system login ID for the administrative user.	maxadmin
mxcom.port	Represents the com port.	
mxconvertloginid	This property identifies whether the login id that the user entered must be converted to uppercase before it is validated.  For conversion, set the value to 1.	0 - do not convert
mxemail.charset	Represents the character set for email notifications that are sent.  When this property is defined, the character set is used to encode the subject and the message when an email notification is sent. For non- English environments, you must set the UTF-8 character.	
mxemail.contentType	used to set the content type for all communications.	text/html
mxhostname	Represents the name of the workstation and port that hosts the MXServer.	localhost:7001
mxmaxsequencecheck	Indicates whether to check for multiple sequence values before using.	0
mxretainrecord	Retains the state of the application tab child tables during editing (less than retainreclimit).	1
mxretainrecordlimit	Represents the maximum number of records for which the table can retain its state.  A higher number can affect performance.	200
mxsmtp.connectiontimeout	Represents the socket connection timeout value in milliseconds.	180000
mxsmtp.password	Defines the password for email authentication. This property must be used with mxsmtp.user property.	Null - disables email authentication.
mxsmtp.timeout	Represents the socket I/O timeout value in milliseconds.	180000
mxsmtp.user	Defines the user ID for email authentication. This property must be used with mxsmtp.password property.	Null - disables email authentication.
mxsystem.DomainFactoryNameProvider	Represents the class path that provides the DomainInfoFactory class names used when initializing domains.	psdi.mbo.DomainFactoryNameProvider
mxsystem.IntegerQBEsearchCommaAsOr	Enables you to search for integers that are separated with a comma.  If the property is disabled and you specify 1,234, only a value of 1234 is returned. To return the values 1 or 234, you must specify =1,=234.  If the property is enabled and you specify 1,234, a value of 1 or 234 is returned.	0
mxsystem.regpassword	Represents the user registration login password.  This value is requested during installation.	maxreg
mxsystem.reguser	Represents the user registration login name to register a user. The user name that is specified must have authorization to create new users.  This value is requested during installation.	maxreg
mxsystem.usingLoadBalancer	Indicates whether a load balancer is used.	0
mxusermonitor.frequency	Indicates the sleep frequency.	60
mxusermonitor.InactiveSessionTimeLimit	Represents the time that an inactive session remains in the MAXSESSION table.	120
mxusermonitor.timeout	Represents the session timeout period, in minutes, on the server to clear the cache.	30
mxuserrestrictionlruCachesize	Manages the number of entries in the LRU cache that stores the restriction entries.	1000
WAS.LTAURL	Represents the URL used to start the Log and Trace Analyzer.	/ibm/action/launch?pageID=com.ibm.ac.lta.web.ui.LogAnalyzer&showNavArea=false
mxserver.enableCSRFBlocking	Enables checks for the CSRF security token.	1
mxservice.runlist	Represents comma-delimited services that must be run.	
mxsessiontoken.timeOutseconds	Represents a token-based session timeout in seconds. This token is used when the user ID is being authenticated on the report server.  The session token timeout setting code is generic and currently only BIRT Reporting uses this function.  Used for BIRT Report Only Server (BROS) configuration	180 seconds

## Side navigation properties

The side navigation system properties define the behavior and characteristics of how users navigate in the user interface.

Property name	Description	Default value
mxe.webclient.hideOnNavBar	Specifies a comma delimited list of events that are not allowed as navigation bar items. No property allows all.	NEXT, PREVIOUS, NAVHISTORY, STRELOCK
mxe.webclient.showOnToolbar	Specifies a comma delimited list of events that are allowed as toolbar items. No property allows all.	INSERT, SAVE ,CLEAR, PREVIOUS, NEXT, NAVHISTORY, STRELOCK
mxe.webclient.ShowQueriesInToolBar	Shows queries in a menu that is accessed from the toolbar.	0
mxe.webclient.showSelectActionInToolBar	Indicates whether the Select Action menu is shown in the toolbar.	0
mxe.webclient.systemNavBar	Set to 1 to display the side navigation menu.	1

## User interface system properties

The web client system properties define the behavior and characteristics of the user interface. To review or change system properties, filter for the term **webclient** in the System Properties application. System property values are preserved during upgrades.

Property name	Description	Default value
mxe.webclient.503_retry-after	Specifies the number of seconds before a retry is attempted when an HTTP connection is not successful. The retry-after value is added to the header of the HTTP response for a 503 response error.	180
mxe.webclient.activitydashboard	A Boolean value that enables or disables activity dashboard monitoring. You might need to add this property before you enable it.	FALSE
mxe.webclient.allowURLDefinedUISessionID	Allows a launching URL to define the session ID for the UI state object that is created.	0
mxe.webclient.async	Indicates whether asynchronous data validation is enabled for the system. Asynchronous (or background) data validation is the default behavior but you can disable it if required.	1
mxe.webclient.asyncerrortooltipwaitbeforeopen	The number of seconds before an error tooltip displays when a user drags the mouse over an error icon.	2
mxe.webclient.asyncrendertimelimit	Specifies the maximum number of seconds between the responses that are sent to the user interface when processing multiple asynchronous validation requests.	15
mxe.webclient.asyncrequestsbeforerender	Specifies the maximum number of concurrent asynchronous validation requests that the user interface framework processes before rendering a response.	5
mxe.webclient.attachimage	Enables or disables the Attach Clipboard Image button when you create communications.	0
mxe.webclient.checkCSRFONLogout	If CSRF checks are enabled, checks the CSRF security token during the logout process.	0
mxe.webclient.ClientDataValidation	Enables client side browser data validation. The mxe.webclient.async property must also be set for this property to work.	1
mxe.webclient.ClientEventQueue.threshold	The maximum number of events in the client event queue before the queue is sent to the server.	2
mxe.webclient.ClientEventQueue.timeout	The maximum time in milliseconds the client event queue waits before the queue is sent to the server.	10000
mxe.webclient.depRequiredCheck	When this property is enabled, before saving data, a check is completed to verify that valid data was provided for all fields that require a value.	1
mxe.webclient.disablelongopquery	Indicates whether a <b>longop</b> query is disabled.	0
mxe.webclient.exitcontexttimeout	Context timeout on exiting.	0
mxe.webclient.goToButtonHeaders	Hides the Go To button when disabled. If this property is enabled and the home button property is disabled, the Go To button appears with the other buttons on the header and is less apparent.	1
mxe.webclient.homeButtonHeaders	Makes the Start Center and Go To buttons more apparent in the UI and separates them from the other header buttons. Disabling this property adds the buttons to the other header buttons and makes them less apparent. Disabling this property also moves the Go To button, even if the Go To button property is enabled.	1
mxe.webclient.isUpgrade	Indicates that an upgrade has occurred.	0
mxe.webclient.listtable.retainstate	When enabled, this property retains the state of the List tab for the user session. If disabled, when the user returns to the List tab after working in other tabs, the List tab is reset and any filters set are lost.	1

Property name	Description	Default value
mx.webclient.logging.CorrelationEnabled	A Boolean value to enable or disable the Correlation ID for tracking.	FALSE
mx.webclient.lostconnectionrecheckinterval	Specifies the interval in seconds to wait before rechecking the server to see if the connection is restored after a loss of connection.	2
mx.webclient.lostconnectionwarninginterval	Specifies the interval in seconds to wait before checking if the connection to server is lost.	15
mx.webclient.lostconnectionwarningonly	A Boolean value that enables or disables display of a server connection lost only warning.	FALSE
mx.webclient.maxNavbarQueryLimit	Sets the limit of query items that are displayed in the navigation bar.	20
mx.webclient.maxsessions	Specifies the maximum number of concurrent sessions configured for the server.	0
mx.webclient.maxsessionsend503	If enabled, the server sends a 503 error when the server reaches the maximum number of concurrent sessions, or when the user reaches the maximum number of UI sessions for an HTTP session.	1
mx.webclient.maxUISessionsPerHttpSession	Redirects you to the login error page when the user reaches the maximum number of UI sessions for an HTTP session. A setting below 1 is unlimited.	10
mx.webclient.timeoutOfOrderReqTimeOut	The number of seconds a client request waits for earlier sequenced requests to reach the server.	20
mx.webclient.simplifiedomaindownload	Allows you to automatically download simple domains.	1
mx.webclient.skin	Specifies the style that is used in the user interface.	MAS8
mx.webclient.tabBreadcrumbs	Enables subtabs to be suppressed when the List tab is visible and replaces the List tab with a button when deep in a record.	1
mx.webclient.searchMenubar	Hides the app menu bar when set to 0. The app menu bar is the menu above the List table and includes the Advanced Search button and the Save Query button.	0
mx.webclient.verticalLabels	Specifies the position of labels.  When set to 0, labels appear beside the corresponding field. When set to 1, labels appear above the corresponding field.  When set to 2, labels dynamically adjust to the left of the field or above the field as the interface increases or decreases in size.	2
mx.webclient.warningHandling	Enables applications to perform a check for all required fields that need a value when saving.	0
webclient.ResultSetQueryTimeout	Specifies the number of seconds that elapse before a query timeout occurs when it is initiated from a ResultsBean.	360
webclient.accessibilitymode	A Boolean value that enables or disables UI accessibility mode.	FALSE
webclient.addhyphen tobreak	If enabled, adds a hyphen to break words.	FALSE
webclient.allowin subframe	Allows the Maximo® system to load within a frame (disable frame busting).	FALSE
webclient.canbreak words	If enabled, breaks words for text rendering.	TRUE
webclient.change pwdapp	Change password application.	changepasswd
webclient.debug.console.group	Provides access to the debug console for the specified security group.	Null
webclient.debug.console.users	Provides access to the debug console for the specified users.	Null
webclient.debug.pgrade	Enable additional logging for debugging the screen upgrade process.	FALSE
webclient.default button	Disables default buttons globally for tables.	1
webclient.designer.group	Specifies the default security group that can add generic signature options and application authorizations for new applications in the Application Designer.	MAXADMIN
webclient.dojo.debug	A Boolean value that enables or disables debugging for the Dojo framework.	0
webclient.download.datetimestext	Sends data from a table download from Microsoft Excel in text or date and time format.	0
webclient.download.durationastext	Allows you to download the duration type as text in Microsoft Excel.	1

Property name	Description	Default value
webclient.downloadpreservewhitespace	Preserves text white space from Excel download.	1
webclient.emptylistonclear	If enabled, an empty table displays when a filter is cleared, or a Clear button is used.	TRUE
webclient.enabledoclinkonload	If enabled, the style of an attachments control can change to indicate whether there is a document attached.	FALSE
webclient.exitcontexttimeout	This property specifies the delay in seconds before closing a session after the user exits.	60
webclient.exitwarning	A Boolean value that enables or disables a warning whenever a user exits.	1
webclient.gcfilepath	The filepath for garbage collection.	C:\\bea\\user_projects\\mydomain\\
webclient.hideUnauthorizedFavoriteApps	Prevents a favorite application from showing if a user loses access to it.	1
webclient.leavecontexttimeout	The time that elapses after a user leaves a context, before the context times out.	60
webclient.listwarningthreshold	A Boolean value that enables or disables the display of a warning when the number of records to list exceeds the maximum number of records that can be shown on the page.	1
webclient.loginerrorpage	Specifies the location of the login error JSP page.	../webclient/login/loginerror.jsp
webclient.loginpage	Specifies the location of the login JSP page.	../webclient/login/login.jsp
webclient.logoutpage	Specifies the location of the log out JSP page.	../webclient/login/logout.jsp
webclient.longquerydialogwaitetime	If a longop query does not complete within the time specified (in ms), a dialog box opens.	3000
webclient.mask	Specifies the characters to show when a field is masked.	XXXXXX
webclient.maxdownloadrows	Specifies the maximum number of records to download in a table. Setting this value to -1 (minus one) downloads all rows of data.	-1
webclient.maxRecentApps	Specifies the number of applications that appear in the My Recent Applications list. Set to 0 to disable the list.	8
webclient.maxselectrows	Specifies the maximum number of rows that a user can select from a results (or list) table.	200
webclient.multiplebrowsersupport	Indicates whether a user can open applications in multiple tabs in a browser or in multiple browser windows.	TRUE
webclient.multiplesorttables	Indicates whether a user can sort multiple columns.	FALSE
webclient.needs save	A list of events that require save access.	addrow,toggleddeleterow
webclient.no_xmlcache	Resets the browser cache.	FALSE
webclient.performancestatistics	Generates user interface performance statistics.	disabled
webclient.refreshKpiPortlet	Controls whether the KPI Portlets refresh on login.	1
webclient.richtext.blocknode	Sets the rich text editor block node for the enter key: BR, DIV, or P.	DIV
webclient.richtext.fontlist	The rich text editor uses default web fonts, such as serif, monospace, and sans-serif. Add a comma-separated list of custom fonts, if required.	null
webclient.savestartcenter templates	If enabled, the labels in the Start Center are stored in the database for translation. If disabled, labels are not saved for translation.	TRUE
webclient.selectrow.async	If enabled, clicking on a check box will not change the row that is in focus. The user must click elsewhere on the row to move the focus to that row.	1
webclient.sessiontimeoutwarningtime	Specify the number of minutes that can elapse before a session timeout warning is shown.	2
webclient.smartfilter	If enabled, a user can enter partial data in a field and, if an exact match is found in the database, the field updates with this value. If multiple possible matches are found, the user can select from a list of possible matches to update the field.	ON
webclient.startapp	Specifies the application that loads on startup (if not using a start application).	startcntr
webclient.startpage	Specifies the page that loads on startup (if not using a start page).	
webclient.synchronousQueryFields	Forces synchronous validation on some fields. Must be kept in sync with the multitancy async property.	0

Property name	Description	Default value
webclient.systemeventhandler	Specifies the system event handler.	psdi.webclient.system.controller.SystemEventHandler
webclient.useabbrevrenderid	If enabled, shorter renderIds are used.	TRUE
webclient.useabsoluteimagepath	If enabled, applications must use an absolute path for images.	FALSE
webclient.useClientTimer	Adjusts the Current* Time according to how long the page is opened and not when the page was rendered.	1
webclient.webseal.eaiheader	The header name that is used to communicate External Authentication Information to the system.	am-eai-server-task
webclient.webseal.sessionidheader	The header name that is used to send the session id from webseal to the system.	user_session_id
webclient.webseal.terminatesession	Enables the termination of the webseal during a session timeout.	0
webclient.wfmapimageformat	Specifies the format of the WorkFlow Map image, which must be in .png or .gif format.	png
webclient.wraplength	Length to wrap	75
webclient.wrapreadonlycolumns	Wrap UI Columns	TRUE

## Utilities for logging and testing

To help you manage system performance, there are utilities that you can use for testing and debugging purposes. When you are satisfied with your deployment, you can disable these logging utilities.

## Utilities that track system performance

By default, the mbocount logging utility, the logSQLTimeLimit logging utility, and the fetchResultLogLimit logging utility are enabled in the properties file. By using these utilities, you can track the following possible system performance issues while you configure an initial system deployment:

- Excessive use of business objects
- Slow execution of SQL statements
- High number of records that are returned in a query result

To disable the logging utilities, change the debugging properties that are described in the table.

Table 1. Debugging properties

Property	Description	Default value
mail.debug	Used to troubleshoot email connectivity, configuration, and formatting problems. The property is a JavaMail API debug property.  To enable, change the value to true.	false
mxe.mbocount	Displays the number of business objects that the server created.  To disable, change the value of the property to 0.	1
mxe.db.logSQLTimeLimit	Represents the SQL statements that take longer than the specified time limit are logged. The time is measured in milliseconds.  To disable, change the value of the property to 0.	1000
mxe.db.fetchResultLogLimit	When this property is enabled, a stack trace is printed in the log for every business object set that fetches beyond the set limit of rows. The stack trace log is also repeated for every multiple of such fetches.  To disable, change the value of the property to 0.	1000 rows
mxe.db.logSQLPlan (Oracle only)	Setting this property to true logs the execution plan for all SQL statements that contain a full table scan.  If you define mxe.db.sqlTableScanExclude, all tables, except for the ones you intentionally exclude, are logged.  If you do not define mxe.db.sqlTableScanExclude, only the SQL statements that exceed the time limit that is set in mxe.dblogSQLTimeLimit are logged.	0

Property	Description	Default value
mxe.db.sqlTableScanExclude=ACTION,MAXROLE,SCCONFIG,MAXUSER (Oracle only)	You can define the table names that you want to exclude from the log. The table names must be uppercase.  If you define mxe.db.sqlTableScanExclude, all tables, except for the ones that you list, are logged.  If you do not define mxe.db.sqlTableScanExclude and you set mxe.db.logSQLPlan=true, only the SQL statements that exceed the time limit that is set in mxe.dblogSQLTimeLimit are logged.	0
mxe.logging.CorrelationEnabled	Represents the correlation ID that is logged if a percentage of the queue is specified in the logger layout.	1
mxe.logging.disableLoggingPropFile	Disables the logging.properties file for logging.	0
mxe.logging.rootfolder	Represents the default root folder to where Maximo® generated log files are written.	

## Work order properties

You can use system properties to help manage work orders.

Table 1. Work order properties

Property	Description	Default value
mxe.msgLogFile	Represents the log file for work order generation.	
mxe.workorder.rollupMaintenanceCosts	Specifies whether to automatically roll up maintenance costs for assets that are associated with a work order when the work order is closed.	0

## Workflow properties

You can use workflow properties to specify the email account of the administrator, control status inheritance for work items, and define the maximum number of loops that can occur between condition nodes.

Table 1. Workflow properties

Property	Description	Default value
mxe.workflow.admin	Represents the email address of the workflow administrator. The workflow is not impeded if you leave this value blank, but error messages that have communication templates associated with them might not be sent. Successful delivery of free-form notifications depends on the value set for this property.	N/A
mxe.app.workflowControlStatusInheritance	Allows status inheritance for work items that are under process flow control.  You set this property to true (1) to ensure that the status is inherited from the parent work order to the child work order. The Flow Start and Flow Complete statuses are not inherited; they are INPRG and COMP, by default.	0
mxe.workflow.infiniteLoop	Defines the maximum number of loops that can occur between two condition nodes in a workflow process. This system property ensures that the workflow process cannot enter an infinite loop. 5000 is the both the default value and the minimum value. If you set a value lower than 5000, it will be ignored, and the workflow process will stop once it reaches 5000 loops.	5000

## Maximo Manage facts

- The custom resource for the Maximo® Manage workspace provides properties for activating the application. For information about the custom resource, see [Properties for workspace deployment](#).
- One default IBM® Maximo Application Suite skin is available in Maximo Manage.
- The following items are not displayed in Maximo Manage:
  - `mxe.webclient.skin`. It is set to a Maximo Application Suite skin.
  - `mxe.webclient.dynamicFontSize.iot18`. It is set to 0, "false".
  - `mxe.webclient.verticalLabels`. It is set to 1, "vertical".
  - "Side navigation menu" option is user's "Default information" dialog. It is set to "Display".
- If the electronic signature feature is used, some changes are made due to the new authentication protocol. Refer to product documentation for the updated electronic signature functions.

## Glossary

This glossary includes terms and definitions for Maximo Manage.

The following cross-references are used in this glossary:

- See refers you from a term to a preferred synonym, or from an acronym or abbreviation to the defined full form.
- See also refers you to a related or contrasting term.

## A

---

- access collection
  - A group of objects that have data-level access control and to which users are granted role-based access.
- action
  - A defined task that an application performs on an object as a result of an event.
- actuals
  - The commodity (physical or service) that underlies a future or forward contract.
- alias
  - An alternative name used instead of a primary name.
- appender
  - A component that receives logging requests from a logger and writes log statements to a specified file or console. See also [logger](#).
- application
  - One or more computer programs or software components that provide a function in direct support of a specific business process or processes. See also [application server](#).
- application programming interface (API)
  - An interface that allows an application program that is written in a high-level language to use specific data or functions of the operating system or another program.
- application server
  - A server program in a distributed network that provides the execution environment for an application program. See also [application](#).
- application server authentication
  - User authentication that verifies a user's credentials based on an external authentication mechanism such as LDAP.
- archive
  - To copy programs, data, or files to another storage media, usually for long-term storage or security.
- argument
  - An independent variable or any value of an independent variable. Examples of arguments are a search key and a number identifying the location of an item in a table.
- asset
  - A manageable object that is either deployed or intended to be deployed in an operational environment. See also [configuration item](#).
- asset template
  - A record that specifies asset information that is shared by multiple asset records. An asset template can be applied to existing asset records or it can be used to generate multiple new asset records for similar assets, such as a fleet of vehicles.
- assignment
  - A labor requirement on a work order record that has been matched to an appropriate laborer.
- authentication
  - In computer security, verification of the identity of a user or process and the construction of a data structure that contains the privileges that were granted to the user or process.
- authority
  - The right to access objects, resources, or functions.
- authorization
  - In computer security, the right granted to a user to communicate with or make use of a computer system.
- autokey seed
  - The first number in an automatic numbering sequence for a keyfield. If an autonumbering sequence exists, the autokey seed is the next key value that is used for a new record.

## B

---

- bandwidth
  - The capacity of a communication line, normally expressed in bits per second (bps).
- base currency
  - The currency that is used to calculate costs for an organization.
- BIRT
  - See [Business Intelligence and Reporting Tools](#).
- blanket agreement
  - A purchase contract that specifies a vendor, a total dollar amount to be spent, and the dates between which the agreement is valid.
- blanket contract
  - A contractual agreement to spend a predetermined amount of money with a specified vendor over a predefined period of time.
- Business Intelligence and Reporting Tools (BIRT)
  - An Eclipse-based open source reporting system for web applications.
- business object
  - A software entity that represents a business entity, such as an invoice. A business object includes persistent and nonpersistent attributes, actions that can be performed on the business object, and rules that the business object is governed by.
- business process
  - A defined set of business activities that represent the required steps to achieve a business objective. A business process includes the flow and use of information and resources.

## C

---

- cache
  - A buffer that contains frequently accessed instructions and data; it is used to reduce access time.
- change order
  - An update to a purchase order that is already approved or printed and that changes information such as quantity or vendor.
- CI
  - See [configuration item](#).

claim

A request for reimbursement, replacement, or repair for an item or an asset that is under warranty.

clearance

The control and positioning of plant equipment for providing protection for personnel and equipment during work on plant devices.

clone

A copy of an application, created so that it can be customized while the original is retained.

CM item

See [configuration-managed item](#).

column

The vertical component of a database table. A column has a name and a particular data type (for example, character, decimal, or integer).

comparison rule

A component of a reconciliation task that is used to compare attributes of linked objects from two data sets. See also [link rule](#), [reconciliation task](#), [task filter](#).

compliance

A state of being in accordance with established software and security specifications on target computers, or the process of becoming so.

condition-enabled item

An item that has a value or worth that is assigned and tracked based on its physical condition.

configuration item (CI)

Any component of an information technology infrastructure that is under the control of configuration management. See also [asset](#).

configuration-managed item (CM item)

A specialized item type that represents a part number that is under configuration management control as part of the reference engineering data.

configuration management

The process of planning for, identifying, controlling, and verifying the configuration items within a service, recording and reporting their status and, in support of change management, assessing the potential impact of changing those items.

consignment

A classification type for inventory materials that are stored on-site but that are owned by an external vendor. The vendor retains ownership of the consignment items until they are used and paid for by the organization that is storing them.

cost center

An organizational element that contributes to the cost of a project.

craft

A work activity performed by a labor, for example, "plumbing."

cron task

A task that is set to run automatically at an appointed time.

crossover domain

A domain that returns a value from a field in one application to a field in another application.

crossover field

An application field that links to other fields, allowing a user to link data between certain applications.

## D

---

data type

An attribute that is used for defining data as either numeric or character or both.

Data Universal Numbering System (DUNS)

A system in which internationally recognized nine-digit numbers are assigned and maintained by Dun & Bradstreet to uniquely identify worldwide businesses.

dead date

The date past the due date plus the grace period, at which point the component becomes inoperable.

deployed asset

A manageable object that exists in an IT environment, such that its presence can be verified (for example, by using a discovery tool).

device

A piece of equipment such as a workstation, printer, disk drive, tape unit, or remote system.

direct issue item

An ordered item that is issued immediately upon receipt to a work order, equipment, or location rather than stocked in the storeroom.

directory

In a hierarchical file system, a grouping of related files.

discovery tool

A program that scans computers and other devices connected to a network and records information about their installed hardware and software.

DNS

See [domain name server](#).

domain

A list of defined values from which users choose an appropriate value.

domain name server (DNS)

A server program that supplies name-to-address conversion by mapping domain names to IP addresses.

downtime

The time during which a functional unit cannot be used because of a fault within the functional unit or within the environment.

DUNS

See [Data Universal Numbering System](#).

dynamic segmentation

The ability to analyze a linear asset multiple ways without affecting its underlying geometry.

## E

---

EAM

See [enterprise asset management](#).

EAR

See [enterprise archive](#).

EAR file

See [enterprise archive](#).

economic order quantity (EOQ)

The optimum reorder quantity of an item, in the specified units of order, to be used as the default or standard reorder amount. The economic order quantity is a calculation of the optimum reorder amount that balances the costs of keeping inventory in stock and the costs of reordering inventory items.

electronic signature (ESIG)

A stamp that is added to mail messages, fields, or sections that verifies that the person who originated the message is the author and that no one has tampered with the data.

email listener

An application that receives and processes incoming email messages.

enterprise archive (EAR)

A specialized type of JAR file, defined by the Java™ EE standard, used to deploy Java EE applications to Java EE application servers. An EAR file contains EJB components, a deployment descriptor, and web archive (WAR) files for individual web applications.

enterprise asset management (EAM)

The process of managing an organization's assets throughout their life cycle, from requisition to retirement.

enterprise service

A service that typically accesses one or more enterprise information systems.

EOQ

See [economic order quantity](#).

escalation

A course of action that runs when a task is not completed satisfactorily within a specific period of time.

escalation point

A condition or threshold that must be met in order to trigger an escalation.

ESIG

See [electronic signature](#).

exception

A condition or event that cannot be handled by a normal process.

export

To move information from one system or program to another.

expression

In programming languages, a combination of terms and operators that can be evaluated to a single value by using the rules of precedence for the given language.

external PO

See [external purchase order](#).

external purchase order (external PO)

A purchase order or request to an outside vendor. See also [internal purchase order](#).

## F

---

failover

An automatic operation that switches to a redundant or standby system in the event of a software, hardware, or network interruption.

failure class

The highest level of a failure hierarchy.

failure hierarchy

A tree structure that shows relationships between identified problems, causes, and remedies for asset and operating location failures. Failure hierarchies are built from the top level, the failure class, down.

feature

A physical object, such as a guardrail or mile marker, that is associated with one or more linear assets, but which does not have a unique ID.

FIFO

See [first-in first-out](#).

firmware

Proprietary code that is usually delivered as microcode as part of an operating system.

first-in first-out (FIFO)

A queuing technique in which the next item to be retrieved is the item that has been in the queue for the longest time. See also [last-in first-out](#).

first-in first-out costing

A method of cost accounting that can be used to make an inventory valuation, based on actual receipt costs. First-in first-out costing uses the "first in" (oldest) item cost for inventory transactions. See also [last-in first-out costing](#).

FOB point

See [free on board point](#).

foreign key

In a relational database, a key in one table that references the primary key in another table. See also [primary key](#).

free on board point (FOB point)

The point where responsibility and liability for a shipped item are transferred. The FOB point is usually either the destination or the shipping point.

## G

---

general ledger account (GL account)

An account that is used to track expenses for various entities within a company, such as assets, locations, or tools.

geographic information system (GIS)

A complex of objects, data, and applications that is used to create and analyze spatial information about geographic features.

GIS

See [geographic information system](#).

GL account

See [general ledger account](#).

## H

---

handler

A software routine that controls a program's reaction to specific external events, such as an interrupt handler.

hard reservation

A firm request for items from a storeroom that is defined by the need for the items within a specific time frame. A hard reservation reduces the available balance of items. Hard reservations are prioritized and cannot be superseded by other reservation types. See also [soft reservation](#).

high availability

The ability of IT services to withstand all outages and continue providing processing capability according to some predefined service level. Covered outages include both planned events, such as maintenance and backups, and unplanned events, such as software failures, hardware failures, power failures, and disasters.

hot standby

A redundant server that, if the primary server or hub server fails, assumes the responsibilities of the failed server.

## I

---

IAS

See [item assembly structure](#).

import

To bring information from one system or program into another.

incident

An event that is not part of the standard operation of a service and causes or can cause a disruption to or a reduction in the quality of services and customer productivity.

index

A set of pointers that is logically ordered by the values of a key. Indexes provide quick access to data and can enforce uniqueness of the key values for the rows in the table.

internal PO

See [internal purchase order](#).

internal purchase order (internal PO)

A purchase order or request to an internal vendor, such as a storeroom. See also [external purchase order](#).

inventory usage record

A record that contains information about the usage of inventory items, such as by issuing, transferring, or returning items to storeroom locations. An inventory usage record contains details such as quantity, storeroom location, and information about related records, such as assets and work orders.

invoice

The bill for services or products provided to a customer. The invoice includes all agreed to charges associated with the services or products provided.

issue

To release an item from a storeroom location and charge the cost to an asset, GL account, location, work order, location, or GL account.

issue unit

The quantity of an item that is considered a single item; for example, gloves are issued in pairs. The issue unit might be different from the order unit. See also [order unit](#).

item

Inventory that might be part of an asset, but which is not strictly monitored, and whose cost is less than an asset.

item assembly structure (IAS)

A list of individual items and subassemblies that are required to build a piece of equipment or define the requirements of an operating location.

item kit

A group of items that are issued as one single unit.

item record

A document that defines an item or material that is stocked in a storeroom. Item records are also used for purchasing.

## J

---

Java Database Connectivity (JDBC)

An industry standard for database-independent connectivity between the Java platform and a wide range of databases. The JDBC interface provides a call level interface for SQL-based and XQuery-based database access.

JDBC

See [Java Database Connectivity](#).

JIT

See [just-in-time](#).

job plan

A detailed description of work to be performed for a work order. A job plan typically includes required tasks and lists of estimated labor, materials, services, and tools needed to complete the work.

join

An SQL relational operation in which data can be retrieved from two tables, typically based on a join condition specifying join columns.

just-in-time (JIT)

A production and inventory system in which parts are produced or delivered only as needed.

## K

---

key performance indicator (KPI)

A measurable quantity against which specific performance criteria can be set when a service level agreement is written.

KPI

See [key performance indicator](#).

## L

labor	A person who carries out a specific job (a labor performs a craft).
laborer	A human resource within a crew.
labor record	A document that contains information about a worker, such as craft, skill level, hours worked, and certifications. A labor record cannot exist without a corresponding person record. See also <a href="#">person record</a> .
last-in first-out (LIFO)	A queuing technique in which the next item to be retrieved is the item most recently placed on the queue. See also <a href="#">first-in first-out</a> .
last-in first-out costing	A method of cost accounting that can be used to make an inventory valuation, based on actual receipt costs. Last-in first-out costing uses the "last in" (newest) item cost for inventory transactions. See also <a href="#">first-in first-out costing</a> .
launch-in-context	An operation in which a user starts a secondary application from a primary application to perform a specific task. Using the parameters, navigation instructions, and user credentials that are supplied by the primary application, the secondary application opens to the specific place in which to complete the task.
lead time	The amount of time between placing an order and receiving the items.
license allocation	Resources such as assets, partitions, users, and locations that a license is assigned to. See also <a href="#">license scope</a> .
license scope	The breadth of a license in terms of enterprise, site, machine, or partition. If discovered software is found within the scope of a license, then that license might be used for that discovered instance. See also <a href="#">license allocation</a> .
LIFO	See <a href="#">last-in first-out</a> .
linear asset	An asset that is maintained in segments, such as a road, pipeline, or railroad track. Measurements are made along the linear asset to specify work, monitoring, metering, or placement of signs. See also <a href="#">point asset</a> .
linear referencing	Defining the location of a point along a linear asset.
linear referencing method (LRM)	A method of determining a position on a linear asset by using a known start point, a measure, a direction, and offset values.
linear segment	The span of a linear asset that is defined by a start and an end measure. The span can be the entire length of the linear asset or any continuous part of it.
line item	<ol style="list-style-type: none"><li>1. An item, material, service, or tool that is named on a contract, purchase requisition, purchase order, or invoice.</li><li>2. A queued task or service that is pending completion.</li></ol>
link rule	A required component of a reconciliation task that is used to link instances from two data sets based on one or more common attributes. See also <a href="#">comparison rule</a> , <a href="#">reconciliation task</a> , <a href="#">task filter</a> .
listener	A program that detects incoming requests and starts the associated channel.
LMO	See <a href="#">logical management operation</a> .
load balancing	The monitoring of application servers and management of the workload on servers. If one server exceeds its workload, requests are forwarded to another server with more capacity.
loaded cost	The total cost of the item, including taxes and service costs.
locale	A setting that identifies language or geography and determines formatting conventions such as collation, case conversion, character classification, the language of messages, date and time representation, and numeric representation.
location	A place where assets are operated, stored, or repaired.
logger	A component that prepares log statements to be written to console or log file. See also <a href="#">appender</a> .
logical management operation (LMO)	A generic function that is supported by a set of devices. For example, configuring an IP address on a network interface is a logical management operation supported by all operating systems. Although this is logically the same function, the steps for performing this function on each operating system are different. These steps are supported by provisioning workflows for that operating system.
LRM	See <a href="#">linear referencing method</a> .

## M

manifest	An XML file that describes the content of an entire migration package and that facilitates the deployment of the package in a target Maximo environment.
measurement point	A record that defines the acceptable upper and lower conditions and performance limits for a point or place on a piece of equipment.
meter	A record that is used to record measurements.

## N

---

### namespace

In XML and XQuery, a uniform resource identifier (URI) that provides a unique name to associate with the element, attribute, and type definitions in an XML schema or with the names of elements, attributes, types, functions, and errors in XQuery expressions.

### non-operational downtime

Downtime that occurs when an asset is not normally in use.

### nonpersistent column

A temporary data field that an object uses for calculations or temporary storage. See also [persistent column](#).

## O

---

### offset

The number of measuring units from an arbitrary starting point to some other point.

### operating location

A location type that indicates the presence of operating assets (as opposed to a storage or repair facility).

### operational downtime

Downtime that occurs during a period in which equipment is normally in use, and that causes a work cell or production line to stop so that operational time is lost.

### operational management product

A product in the IT environment that supplies information about configuration items to the discovery process.

### operator

A symbol (such as +, -, or \*) that represents an operation (in this case, addition, subtraction, multiplication).

### order unit

The standard unit by which an item is ordered that can differ from the issue unit. See also [issue unit](#).

### organization

A record that identifies a unique legal entity. The data set for an organization includes information that companies or other distinct legal entities might share, such as calendars, vendors, and financial information. An organization can contain one or more sites. See also [site](#).

### overrun

A situation where a planned event takes longer to complete than was planned. For example, an overrun occurs when a rail locomotive was planned to be in the maintenance yard for 5 days but it actually takes 6 days.

## P

---

### parameter (parm)

A value or reference passed to a function, command, or program that serves as input or controls actions. The value is supplied by a user or by another program or process.

### parm

See [parameter](#).

### persistent column

A data field that an object uses to write data to a database table after processing. See also [nonpersistent column](#).

### personalization

The process of enabling information to be targeted to specific users based on business rules and user profile information.

### person record

A document that contains personal information about a worker and other general information such as workflow and purchasing information. See also [labor record](#).

### planned downtime

Time when equipment is scheduled to be down and available for maintenance work. The calendar of an asset is used to calculate downtime.

### PM

See [preventive maintenance record](#).

### PM alert

A message that indicates that a preventive maintenance work order is about to become due for an asset or location. See also [preventive maintenance record](#).

### PO

See [purchase order](#).

### point asset

An asset whose length or measure is not integral to its maintenance, such as an airplane or a train car. See also [linear asset](#).

### portlet

A reusable component that is part of a web application that provides specific information or services to be presented in the context of a portal.

### PR

See [purchase requisition](#).

### preventive maintenance record (PM)

A template for scheduled preventive maintenance work. PMs can contain job plan and corresponding safety plan information that the system copies to work orders. See also [PM alert](#).

### primary key

In a relational database, a key that uniquely identifies one row of a database table. See also [foreign key](#).

### problem

Unknown underlying cause of one or more incidents.

### proxy server

A server that receives requests intended for another server and that acts on behalf of the client (as the client's proxy) to obtain the requested service. A proxy server is often used when the client and the server are incompatible for direct connection. For example, the client is unable to meet the security authentication requirements of the server but should be permitted some services.

### purchase order (PO)

An authorized order to an external vendor or internal supplier.

### purchase requisition (PR)

A written request that is issued internally to the purchasing department to purchase items, materials, or services.

## Q

---

QBE

See [query by example](#).

query

A request for information from a database that is based on specific conditions: for example, a request for a list of all customers in a customer table whose balances are greater than USD1000.

query by example (QBE)

A query that is specified by entering sample data in the appropriate fields.

## R

---

RDB

See [relational database](#).

read-only

Pertaining to data that can be read but cannot be modified.

reconciliation

A transaction that compares discovered assets to authorized assets.

reconciliation task

A scheduled task that uses a collection of rules and filters to link and compare data from two data sets. See also [comparison rule](#), [link rule](#), [task filter](#).

redundancy

The use of several identical functional units, such as several disk drives or power supply systems, within one computer system in order to provide data security and a certain degree of fault tolerance in case of hardware failures.

reference point

A feature instance that can be used as a start or end point for a linear segment.

reference point offset

A distance along the length of the asset measured from a previously defined reference point. For example, a speed sign is .2 miles from milepost 10.

relational database (RDB)

A database that can be perceived as a set of tables and manipulated in accordance with the relational model of data. Each database includes a set of system catalog tables that describe the logical and physical structure of the data, a configuration file containing the parameter values allocated for the database, and a recovery log with ongoing transactions and archivable transactions.

relational operator

An operator that compares two operands and yields a Boolean value.

release PO

See [release purchase order](#).

release purchase order (release PO)

A purchase order for a portion of the total amount or lines specified on an associated volume contract.

reorder point (ROP)

The point at which an inventory item should be reordered so that its in-stock balance does not fall below the level designated as safety stock during the lead time for the order.

requisition

A request for an asset, item, tool, or service. The requested entity can be procured from a vendor, or it can be acquired by an inter-departmental transfer.

reserved item

An item is placed on hold in a storeroom for a given work order, GL account, asset, or location.

ROP

See [reorder point](#).

rotating asset

A non-perishable asset that is tracked in inventory through its association with a specific rotating item.

rotating item

An inventory item for which each instance of the item is also tracked by its own asset number. Rotating items are typically repaired or refurbished, not discarded.

rotating tool

A tool for which each instance of the tool is also tracked by its own asset number.

## S

---

safety stock

The minimum inventory level of an item that should always be available at the associated storeroom location.

schema

A collection of database objects such as tables, views, indexes, or triggers that define a database. A schema provides a logical classification of database objects.

script

A series of commands, combined in a file, that carry out a particular function when the file is run. Scripts are interpreted as they are run.

SDK

See [software development kit](#).

segment

A defined section of a linear asset.

serialized asset

See [rotating asset](#).

serialized item

See [rotating item](#).

server

A software program or a computer that provides services to other software programs or other computers.

service level agreement (SLA)  
A contract between a customer and a service provider that specifies the expectations for the level of service with respect to availability, performance, and other measurable objectives.

service request  
A request from a user for help, information, advice, or access to an IT service.

shared disk  
A disk that is configured to serve more than one node. Shared disks are physically connected to multiple nodes.

shipment receipt record  
A record that contains information about the receipt of materials at a location, for example, at a site or storeroom within an organization. A shipment receipt record contains details such as the quantity of items that are received, the date of receipt, and the locations of the source and destination storerooms.

shipment record  
A record that contains information about the transfer of materials between source and destination storerooms, such as between two sites within an organization. A shipment record contains details such as the delivery method, the quantity of items, the date of the shipment, and the storeroom locations.

site  
A work location, such as a plant or facility. See also [organization](#).

SLA  
See [service level agreement](#).

slot  
A sub-location within a maintenance location. For example, a railway depot or an aircraft hangar may be sub-divided into slots so that maintenance tasks can be allocated.

soft reservation  
A request for items or tools that is not yet defined by the need for the items within a specific time frame. A soft reservation does not reduce the available balance. When a reservation is classified as soft, the item is available for eventual issue from the list of reservations. See also [hard reservation](#).

software development kit (SDK)  
A set of tools, APIs, and documentation to assist with the development of software in a specific computer language or for a particular operating environment.

software item  
Any version of any software product or component.

SQL  
See [Structured Query Language](#).

standby node  
A device that assumes the identity of a primary node if the primary node fails or is taken out of service. The standby node runs the primary node's workload until the primary node is back in service.

stocked tool  
A tool that is available in a storeroom.

storeroom  
A physical location where items are stored.

Structured Query Language (SQL)  
A standardized language for defining and manipulating data in a relational database.

subassembly  
An assembled unit that is incorporated with other units into a complete assembly. A subassembly is a child asset.

suspense account  
An account that is used to store short-term funds or securities until a decision is made about their allocation.

## T

---

table  
In a relational database, a database object that consists of a specific number of columns and is used to store an unordered set of rows.

table window  
A section of an application page or dialog box that displays multiple records from a database table simultaneously.

tag  
A physical label that is applied to an asset to indicate the device, its position, and the controlling authority.

tag out procedure  
The procedure for taking work assets out of service or placing them back in service to ensure a safe work environment.

task filter  
A component of a reconciliation task that specifies a subset of objects to evaluate when a reconciliation task is executed. See also [comparison rule](#), [link rule](#), [reconciliation task](#).

technical record  
A record that maintains information that is related to an externally published directive or bulletin, such as an airworthiness directive or a customer service notification. Technical records are used in highly regulated industries to ensure that all regulations are properly implemented.

ticket  
A record, such as a service request, incident, or problem report, that can be routed and assigned a status.

time stamp  
The value of an object that indicates the system time at some critical point in the object's history.

## V

---

vendor  
A person or company that supplies materials or services to another person or company.

volume contract  
See [blanket contract](#).

## W

---

WO

See [work order](#).

workflow

The structured sequence of activities and tasks that are used to implement a specific change, release, or other process, including automatic routing and tracking of records for approval and other tasks.

work order (WO)

A record that contains information about work that must be performed.

work plan

A list of the operations, labor, materials, and tools that are required to complete a work order.

---

## Y

Y-offset

A distance perpendicular to the direction of the linear asset. For example, a speed limit sign is located 10 feet from the right edge of the road. "Right" is positive and "left" is negative. Therefore, the Y-offset is 10.

yorn

A field in which a user can enter Y (for "yes") or N (for "no").

---

## Z

Z-offset

A distance above or below a linear asset. For example, an exit sign is located 18 feet above the surface of the road, and a culvert is 4 feet below the surface of the road. The Z-offset for the sign is 18, and the Z-offset for the culvert is -4.

---

IBM may use or distribute any of the information you provide in any way it believes appropriate without incurring any obligation to you.

Licensees of this program who wish to have information about it for the purpose of enabling: (i) the exchange of information between independently created programs and other programs (including this one) and (ii) the mutual use of the information which has been exchanged, should contact:

*IBM Director of Licensing  
IBM Corporation  
North Castle Drive, MD-NC119  
Armonk, NY 10504-1785  
US*

Such information may be available, subject to appropriate terms and conditions, including in some cases, payment of a fee.

The licensed program described in this document and all licensed material available for it are provided by IBM under terms of the IBM Customer Agreement, IBM International Program License Agreement or any equivalent agreement between us.

The performance data and client examples cited are presented for illustrative purposes only. Actual performance results may vary depending on specific configurations and operating conditions.

Information concerning non-IBM products was obtained from the suppliers of those products, their published announcements or other publicly available sources. IBM has not tested those products and cannot confirm the accuracy of performance, compatibility or any other claims related to non-IBM products. Questions on the capabilities of non-IBM products should be addressed to the suppliers of those products.

This information is for planning purposes only. The information herein is subject to change before the products described become available.

This information contains examples of data and reports used in daily business operations. To illustrate them as completely as possible, the examples include the names of individuals, companies, brands, and products. All of these names are fictitious and any similarity to actual people or business enterprises is entirely coincidental.

#### COPYRIGHT LICENSE:

This information contains sample application programs in source language, which illustrate programming techniques on various operating platforms. You may copy, modify, and distribute these sample programs in any form without payment to IBM, for the purposes of developing, using, marketing or distributing application programs conforming to the application programming interface for the operating platform for which the sample programs are written. These examples have not been thoroughly tested under all conditions. IBM, therefore, cannot guarantee or imply reliability, serviceability, or function of these programs. The sample programs are provided "AS IS", without warranty of any kind. IBM shall not be liable for any damages arising out of your use of the sample programs.

## Trademarks

---

IBM, the IBM logo, and ibm.com are trademarks or registered trademarks of International Business Machines Corp., registered in many jurisdictions worldwide. Other product and service names might be trademarks of IBM or other companies. A current list of IBM trademarks is available on the web at "Copyright and trademark information" at [www.ibm.com/legal/copytrade.shtml](http://www.ibm.com/legal/copytrade.shtml).

Java and all Java-based trademarks and logos are trademarks or registered trademarks of Oracle and/or its affiliates.

The registered trademark Linux® is used pursuant to a sublicense from the Linux Foundation, the exclusive licensee of Linus Torvalds, owner of the mark on a worldwide basis.

Microsoft, Windows, Windows NT, and the Windows logo are trademarks of Microsoft Corporation in the United States, other countries, or both.

UNIX is a registered trademark of The Open Group in the United States and other countries.

Red Hat® and OpenShift® are trademarks or registered trademarks of Red Hat, Inc. or its subsidiaries in the United States and other countries.

Other product and service names might be trademark of IBM or other companies.

## Terms and conditions for product documentation

---

Permissions for the use of these publications are granted subject to the following terms and conditions.

### Applicability

These terms and conditions are in addition to any terms of use for the IBM website.

### Personal use

You may reproduce these publications for your personal, noncommercial use provided that all proprietary notices are preserved. You may not distribute, display or make derivative work of these publications, or any portion thereof, without the express consent of IBM.

### Commercial use

You may reproduce, distribute and display these publications solely within your enterprise provided that all proprietary notices are preserved. You may not make derivative works of these publications, or reproduce, distribute or display these publications or any portion thereof outside your enterprise, without the express consent of IBM.

### Rights

Except as expressly granted in this permission, no other permissions, licenses or rights are granted, either express or implied, to the publications or any information, data, software or other intellectual property contained therein.

IBM reserves the right to withdraw the permissions granted herein whenever, in its discretion, the use of the publications is detrimental to its interest or, as determined by IBM, the above instructions are not being properly followed.

You may not download, export or re-export this information except in full compliance with all applicable laws and regulations, including all United States export laws and regulations.

IBM MAKES NO GUARANTEE ABOUT THE CONTENT OF THESE PUBLICATIONS. THE PUBLICATIONS ARE PROVIDED "AS-IS" AND WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING BUT NOT LIMITED TO IMPLIED WARRANTIES OF MERCHANTABILITY, NON-INFRINGEMENT, AND FITNESS FOR A PARTICULAR PURPOSE.

## IBM Online Privacy Statement

---

IBM Software products, including software as service solutions, (“Software Offerings”) may use cookies or other technologies to collect product usage information, to help improve the end user experience, to tailor interactions with the end user or for other purposes. In many cases no personally identifiable information is collected by the Software Offerings. Some of our Software Offerings can help enable you to collect personally identifiable information. If this Software Offering uses cookies to collect personally identifiable information, specific information about this offering’s use of cookies is set forth below.

Depending upon the configurations deployed, this Software Offering may use session and persistent cookies that collect each user’s name, user name, password, or other personally identifiable information for purposes of session management, authentication, single sign-on configuration or other usage tracking or functional purposes. These cookies can be disabled, but disabling them will also likely eliminate the functionality they enable.

If the configurations deployed for this Software Offering provide you as customer the ability to collect personally identifiable information from end users via cookies and other technologies, you should seek your own legal advice about any laws applicable to such data collection, including any requirements for notice and consent.

For more information about the use of various technologies, including cookies, for these purposes, see IBM’s [Privacy Policy](http://www.ibm.com/privacy) at <http://www.ibm.com/privacy> and IBM’s [Online Privacy Statement](https://www.ibm.com/privacy/details/us/en/) at <https://www.ibm.com/privacy/details/us/en/> in the section entitled “Cookies, Web Beacons and Other Technologies”.
